

Homework 5

Instructions

Upload this homework into the homework vaults in the IS no later than on 5/5 at 23.59. The homework submitted after this date can be evaluated only if you have an excuse in the IS for at least 3 working days in the week between the given lectures and seminars (from these five: Wed, Thu, Fri, Mon, Tue) and the teacher has given you an alternative date when you submit your homework. We expect that you write the homework on your own. Should your answers resemble with the answers in someone else's homework, we might deduct points from your score. We appreciate the effort and thorough thinking (whether your answers make sense, whether you have supported all your claims by careful argumentation, whether your answers are informed by data). Try to formulate ideas as concisely as possible. Certainly do not add any "dummy text" just in order to get closer to the maximum extent. The final document can be inserted into the System in all standard formats (doc, docx, odt, pdf, ...). Title the document Homework 5 (your name and surname will be added to the name of the document automatically).

Task (6 points, maximum 500 words)

Read the paper by Normann (2011) (see the study materials). Answer the following questions. Please, use your own formulations. Do not copy sentences or formulations from the paper:

1. What is the aim of the paper?
2. What is the problem with the OSS (1990) model? How do they reply to the critique?
3. Explain carefully the difference between foreclosure in narrow and broad sense.
4. How many and what treatments are used in the experiment? Suppose that the narrow definition of foreclosure is valid. What results would you expect in these treatments?
5. Why does the author have different number of sessions with random matching and fixed matching?
6. Interpret the results in the table 4. Does it fit to a broadly or narrowly defined foreclosure?
