PROTEIN ENGINEERING

**BIOTECHNOLOGY, ENZYME APPLICATIONS, PROTEIN
ENGINEERING APPROACHES**

Radka Chaloupkova

Loschmidt Laboratories

Department of Experimental Biology

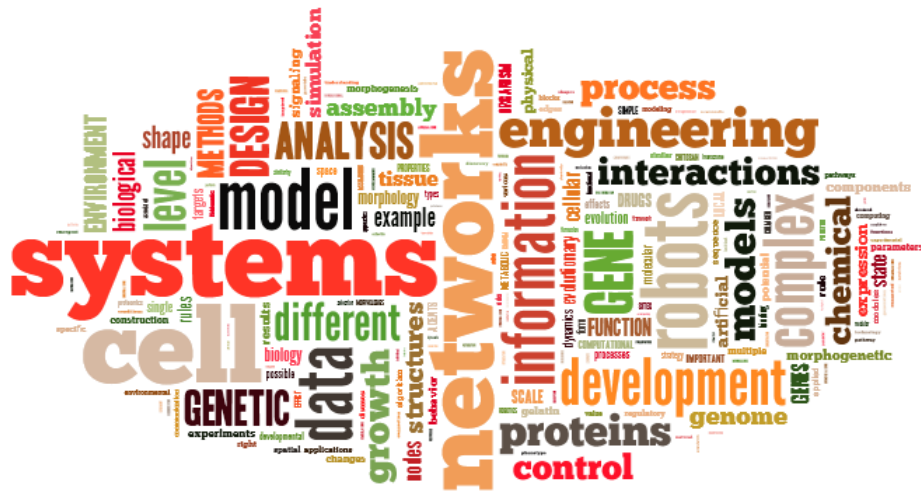

Masaryk University, Brno

Outline

- ❑ Biotechnology
- ❑ Enzymes in technologies
- ❑ Enzyme applications
- ❑ Enzyme advantages and disadvantages
- ❑ Common targets of protein engineering
- ❑ Enzymes with desired properties
- ❑ Protein engineering, strategies of protein engineering
- ❑ Examples of protein engineering

Biotechnology

- any technological application that uses biological systems, living organisms or derivatives thereof, to make or modify products or processes for specific use

Enzymes

- ❑ mostly proteins, RNA (ribozyme)
- ❑ catalysis of chemical reactions
- ❑ lowering of activation energy = increasing of reaction rate
- ❑ non toxic substances
- ❑ catalysis under mild conditions
- ❑ high efficiency, easy regulation
- ❑ high specificity (functional specificity, substrate specificity)
- ❑ requirement of cofactors (oxidoreductases, transferases)

Enzymes in technologies

❑ to manufacture both bulk and high added-value **products**

- food and animal feed
- fine chemicals
- pharmaceuticals

❑ to provide **services**

- housework
- industry
- environmental technologies
- analytical purposes
- diagnostics

Distribution of sales in **Novozymes**

Detergent industry

- ❑ **laundry** and **dishwashing** detergents
- ❑ proteases, lipases, amylases, cellulases
- ❑ enzymes reduce the environmental load of detergents products
 - save energy and CO₂ emissions by enabling lower wash temperatures
 - have no negative environmental impact on sewage treatment process
 - do not present a risk to aquatic life

Computer simulation:
A laundry detergent enzyme
(red) attacks the soil (yellow)
on a textile fiber (gray).

Food processing

- ❑ improvement of **bread** quality (alpha-amylases)
- ❑ production of **sugars** from starch (amylases)
- ❑ fruit **juice** and **wine** manufacture (pectinases, cellulases, amylases)
- ❑ **brewing** industry (enzymes from barley)
- ❑ **milk** industry (chymosin, beta-galactosidases, lactases)
- ❑ **meat** tenderizers (papain, bromelain)

Paper industry

- ❑ **xylanases** reduce bleach required for decolorizing
- ❑ **cellulases** smooth fibers and enhance water drainage
- ❑ **amylases** degrade starch to lower viscosity sugars
- ❑ **lipases** reduce pitch

Textile industry

- ❑ **cellulases** are used in denim washing for a stone-washed look
- ❑ **amylases** are used for desizing of textile fibers
- ❑ **catalases** are used for bleach clean-up
- ❑ **laccases** are used as bleaching agents

Biofuel industry

- ❑ bacterial and fungal **cellulases** break down cellulose into sugars that can be fermented

Synthesis of chemicals and pharmaceuticals

- ❑ kiloton-scale production of **acrylamide** (nitrile hydratase)
- ❑ synthesis of 6-APA – precursor of antibiotics (penicillin amidase)

- ❑ synthesis of **single enantiomers** – precursors of drugs (lipases)

Specialty enzymes

- ❑ clinical **analytical** applications
 - glucose biosensor (glucose oxidase)
 - alkaline phosphatase and peroxidase immunoassays
- ❑ **flavor** production
 - production of glutamates used in food flavouring (glutamases)
- ❑ **personal care** products
 - contact lens cleaning (lipase, proteinase)
 - in toothpaste to convert glucose to H_2O_2 (glucose oxidase)
- ❑ **DNA** technology
 - restriction enzymes (restriction endonuclease)
 - DNA-modifying enzymes (ligase)

- ❑ use of microorganisms or their enzymes to return the **environment** altered by contaminants to its original condition
- ❑ examples of biodegradation **enzymes and pollutants**
 - monooxygenases – alkane, steroids, fatty acid and aromatic compounds
 - dioxygenases – phenolic and aromatic compounds
 - peroxidases – lignin and other phenolic compounds
 - lipases – organic pollutants such as oil spill
 - cellulases – cellulosic substances
 - haloalkane dehalogenases – halogenated hydrocarbons
 - proteases – proteins

Advantages of enzymes

- ❑ high catalytic **efficiency**
- ❑ high degree of **selectivity**
- ❑ **compatibility** of each other
- ❑ **reusability**
- ❑ **sustainability**
 - produced from biomass
 - easily biodegradable
 - non-toxic and non-flammable
 - less byproducts and wastes
 - operate at mild conditions

Disadvantages of enzymes

- ❑ generally **less stable**
- ❑ insufficient **activity**
- ❑ insufficient **selectivity**
- ❑ **cofactor** requirement
- ❑ **allergies**

Common targets of protein engineering

- enzyme **stability**
- enzyme **activity**
- enzyme **substrate specificity**
- enzyme **enantioselectivity**

Enzyme stability

□ thermodynamic x kinetic stability

Definitions of various stability parameters.

Measure	Symbol	Type of stability	Definition
Free energy of unfolding	ΔG_u	Thermodynamic	Change in Gibbs free energy going from the folded to unfolded state
Melting temperature	T_m	Thermodynamic	The temperature at which half of the protein is in the unfolded state
Unfolding equilibrium constant	K_u	Thermodynamic	The concentration of unfolded species divided by the concentration of folded species
Half-concentration	$C_{1/2}$	Thermodynamic	The concentration of denaturant needed to unfold half of the protein (chemical equivalent of T_m)
Observed deactivation rate constant	$k_{d,obs}$	Kinetic	Overall rate constant for going from native to deactivation species
Half-life	$\tau_{1/2}$	Kinetic	Time required for residual activity to be reduced to half
Temperature of half-inactivation	T_{50}	Kinetic	Temperature of incubation to reduce residual activity by half during a defined time period
Optimum temperature	T_{opt}	Kinetic	Temperature leading to highest activity
Total turnover number	TTN	Kinetic	Moles of product produced over the lifetime of the catalyst

Enzyme stability

CD spectra

Half-life

Melting temperature

Half-concentration

Enzyme activity

- ❑ enzyme property measured by the increase in reaction rate
- ❑ reaction rate – concentration of product produced per time

Enzyme activity

Units of enzyme activity

- ❑ **SI unit, katal (kat)** – amount of enzyme that catalyzes conversion of 1 mole of substrate per second ($\text{mol}\cdot\text{s}^{-1}$)
- ❑ **activity unit (U)** – amount of enzyme that catalyzes conversion of $1\mu\text{mol}$ of substrate per minute ($\mu\text{mol}\cdot\text{min}^{-1}$),
 $1\text{U} = 16.67\text{ nkat}$
- ❑ **specific activity** – activity of enzyme per milligram of total protein ($\mu\text{mol}\cdot\text{s}^{-1}\cdot\text{mg}^{-1}$)

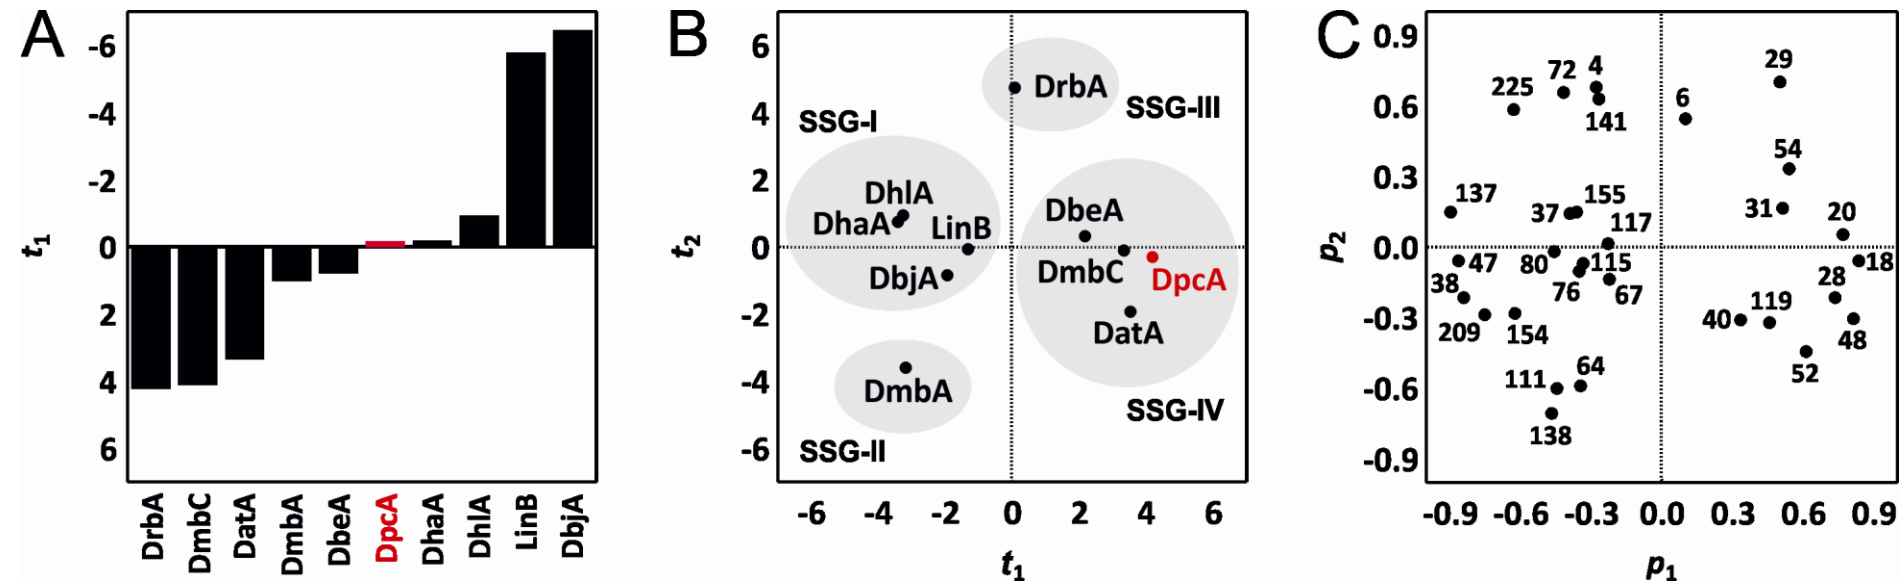

Enzyme substrate specificity

- ❑ definition of substrate specificity – **discrimination between several substrates competing for enzyme active site**
- ❑ commonly used meaning – enzyme activity with alternative substrate in the absence of specific (native) substrate
- ❑ enzyme activity measured towards a broad range of substrates under similar conditions
- ❑ fingerprint of enzyme ability to convert various substrates
- ❑ usually compared for different enzymes
- ❑ quantitative comparison of enzyme data – statistical analysis

Enzyme substrate specificity

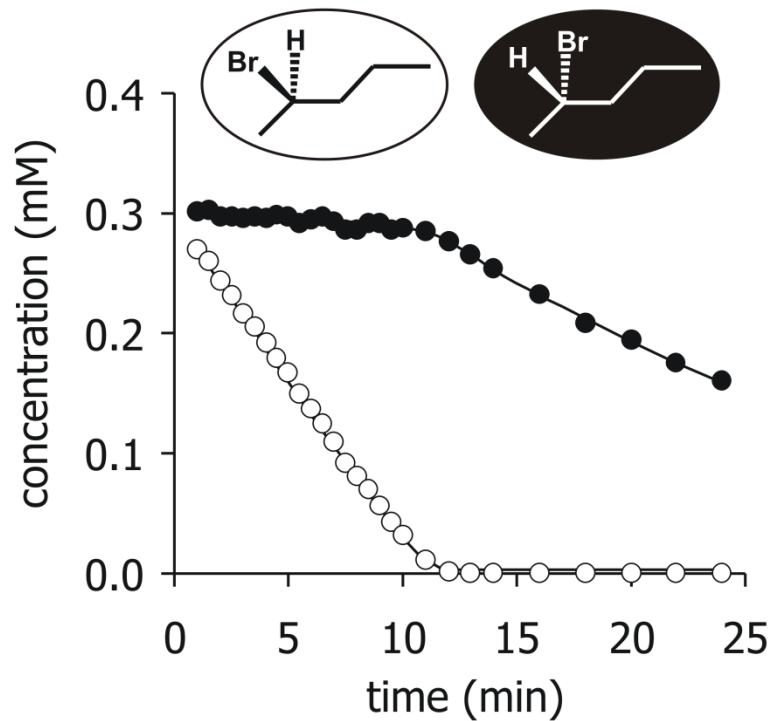

- statistical analysis of substrate specificity data – sorting of enzymes according to their preference to different substrates
- identification of unique SSGs within one enzyme family

SSG – substrate specificity group

Enzyme enantioselectivity

- ❑ discrimination between enantiomeric substrates or products
- ❑ preferential conversion of one enantiomer of chiral substrate

Enzyme enantioselectivity

- ❑ discrimination between enantiomeric substrates or products
- ❑ preferential conversion of one enantiomer of chiral substrate

dopa

(R)- causes granulocytopenia
***(S)*- anti-parkinson**

ethambutol

(R,R)- causes blindness
***(S,S)*- tuberculostatic**

Enzyme enantioselectivity

- characterized by **enantiomeric ratio E**

$$E = \frac{k_{\text{cat}}^{(R)} / K_{\text{m}}^{(R)}}{k_{\text{cat}}^{(S)} / K_{\text{m}}^{(S)}}$$

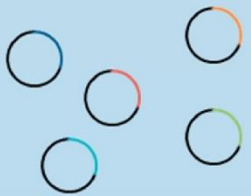

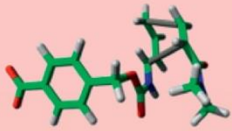

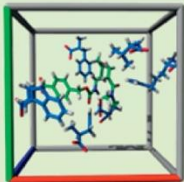

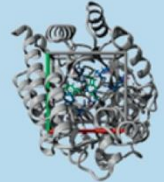

- E – description how the enzyme discriminates between the enantiomers of a substance under given reaction conditions
- E – intrinsic property of a given system consisting of the enzyme, its substrate and the environment
- E – strongly affected by the environment (T, pH, solvents, ...)

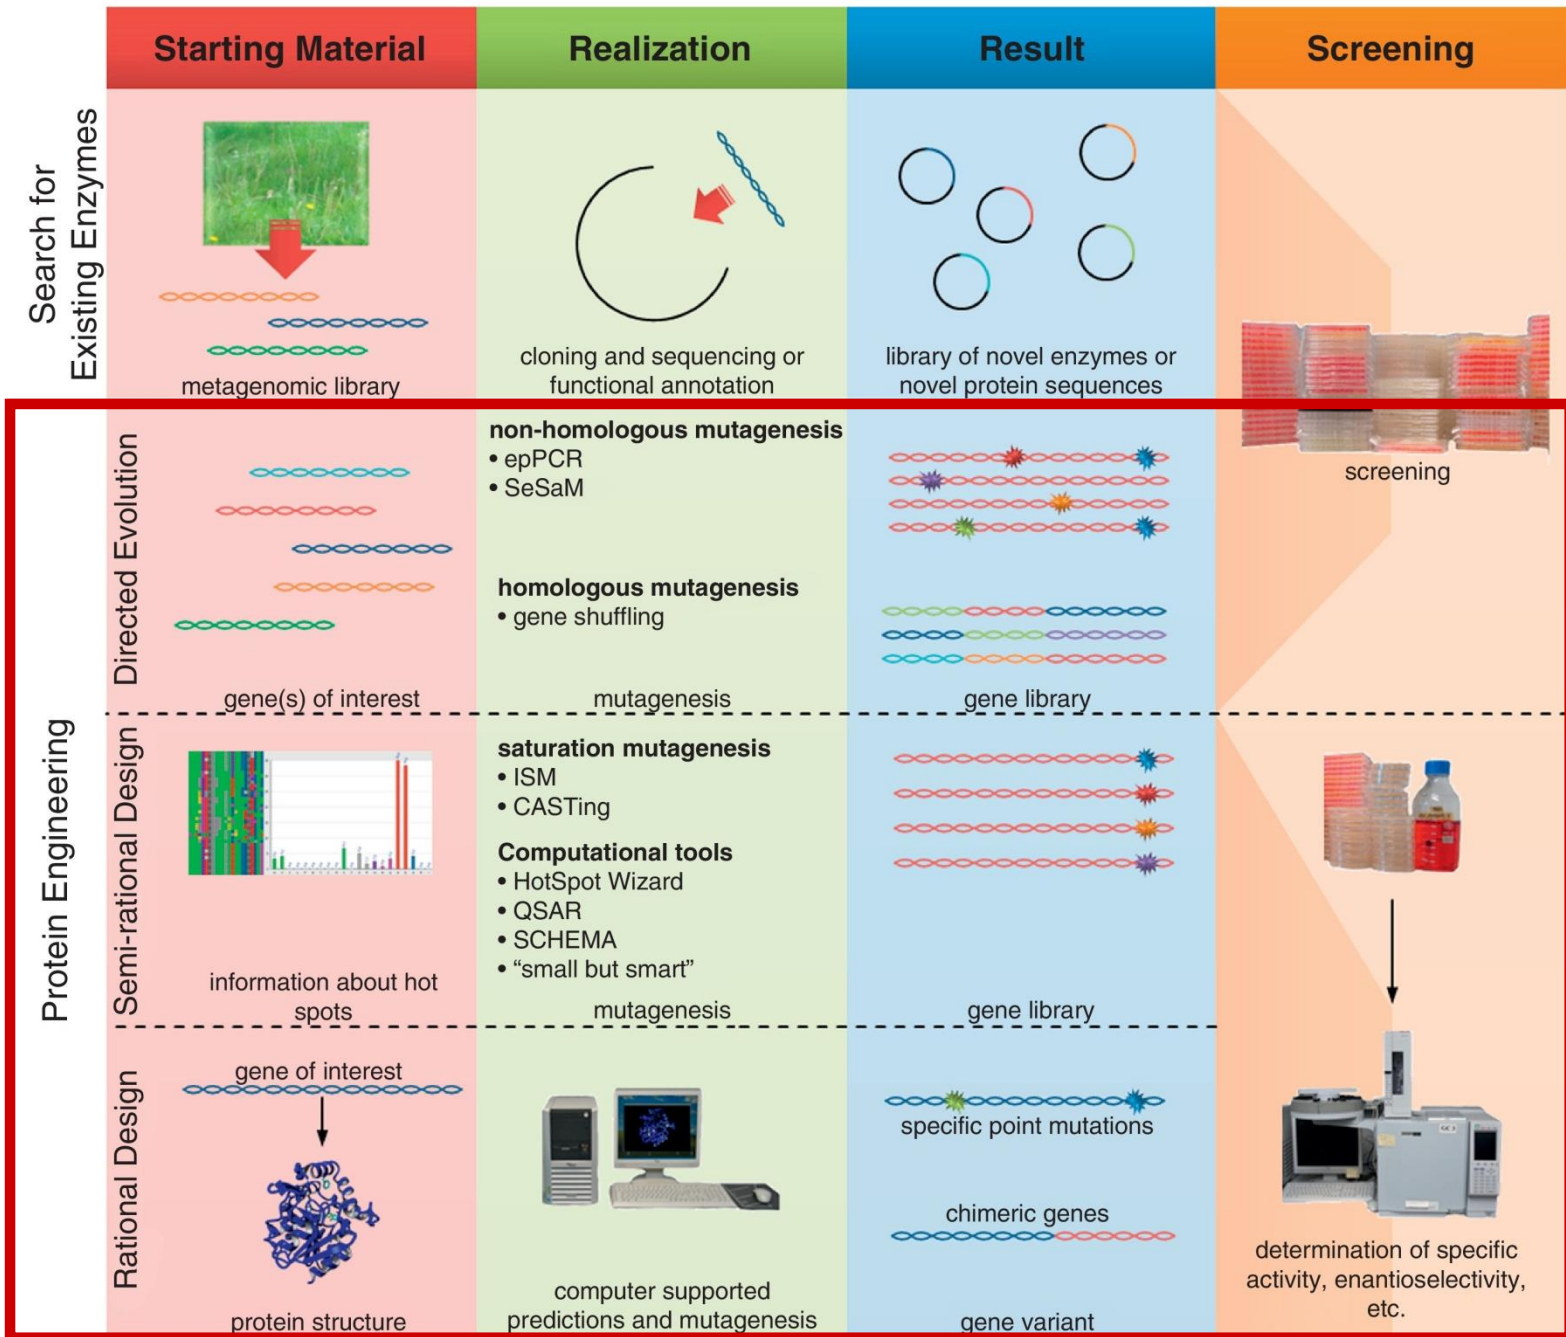

Process design criteria

- higher activity at process conditions
- increased process stability
- increased thermostability to run at higher temperatures
- stability to organic solvents
- absence of substrate and/or product inhibition
- increased selectivity (enantio-, regio-, chemo-)
- accept new substrate
- catalyse new reactions

Enzymes with desired properties

- concepts used to identify/create enzymes with desired properties

	Starting Material	Realization	Result	Screening
Database Search	 <p>structural information and prediction of key motifs</p>	<pre>gene1: ..HIYQ..PRAHQF gene2: ..YIRP..RMGVVP gene3: ..FVER..GVRGTR gene4: ..FVEL..GVRGSR</pre> <p>database search</p>	 <p>library of novel enzymes novel protein sequences</p>	 <p>determination of specific activity, enantioselectivity, etc.</p>
de novo Design	 <p>define transition state for the desired reaction</p>	 <p>propose an active site able to stabilize that transition state QM/MM modeling</p>	 <p>accommodate the active site into an existing scaffold ROSETTA algorithm</p>	 <p>determination of specific activity, enantioselectivity, etc.</p>

Protein engineering

- ❑ altering the structure of existing protein to improve its properties
- ❑ overcome limitations of natural enzymes as catalysts
- ❑ basic understanding of how enzymes function and have evolved
- ❑ already point to many industrial successes

- ❑ *"in the past, an enzyme-based process was designed around the limitations of the enzymes; today, the enzyme is engineered to fit the process specifications"*

Protein engineering

- three main approaches of protein engineering
 - **rational design**
 - **directed evolution**
 - **semi-rational design**

Rational design

RATIONAL DESIGN

1. Computer aided design

2. Site-directed mutagenesis

Individual mutated gene

3. Transformation

4. Protein expression

5. Protein purification

6. *not applied*

Constructed mutant enzyme

**IMPROVED
ENZYME**

7. Biochemical testing

- ❑ **site-specific changes on the target enzyme**
- ❑ few amino-acid substitutions that are predicted to elicit desired improvements of enzyme function
- ❑ **based on detailed knowledge of protein structure, function and catalytic mechanism**
- ❑ relatively simple characterization of constructed variants
- ❑ factor limiting general application of rational design – complexity of structure-function relationship in enzymes

DIRECTED EVOLUTION

1. *not applied*

2. Random mutagenesis

Library of mutated genes
(>10,000 clones)

3. Transformation

4. Protein expression

5. *not applied*

6. Screening and selection

- stability
- selectivity
- affinity
- activity

Selected mutant enzymes

7. Biochemical testing

**IMPROVED
ENZYME**

Directed evolution

- ❑ **large numbers of mutants randomly generated**
- ❑ mimicking natural evolution processes
- ❑ evolution without knowledge of enzyme structure and function
- ❑ **identification of functionally improved variants required powerful screening or selection**
- ❑ limitation – necessity of developing a high-throughput screening

Semi-rational design

RATIONAL DESIGN

1. Computer aided design

2. Site-directed mutagenesis

Individual mutated gene

3. Transformation

4. Protein expression

5. Protein purification

6. *not applied*

Constructed mutant enzyme

DIRECTED EVOLUTION

1. *not applied*

2. Random mutagenesis

Library of mutated genes
(>10,000 clones)

3. Transformation

4. Protein expression

5. *not applied*

6. Screening and selection

- stability
- selectivity
- affinity
- activity

Selected mutant enzymes

**IMPROVED
ENZYME**

7. Biochemical testing

Semi-rational design

- ❑ also called focused directed evolution
- ❑ based on knowledge of structure and function of target enzyme
- ❑ **combine** advantages of **rational and random approaches**
- ❑ **selection of promising target sites**
- ❑ **creation of** small focused **“smart” libraries**
- ❑ elimination the need of high-throughput screening
- ❑ increase likelihood of beneficially modifying property

Protein engineering approaches

Comparison of protein engineering approaches

	Rational design	Directed evolution	Semi-rational design
high-throughput screening/selection	not essential	essential	advantageous but not essential
structural and/or functional information	both essential	neither essential	either is sufficient
sequence space exploration	low	high, random	moderate, targeted
probability to obtain synergistic mutations	moderate	low	high

Process design criteria

- ❑ **higher activity at process conditions**
- ❑ **increased process stability**
- ❑ **increased thermostability** to run at higher temperatures
- ❑ **stability to organic solvents**
- ❑ absence of substrate and/or product inhibition
- ❑ increased selectivity (enantio-, regio-, chemo-)
- ❑ accept new substrate
- ❑ catalyse new reactions

Target enzyme family

- ❑ **haloalkane dehalogenases (HLDs)**
- ❑ microbial enzymes – α/β hydrolases¹
- ❑ hydrolytic cleavage of C-X bond

- ❑ broad substrate specificity
- ❑ high enantioselectivity
- ❑ potential applications: biodegradation, biosensing, biosynthesis

Conclusion I

- ❑ **resistance** towards organic cosolvents **correlates with thermostability**
- ❑ mutations lining access tunnel modulate **occupancy** of active site by solvent and can **stabilize** protein
- ❑ robust catalysts (DhaA80) were developed:
4 point mutations, $T_m \uparrow$ **19 °C**, $\tau_{1/2}$ (40% DMSO) **min** → **days**
- ❑ **engineering of access tunnels represents novel strategy for engineering of robust catalysts**

DhaA80

- ❑ 4 point mutations: T148L, G171Q, A172V and C176F
- ❑ $\tau_{1/2}$ (40% DMSO) **improved 4000-fold**
- ❑ $\Delta T_m = \mathbf{16\text{ }^\circ\text{C}}$
- ❑ **very low activity** in buffer

Conclusion II

- ❑ enzyme catalytic performance enhanced by fine-tuning the geometry and flexibility of its access tunnel
- ❑ **tunnel residues are good targets to balance activity-stability trade-off of enzymes**
