Outline

2 Model

- Data
- Model specification
- 3 Estimation/Results
 - Estimation
 - Critical loss analysis
 - Results

<ロ> <四> < 回> < 回> < 回> < 回> < 回> < 回</p>

Motivation

- Market definition first step in market power assessment or in investigating the intensity of market competition.
- Why beer industry?
 - permanent growth in market concentration during last decades, primarily due to mergers
 - the relevant market considered beer in nearly all market decision in beer brewing industry

Data Model specification

<ロ> <四> < 回> < 回> < 回> < 回> < 回> < 回</p>

Procedure

- 2-stage demand estimation
- Critical Loss Analysis
- SSNIP test and on its basis definition of relevant markets

Data Model specification

Outline

- Data
- Model specification
- 3 Estimation/Results
 - Estimation
 - Critical loss analysis
 - Results

Data Model specification

- Panel scanner data from Dominick's Finer Food company (36 stores in Chicago metropolitan area)
- Weekly data from June 91 to November 95 (220 observation)
- Detrended and seasonally adjusted (temperature, holidays)

Data Model specification

Outline

- Data
- Model specification
- 3 Estimation/Results
 - Estimation
 - Critical loss analysis
 - Results

Data Model specification

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへの

Model overview

- Multi-stage budgeting, 2 levels (+ more efficient estimates;
 weak separability assumption)
- Beer brands divided into 6 segments: Premium, Light, Craft, Imported, Dark, Non-alcoholic; each containing 3-5 beer brands
- Linear approximation of Almost Ideal Demand System

Data Model specification

LA-AIDS specification

Bottom level (within segment):

$$w_{int} = \alpha_{in} + \beta_i \ln(Y_{mnt}/P_{mnt}) + \sum_{j=1}^{l} \gamma_{ij} \ln p_{jnt} + \epsilon_{int}, \qquad (1)$$

Lagged Stone index (+ avoid simultaneity bias)

$$\ln P_{mnt} = \sum_{i=1}^{l} w_{in(t-1)} \ln p_{int}.$$
 (2)

Upper level (between segment):

$$w_{mnt} = \alpha_{mn} + \beta_m \ln(Y_{bnt}/P_{bnt}) + \sum_{k=1}^{M} \gamma_{mk} \ln P_{knt} + \epsilon_{mnt}, \quad (3)$$

Estimation Critical loss analysis Results

Outline

- Data
- Model specification
- 3 Estimation/Results
 - Estimation
 - Critical loss analysis
 - Results

Estimation Critical loss analysis Results

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへの

Estimation

- SUR-GLS fixed effect estimator (capture covariances of error terms, between data variability very low)
- Haussman test in most cases suggests endogeneity, but we didn't use IV estimator ("weak instruments",price setting independent to demand shocks)

Estimation Critical loss analysis Results

Outline

- Data
- Model specification
- 3 Estimation/Results
 - Estimation
 - Critical loss analysis
 - Results

Estimation Critical loss analysis Results

CLA

First version:

- CLA calculates the level of sales, that a hypothetical monopolist could lose due to a 5-10 % price increase in order to preserve at least the level of profit before the price increase
- Break-even critical demand elasticity:Price elasticity of demand, under which the original level of profit is equal to the level of profit after the SSNIP

Estimation Critical loss analysis Results

CLA cont.

Second version:

- Profit maximizing CLA calculates the level of sales, that a hypothetical monopolist could lose due to 5-10 % price increase in order to achieve a profit-maximizing price
- Critical demand elasticity is equal to the elasticity of demand, under which the hypothetical monopolist would increase its price by at least 5-10 % in order to set its price on profit-maximizing level

Evaluation:

- ε > ε_{c,be}, then the set of products does not constitute a relevant market rendering the SSNIP not profitable.
- $\varepsilon < \varepsilon_{c,be}$, the tested set of products is the relevant market.

Craft	0.150	1.176	5.00	4.00	4.00	2.86

Relevant market isn't larger than segment

Jaroslav Bil

Summary

- Hypothetical monopolist over any one of our proposed segments would have enough market power to implement the SSNIP, making *each* of the analysed segments a *separate relevant market*.
- Competition concern might be focused on the certain segment not on all of beer.
- Limitation:
 - credibility/reliability of segment classification
 - we analyse only demand side substitution of the market (what about supply-side substitution ?)
