Chapter 22

Cost Curves

Types of Cost Curves

- ◆ **A total cost curve is the graph of a firm's total cost function.**
- ◆ **A variable cost curve is the graph of a firm's variable cost function.**
- ◆ **An average total cost curve is the graph of a firm's average total cost function.**

Types of Cost Curves

- ◆ **An average variable cost curve is the graph of a firm's average variable cost function.**
- ◆ **An average fixed cost curve is the graph of a firm's average fixed cost function.**
- ◆ **A marginal cost curve is the graph of a firm's marginal cost function.**

Types of Cost Curves

- ◆ **How are these cost curves related to each other?**
- ◆ **How are a firm's long-run and short-run cost curves related?**

Fixed, Variable & Total Cost Functions

- ◆ **F is the total cost to a firm of its short-run fixed inputs. F , the firm's fixed cost, does not vary with the firm's output level.**
- ◆ **$c_v(y)$ is the total cost to a firm of its variable inputs when producing y output units. $c_v(y)$ is the firm's variable cost function.**
- ◆ **$c_v(y)$ depends upon the levels of the fixed inputs.**

Fixed, Variable & Total Cost Functions

- ◆ **$c(y)$ is the total cost of all inputs, fixed and variable, when producing y output units. $c(y)$ is the firm's total cost function;**

$$c(y) = F + c_v(y).$$

\$

F

y

\$

$c_v(y)$

y

\$

$c_v(y)$

F

y

Av. Fixed, Av. Variable & Av. Total Cost Curves

- ◆ The firm's total cost function is
 $c(y) = F + c_v(y)$.

For $y > 0$, the firm's average total
cost function is

$$\begin{aligned} AC(y) &= \frac{F}{y} + \frac{c_v(y)}{y} \\ &= AFC(y) + AVC(y). \end{aligned}$$

Av. Fixed, Av. Variable & Av. Total Cost Curves

- ◆ **What does an average fixed cost curve look like?**

$$AFC(y) = \frac{F}{y}$$

- ◆ **AFC(y) is a rectangular hyperbola so its graph looks like ...**

\$/output unit

0

y

Av. Fixed, Av. Variable & Av. Total Cost Curves

- ◆ **In a short-run with a fixed amount of at least one input, the Law of Diminishing (Marginal) Returns must apply, causing the firm's average variable cost of production to increase eventually.**

\$/output unit

0

y

AVC(y)

\$/output unit

Av. Fixed, Av. Variable & Av. Total Cost Curves

◆ And $ATC(y) = AFC(y) + AVC(y)$

\$/output unit

$$\mathbf{ATC(y) = AFC(y) + AVC(y)}$$

ATC(y)

AVC(y)

AFC(y)

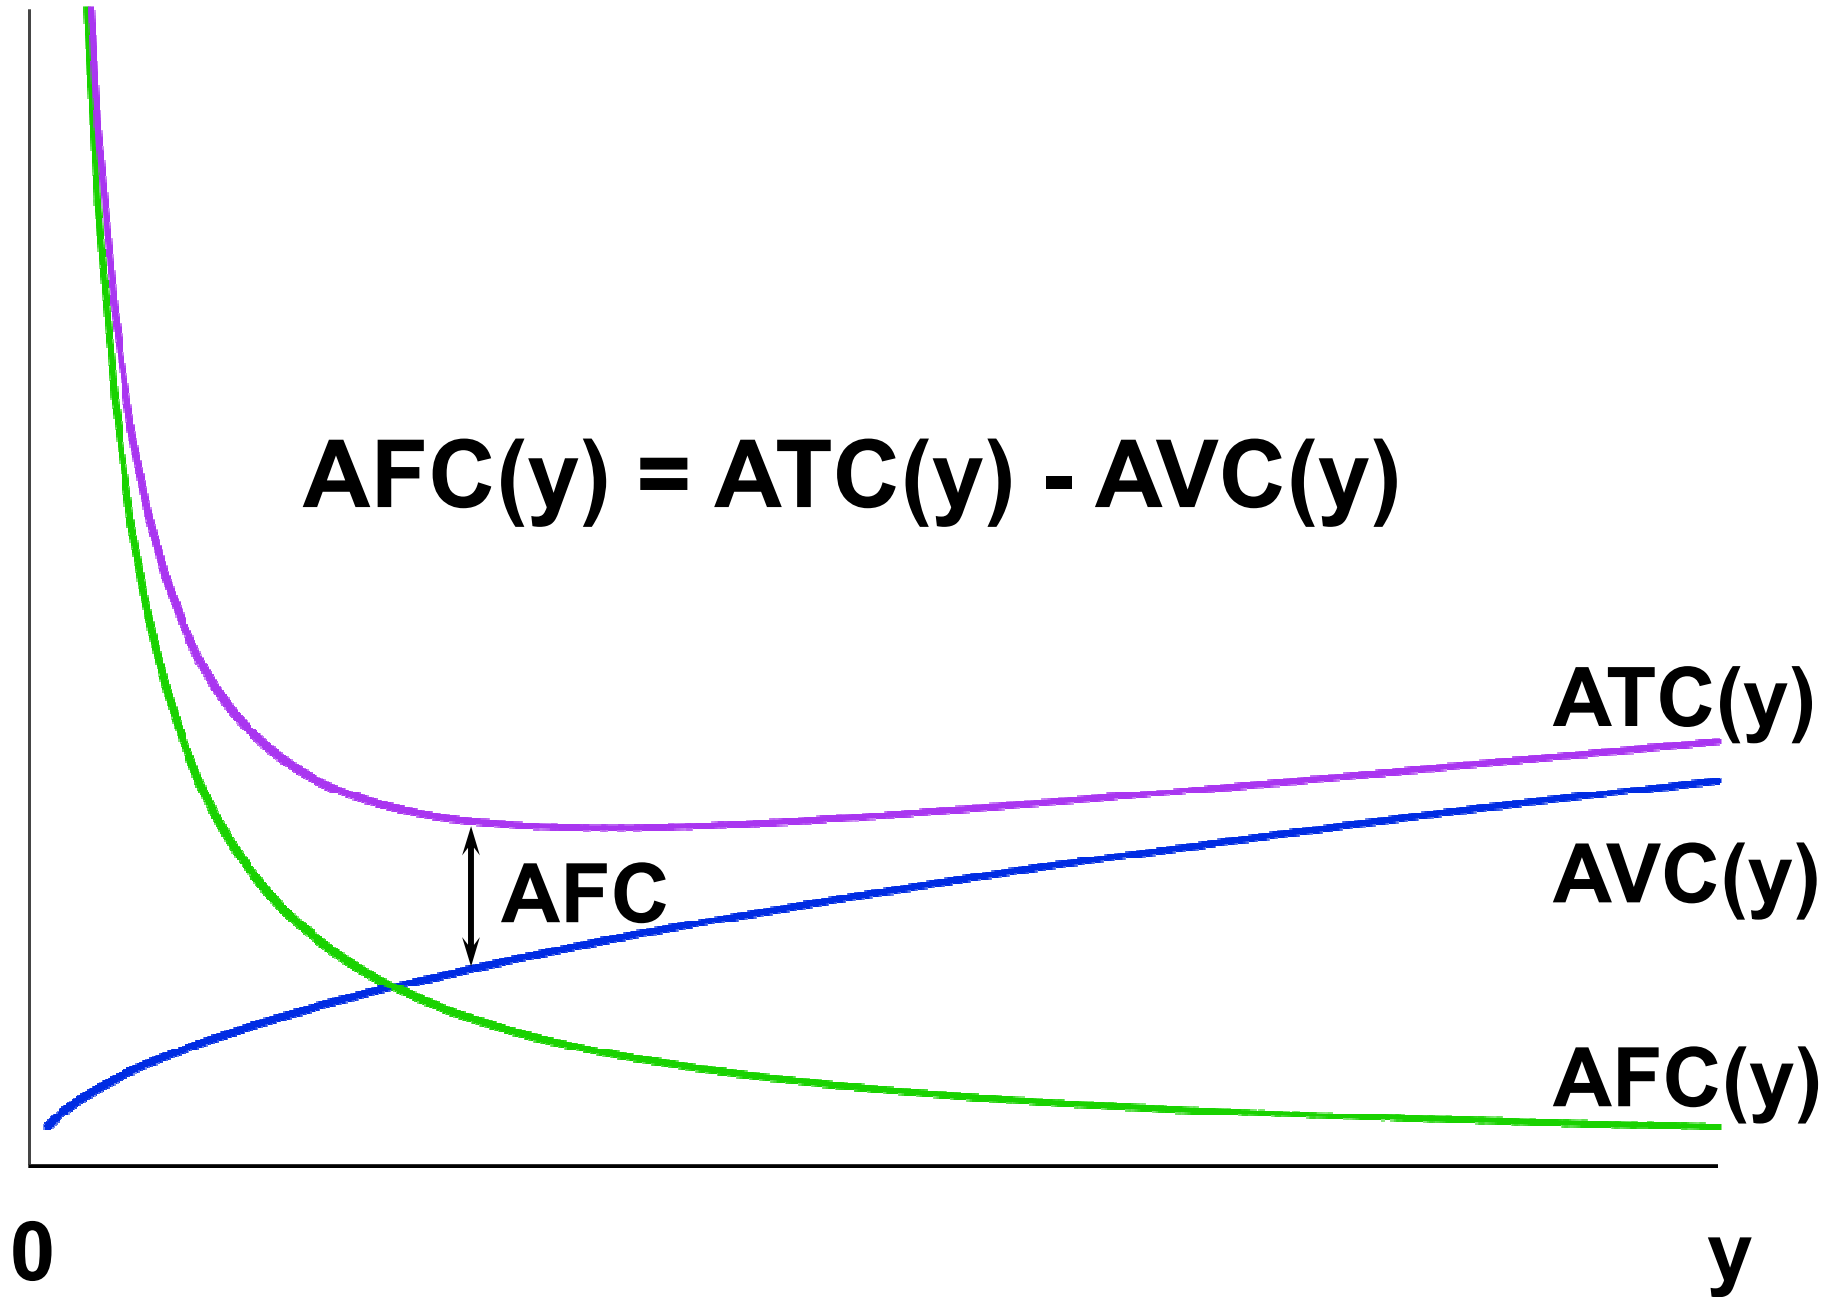

0

y

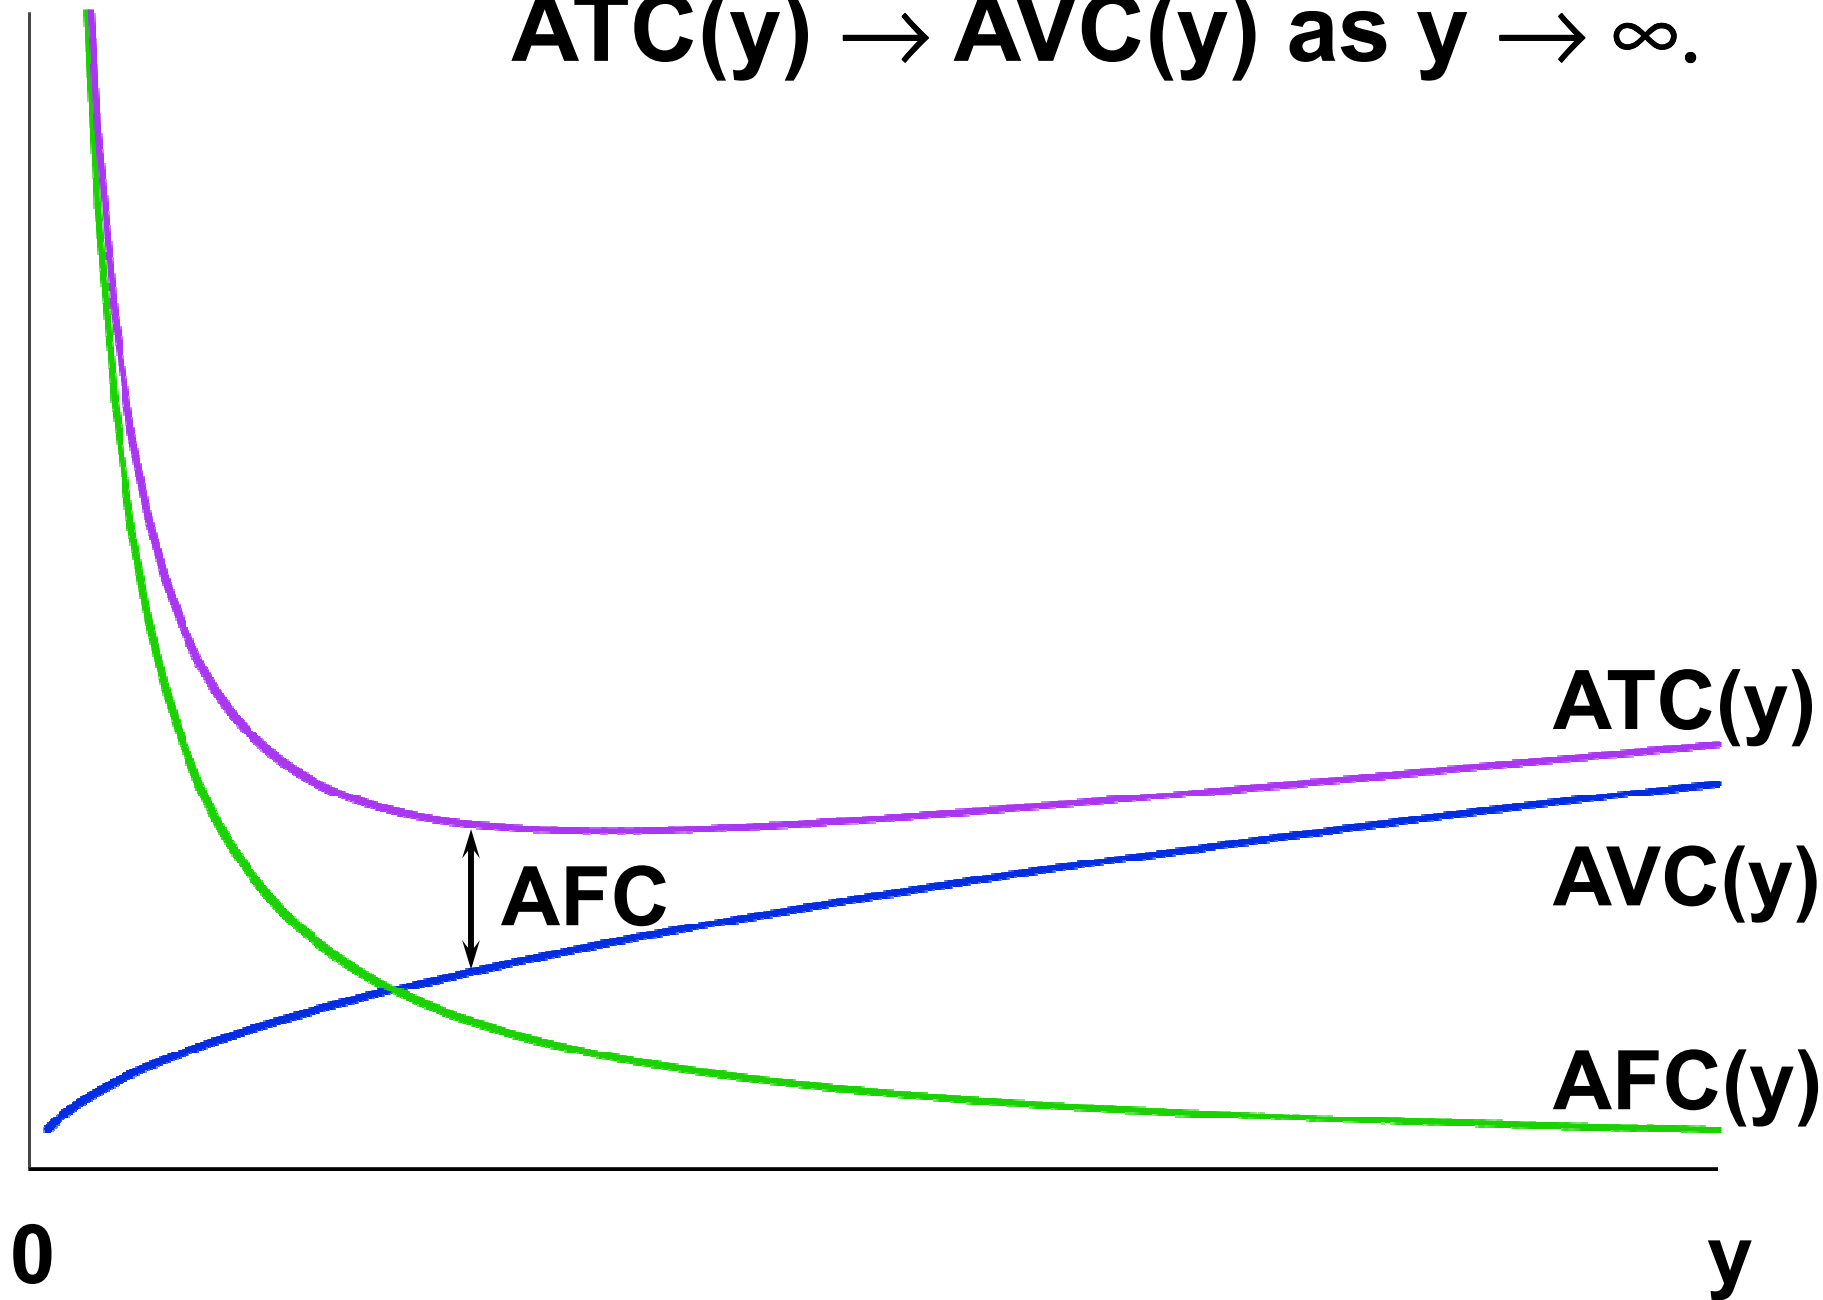

\$/output unit

$$\mathbf{AFC(y) = ATC(y) - AVC(y)}$$

\$/output unit

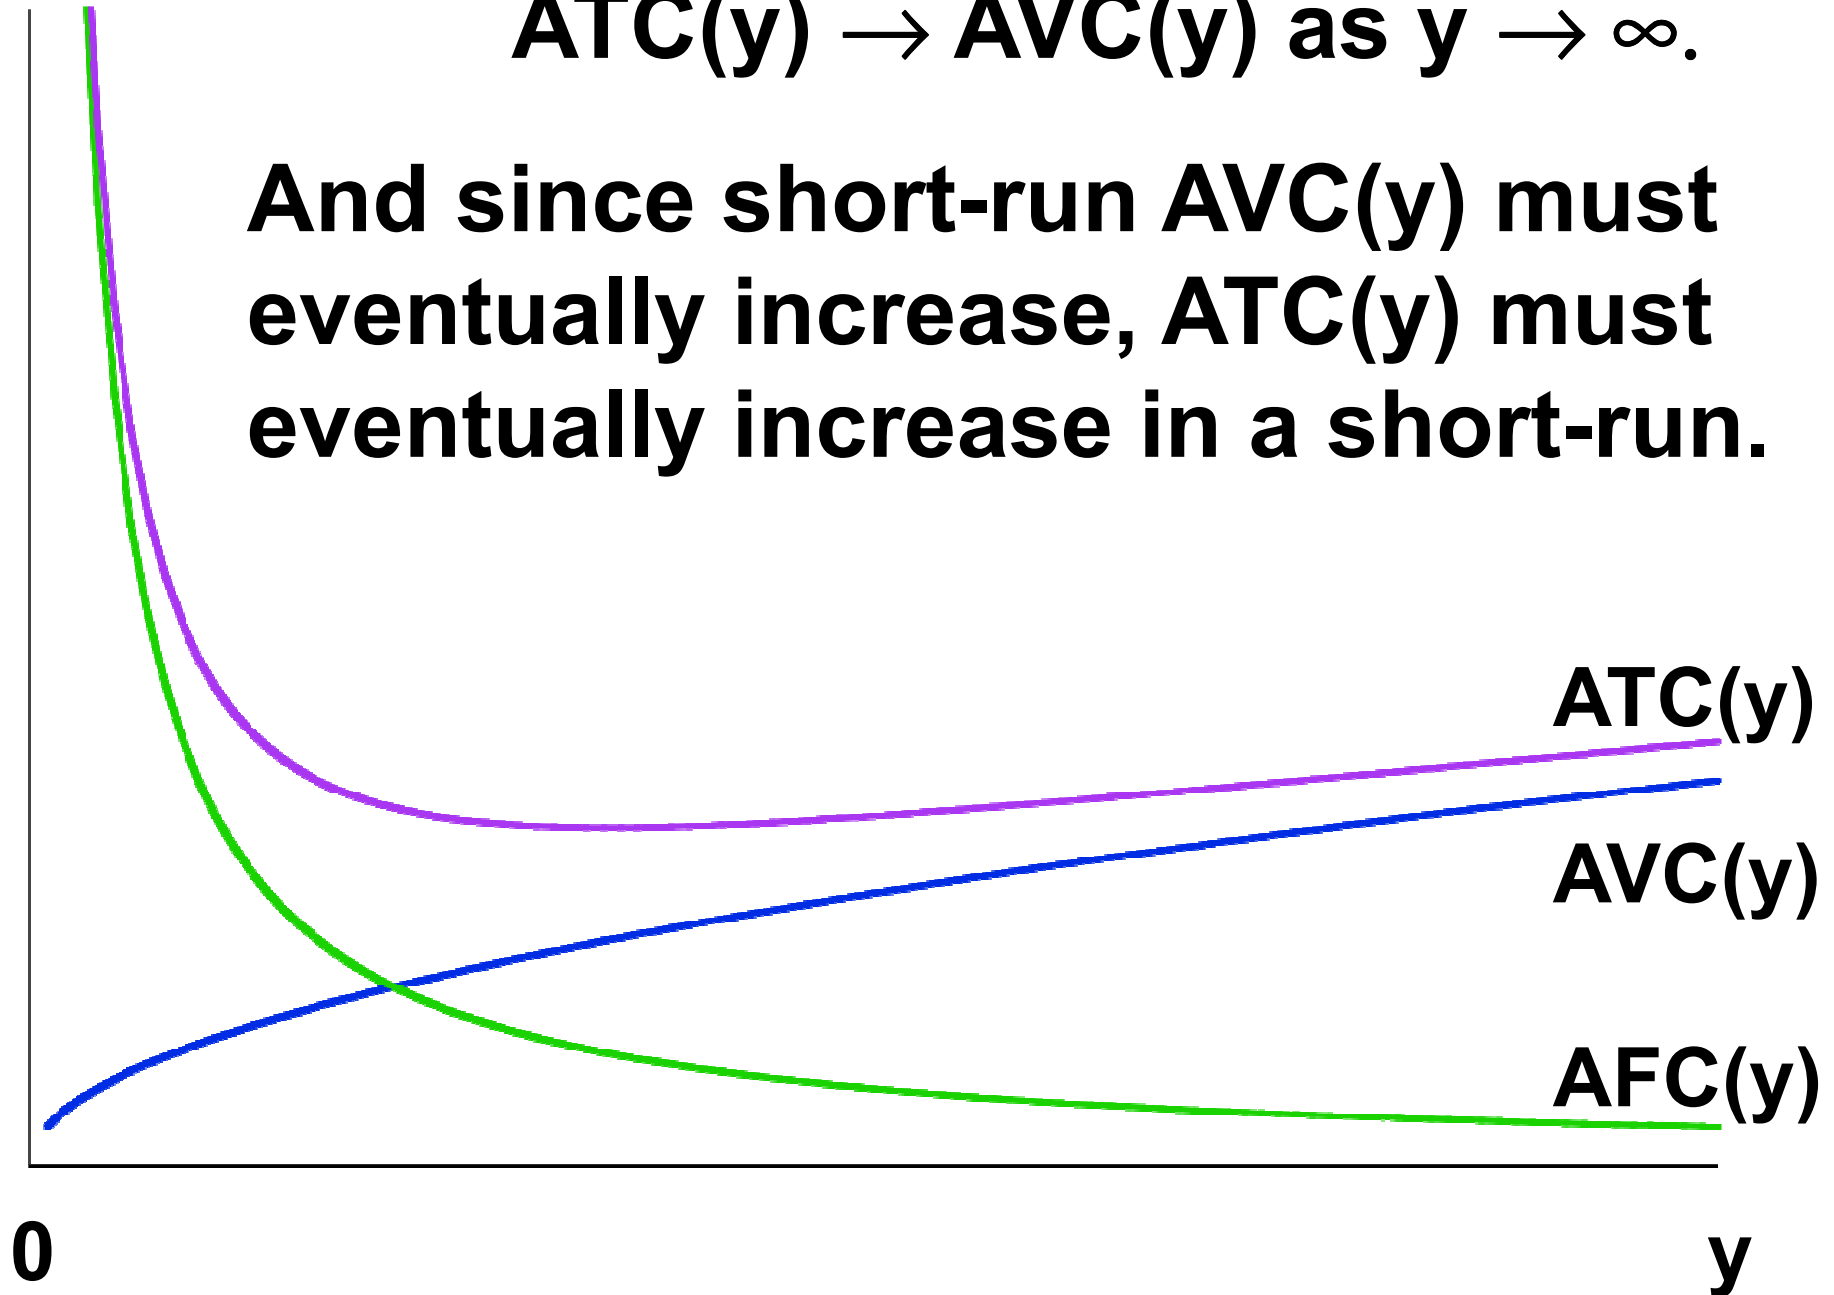

**Since $AFC(y) \rightarrow 0$ as $y \rightarrow \infty$,
 $ATC(y) \rightarrow AVC(y)$ as $y \rightarrow \infty$.**

\$/output unit

**Since $AFC(y) \rightarrow 0$ as $y \rightarrow \infty$,
 $ATC(y) \rightarrow AVC(y)$ as $y \rightarrow \infty$.**

**And since short-run $AVC(y)$ must
eventually increase, $ATC(y)$ must
eventually increase in a short-run.**

Marginal Cost Function

- ◆ **Marginal cost is the rate-of-change of variable production cost as the output level changes. That is,**

$$\text{MC}(y) = \frac{\partial c_v(y)}{\partial y}.$$

Marginal Cost Function

- ◆ The firm's total cost function is
$$c(y) = F + c_v(y)$$

and the fixed cost F does not change with the output level y , so

$$MC(y) = \frac{\partial c_v(y)}{\partial y} = \frac{\partial c(y)}{\partial y}.$$

- ◆ MC is the slope of both the variable cost and the total cost functions.

Marginal and Variable Cost Functions

- ◆ **Since $MC(y)$ is the derivative of $c_v(y)$, $c_v(y)$ must be the integral of $MC(y)$.**

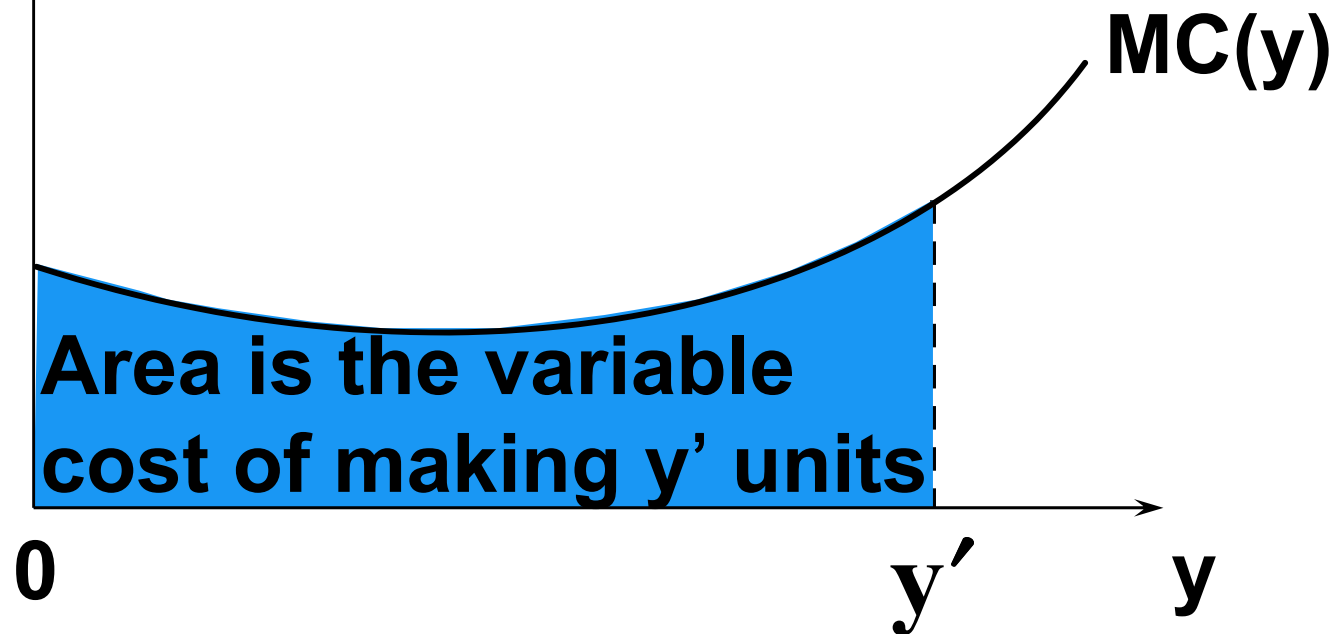

That is, $MC(y) = \frac{\partial c_v(y)}{\partial y}$

$$\Rightarrow c_v(y) = \int_0^y MC(z) dz.$$

Marginal and Variable Cost Functions

\$/output unit

$$c_v(y') = \int_0^{y'} MC(z) dz$$

Marginal & Average Cost Functions

- ◆ **How is marginal cost related to average variable cost?**

Marginal & Average Cost Functions

Since $AVC(y) = \frac{c_v(y)}{y},$

$$\frac{\partial AVC(y)}{\partial y} = \frac{y \times MC(y) - 1 \times c_v(y)}{y^2}.$$

Marginal & Average Cost Functions

Since $AVC(y) = \frac{c_v(y)}{y},$

$$\frac{\partial AVC(y)}{\partial y} = \frac{y \times MC(y) - 1 \times c_v(y)}{y^2}.$$

Therefore,

$$\frac{\partial AVC(y)}{\partial y} \begin{matrix} > \\ = \\ < \end{matrix} 0 \quad \text{as} \quad y \times MC(y) \begin{matrix} > \\ = \\ < \end{matrix} c_v(y).$$

Marginal & Average Cost Functions

Since $AVC(y) = \frac{c_v(y)}{y},$

$$\frac{\partial AVC(y)}{\partial y} = \frac{y \times MC(y) - 1 \times c_v(y)}{y^2}.$$

Therefore,

$$\frac{\partial AVC(y)}{\partial y} \begin{matrix} > \\ = \\ < \end{matrix} 0 \quad \text{as} \quad y \times MC(y) \begin{matrix} > \\ = \\ < \end{matrix} c_v(y).$$

$$\frac{\partial AVC(y)}{\partial y} \begin{matrix} > \\ = \\ < \end{matrix} 0 \quad \text{as} \quad MC(y) \begin{matrix} > \\ = \\ < \end{matrix} \frac{c_v(y)}{y} = AVC(y).$$

Marginal & Average Cost Functions

$$\frac{\partial \text{AVC}(y)}{\partial y} \begin{matrix} > \\ = 0 \\ < \end{matrix} \text{ as } \text{MC}(y) \begin{matrix} > \\ = \\ < \end{matrix} \text{AVC}(y).$$

\$/output unit

\$/output unit

$$\mathbf{MC(y) < AVC(y) \Rightarrow \frac{\partial AVC(y)}{\partial y} < 0}$$

\$/output unit

$$\mathbf{MC(y) > AVC(y) \Rightarrow \frac{\partial AVC(y)}{\partial y} > 0}$$

\$/output unit

$$\mathbf{MC(y) = AVC(y) \Rightarrow \frac{\partial AVC(y)}{\partial y} = 0}$$

\$/output unit

$$\mathbf{MC(y) = AVC(y) \Rightarrow \frac{\partial AVC(y)}{\partial y} = 0}$$

The short-run MC curve intersects the short-run AVC curve from below at the AVC curve's minimum.

Marginal & Average Cost Functions

Similarly, since $ATC(y) = \frac{c(y)}{y}$,

$$\frac{\partial ATC(y)}{\partial y} = \frac{y \times MC(y) - 1 \times c(y)}{y^2}.$$

Marginal & Average Cost Functions

Similarly, since $ATC(y) = \frac{c(y)}{y}$,

$$\frac{\partial ATC(y)}{\partial y} = \frac{y \times MC(y) - 1 \times c(y)}{y^2}.$$

Therefore,

$$\frac{\partial ATC(y)}{\partial y} \begin{matrix} > \\ = \\ < \end{matrix} 0 \quad \text{as} \quad y \times MC(y) \begin{matrix} > \\ = \\ < \end{matrix} c(y).$$

Marginal & Average Cost Functions

Similarly, since $ATC(y) = \frac{c(y)}{y}$,

$$\frac{\partial ATC(y)}{\partial y} = \frac{y \times MC(y) - 1 \times c(y)}{y^2}.$$

Therefore,

$$\frac{\partial ATC(y)}{\partial y} \begin{matrix} > \\ = \\ < \end{matrix} 0 \quad \text{as} \quad y \times MC(y) \begin{matrix} > \\ = \\ < \end{matrix} c(y).$$

$$\frac{\partial ATC(y)}{\partial y} \begin{matrix} > \\ = \\ < \end{matrix} 0 \quad \text{as} \quad MC(y) \begin{matrix} > \\ = \\ < \end{matrix} \frac{c(y)}{y} = ATC(y).$$

\$/output unit

$$\frac{\partial \text{ATC}(y)}{\partial y} \begin{matrix} > \\ = \\ < \end{matrix} 0 \quad \text{as} \quad \text{MC}(y) \begin{matrix} > \\ = \\ < \end{matrix} \text{ATC}(y)$$

Marginal & Average Cost Functions

- ◆ **The short-run MC curve intersects the short-run AVC curve from below at the AVC curve's minimum.**
- ◆ **And, similarly, the short-run MC curve intersects the short-run ATC curve from below at the ATC curve's minimum.**

\$/output unit

Short-Run & Long-Run Total Cost Curves

- ◆ A firm has a different short-run total cost curve for each possible short-run circumstance.
- ◆ Suppose the firm can be in one of just three short-runs;

$$x_2 = x_2'$$

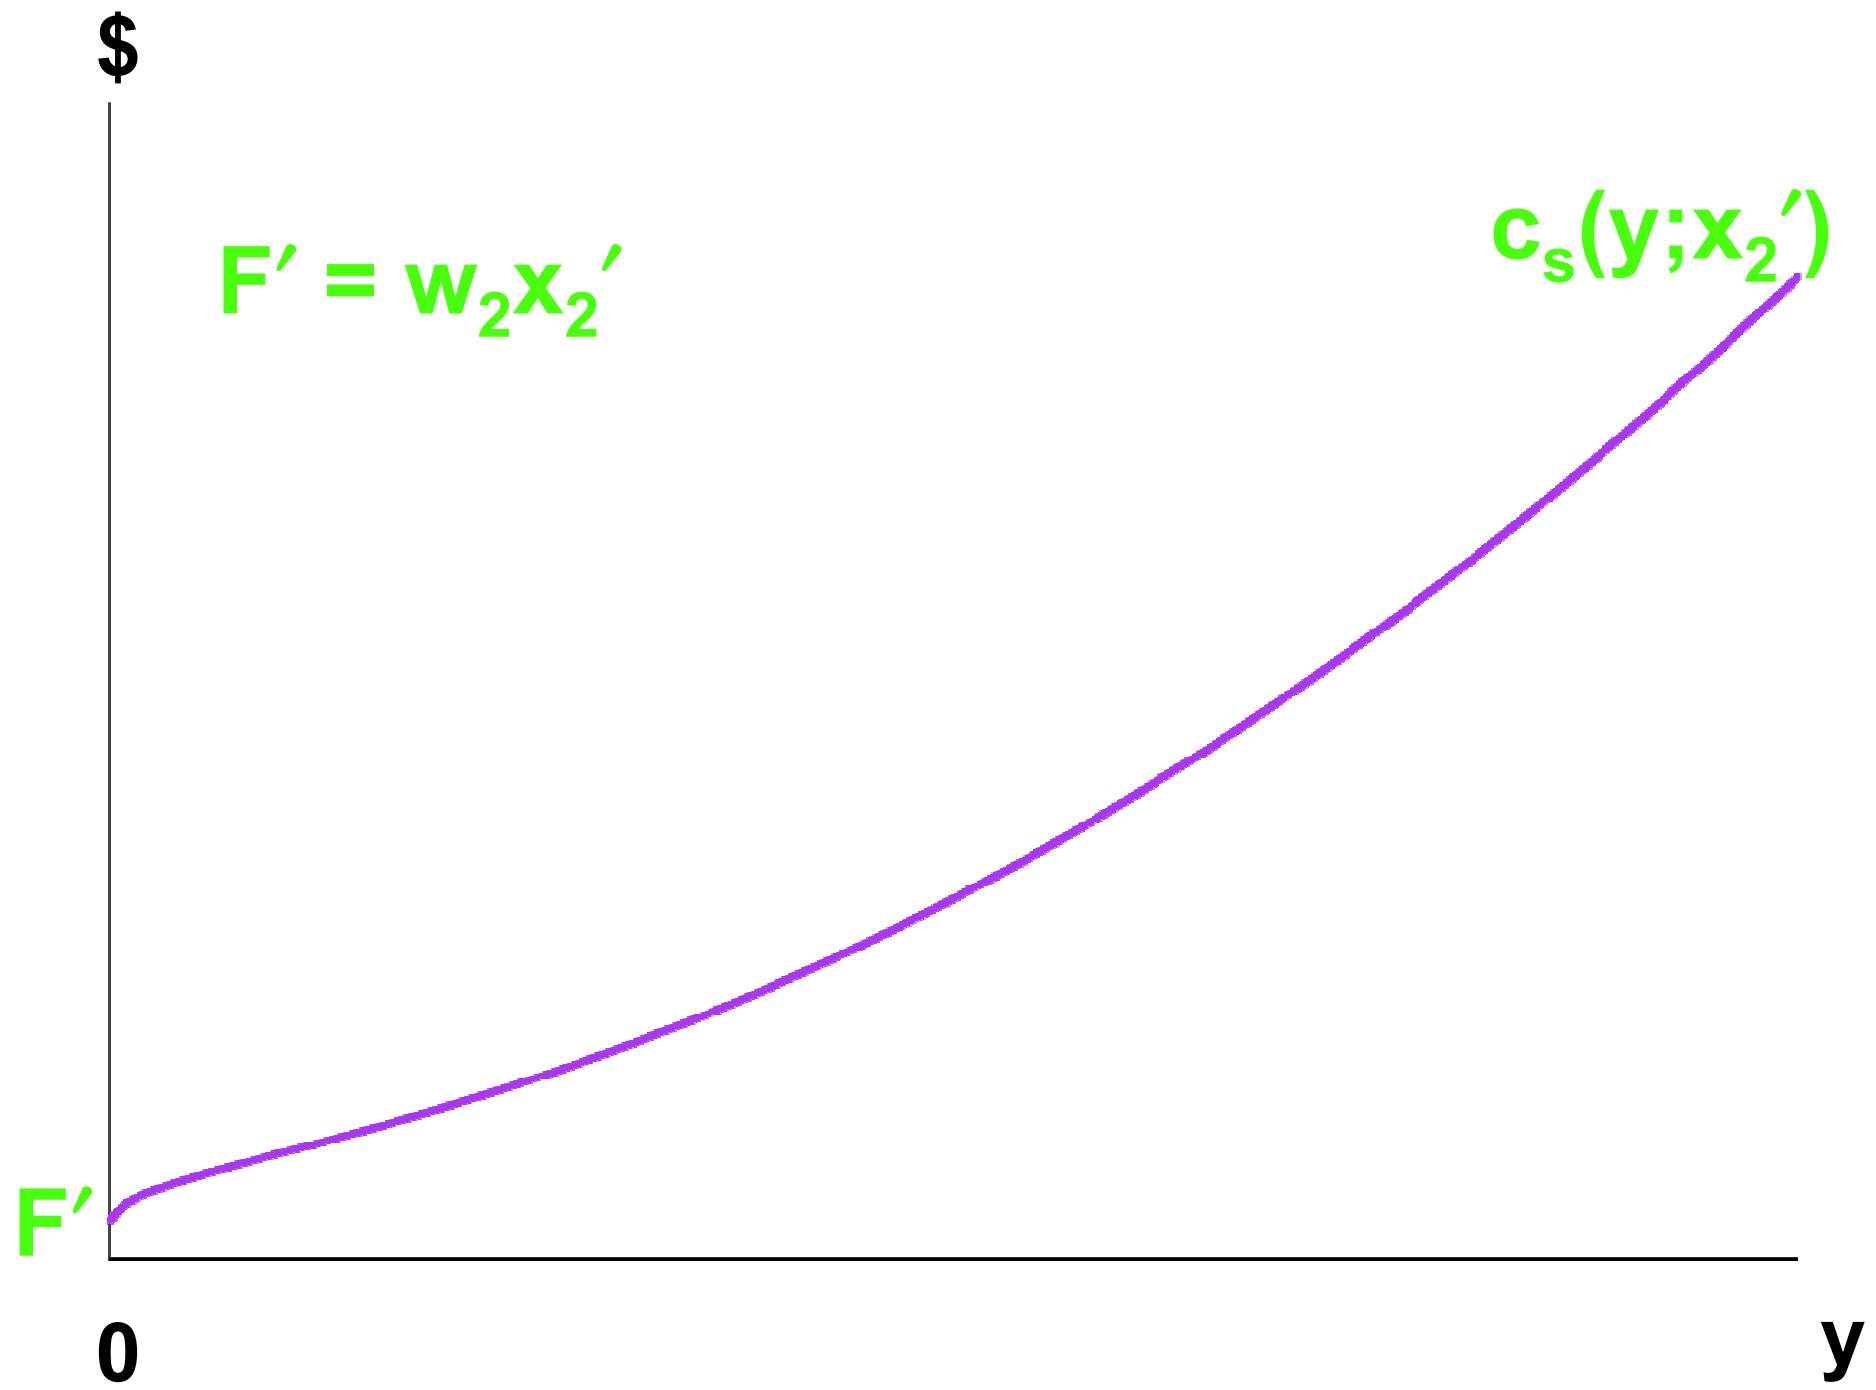

or

$$x_2 = x_2''$$

or

$$x_2 = x_2'''$$

$$x_2' < x_2'' < x_2'''$$

\$

$$F' = w_2 x_2'$$
$$F'' = w_2 x_2''$$

A larger amount of the fixed input increases the firm's fixed cost.

$c_s(y; x_2')$

$c_s(y; x_2'')$

Why does a larger amount of the fixed input reduce the slope of the firm's total cost curve?

F''

F'

0

y

Short-Run & Long-Run Total Cost Curves

MP_1 is the marginal physical productivity of the variable input 1, so one extra unit of input 1 gives MP_1 extra output units. Therefore, the extra amount of input 1 needed for 1 extra output unit is

Short-Run & Long-Run Total Cost Curves

MP_1 is the marginal physical productivity of the variable input 1, so one extra unit of input 1 gives MP_1 extra output units. Therefore, the extra amount of input 1 needed for 1 extra output unit is $1/MP_1$ units of input 1.

Short-Run & Long-Run Total Cost Curves

MP_1 is the marginal physical productivity of the variable input 1, so one extra unit of input 1 gives MP_1 extra output units.

Therefore, the extra amount of input 1 needed for 1 extra output unit is

$1/MP_1$ units of input 1.

Each unit of input 1 costs w_1 , so the firm's extra cost from producing one extra unit of output is

Short-Run & Long-Run Total Cost Curves

MP₁ is the marginal physical productivity of the variable input 1, so one extra unit of input 1 gives MP₁ extra output units.

Therefore, the extra amount of input 1 needed for 1 extra output unit is 1/MP₁ units of input 1.

Each unit of input 1 costs w₁, so the firm's extra cost from producing one extra unit of output is

$$\text{MC} = \frac{w_1}{\text{MP}_1}.$$

Short-Run & Long-Run Total Cost Curves

$MC = \frac{w_1}{MP_1}$ is the slope of the firm's total cost curve.

Short-Run & Long-Run Total Cost Curves

$MC = \frac{w_1}{MP_1}$ is the slope of the firm's total cost curve.

If input 2 is a complement to input 1 then MP_1 is higher for higher x_2 .

Hence, MC is lower for higher x_2 .

That is, a short-run total cost curve starts higher and has a lower slope if x_2 is larger.

Short-Run & Long-Run Total Cost Curves

- ◆ **The firm has three short-run total cost curves.**
- ◆ **In the long-run the firm is free to choose amongst these three since it is free to select x_2 equal to any of x_2' , x_2'' , or x_2''' .**
- ◆ **How does the firm make this choice?**

\$

For $0 \leq y \leq y'$, choose $x_2 = ?$

$c_s(y; x_2')$

$c_s(y; x_2'')$

$c_s(y; x_2''')$

\$

For $0 \leq y \leq y'$, choose $x_2 = x_2'$. $c_s(y; x_2')$

\$

For $0 \leq y \leq y'$, choose $x_2 = x_2'$. $c_s(y; x_2')$

For $y' \leq y \leq y''$, choose $x_2 = ?$

\$

For $0 \leq y \leq y'$, choose $x_2 = x_2'$. $c_s(y; x_2')$

For $y' \leq y \leq y''$, choose $x_2 = x_2''$.

\$

For $0 \leq y \leq y'$, choose $x_2 = x_2'$. $c_s(y; x_2')$

For $y' \leq y \leq y''$, choose $x_2 = x_2''$.

For $y'' < y$, choose $x_2 = ?$

\$

For $0 \leq y \leq y'$, choose $x_2 = x_2'$. $c_s(y; x_2')$

For $y' \leq y \leq y''$, choose $x_2 = x_2''$.

For $y'' < y$, choose $x_2 = x_2'''$.

\$

For $0 \leq y \leq y'$, choose $x_2 = x_2'$. $c_s(y; x_2')$

For $y' \leq y \leq y''$, choose $x_2 = x_2''$.

For $y'' < y$, choose $x_2 = x_2'''$.

Short-Run & Long-Run Total Cost Curves

- ◆ **The firm's long-run total cost curve consists of the lowest parts of the short-run total cost curves. The long-run total cost curve is the **lower envelope** of the short-run total cost curves.**

Short-Run & Long-Run Total Cost Curves

- ◆ **If input 2 is available in continuous amounts then there is an infinity of short-run total cost curves but the long-run total cost curve is still the lower envelope of all of the short-run total cost curves.**

Short-Run & Long-Run Average Total Cost Curves

- ◆ **For any output level y , the long-run total cost curve always gives the lowest possible total production cost.**
- ◆ **Therefore, the long-run av. total cost curve must always give the lowest possible av. total production cost.**
- ◆ **The long-run av. total cost curve must be the lower envelope of all of the firm's short-run av. total cost curves.**

Short-Run & Long-Run Average Total Cost Curves

- ◆ E.g. suppose again that the firm can be in one of just three short-runs;

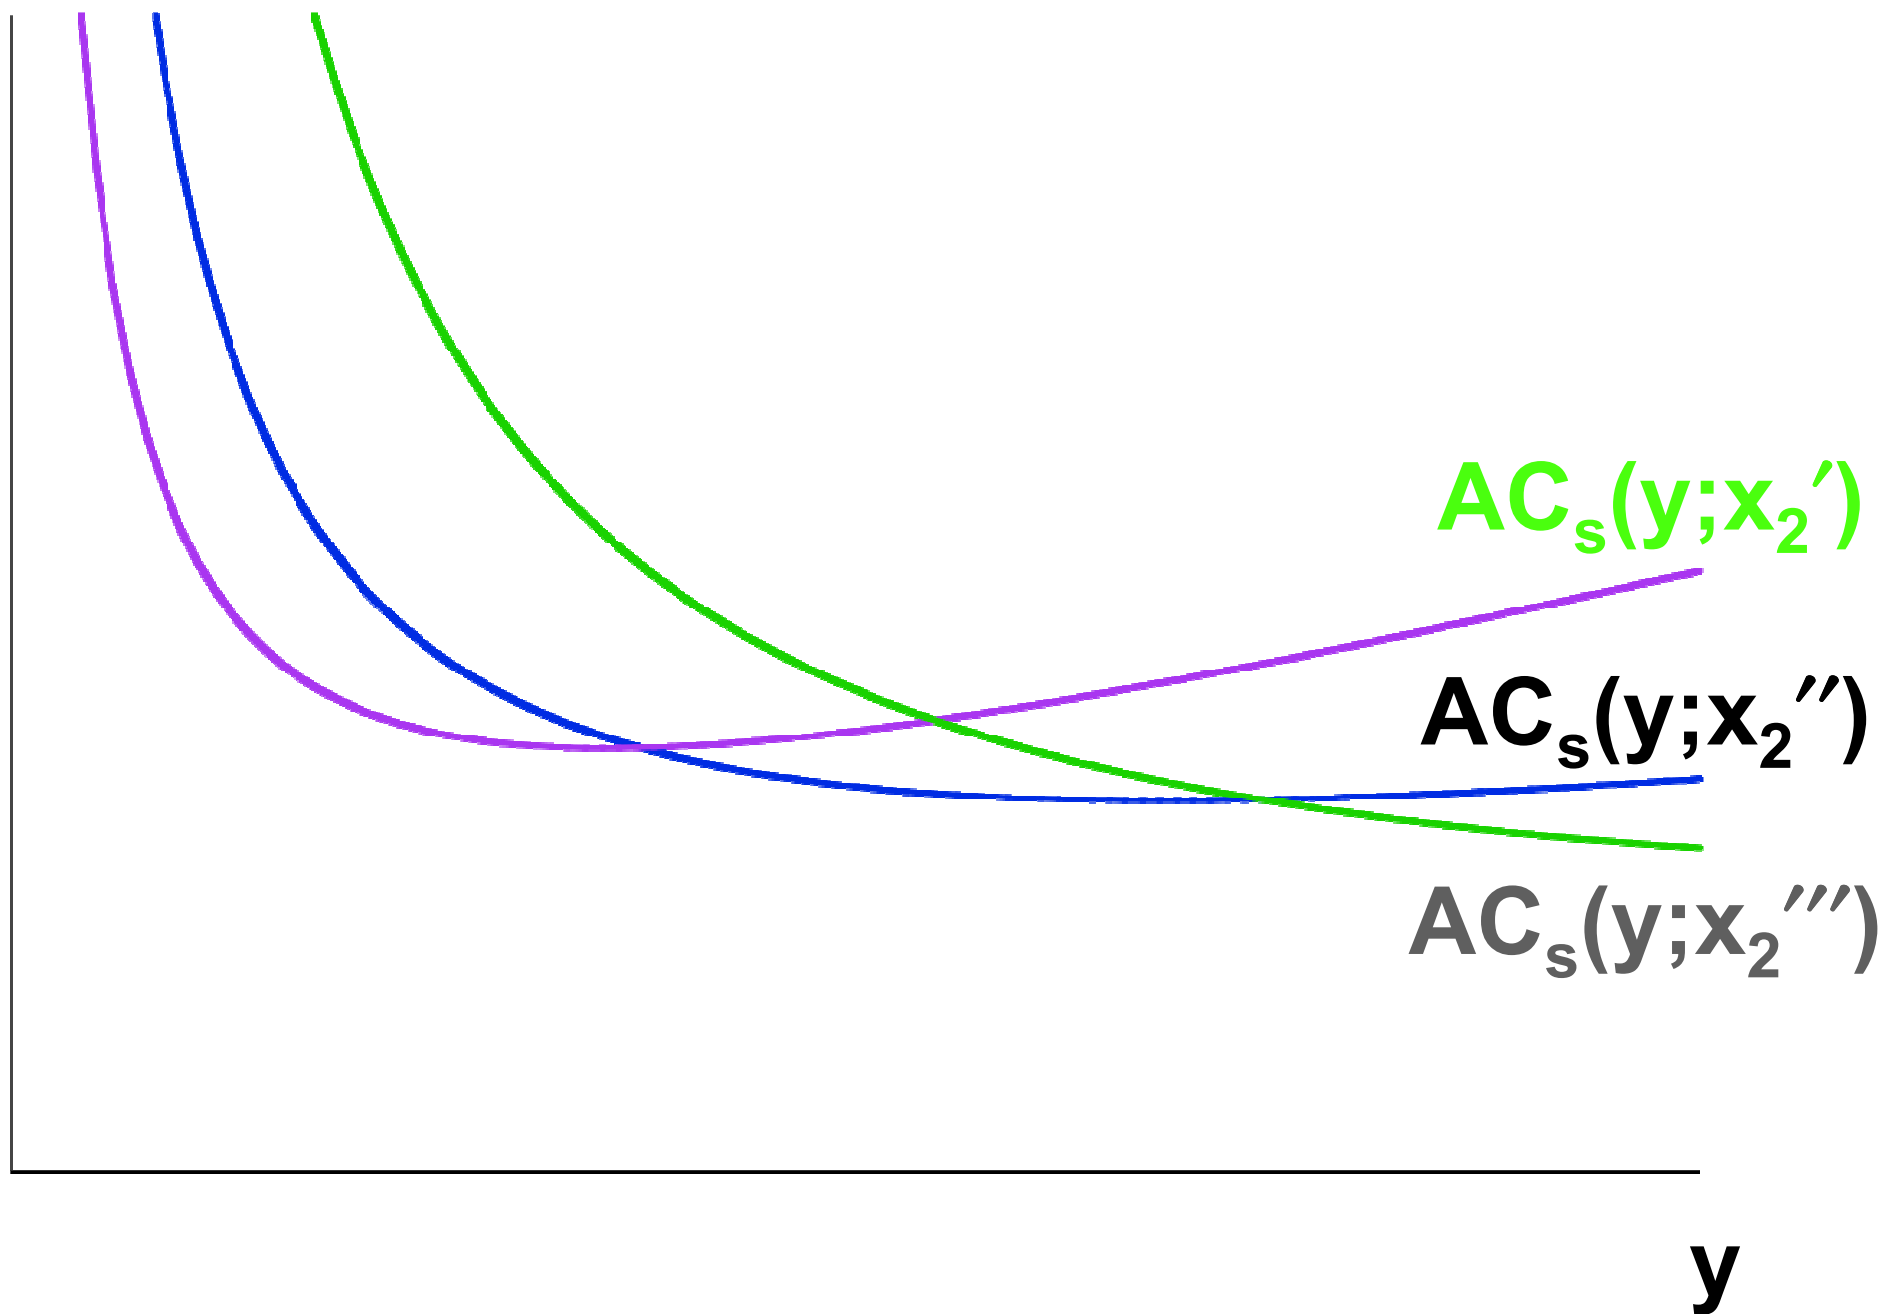

$$x_2 = x_2'$$

or $x_2 = x_2''$ ($x_2' < x_2'' < x_2'''$)

or $x_2 = x_2'''$

then the firm's three short-run average total cost curves are ...

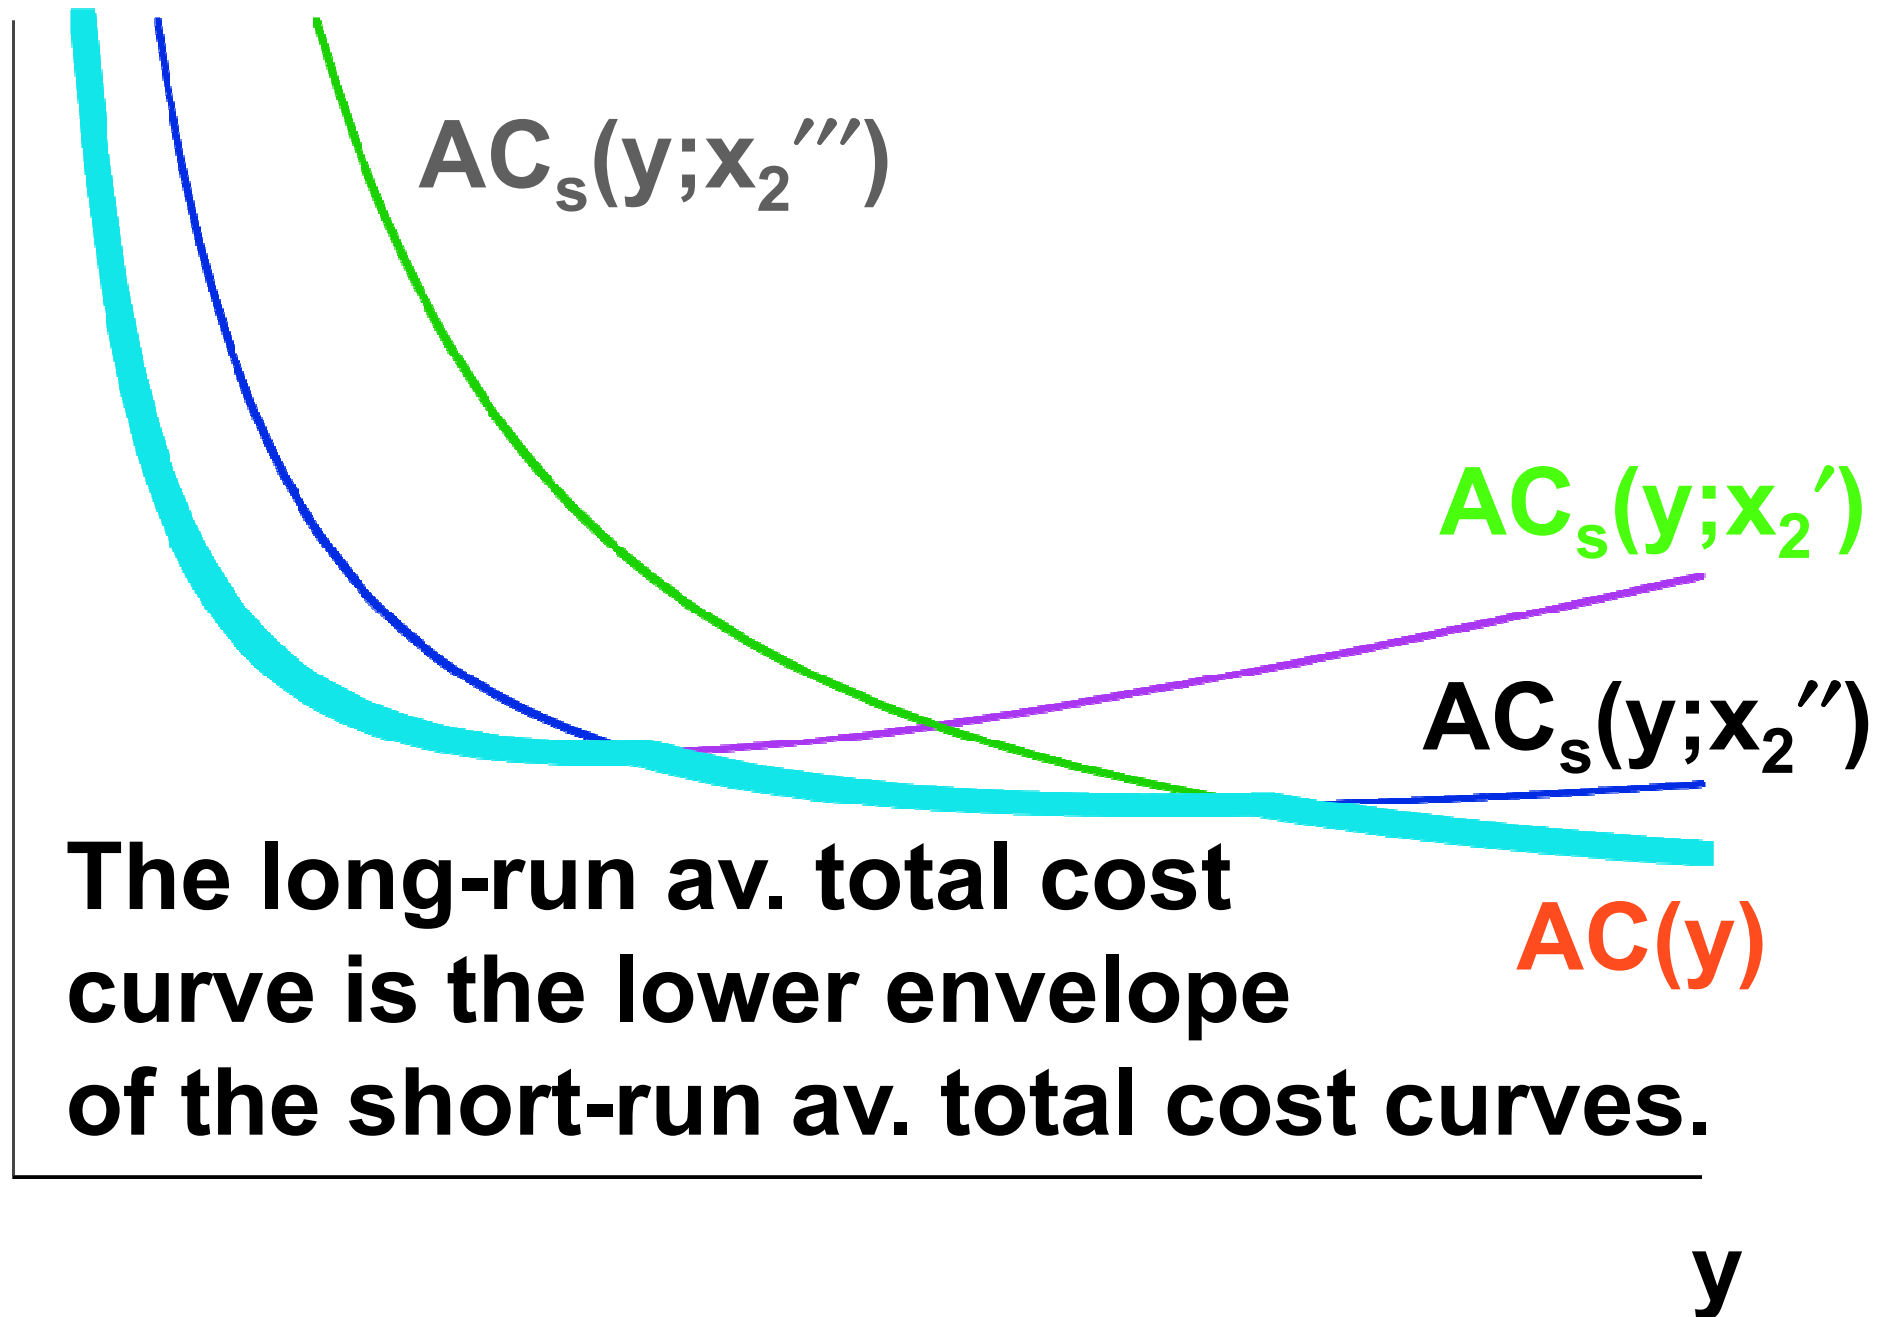

\$/output unit

Short-Run & Long-Run Average Total Cost Curves

- ◆ **The firm's long-run average total cost curve is the lower envelope of the short-run average total cost curves ...**

\$/output unit

The long-run av. total cost curve is the lower envelope of the short-run av. total cost curves.

Short-Run & Long-Run Marginal Cost Curves

- ◆ **Q: Is the long-run marginal cost curve the lower envelope of the firm's short-run marginal cost curves?**

Short-Run & Long-Run Marginal Cost Curves

- ◆ **Q: Is the long-run marginal cost curve the lower envelope of the firm's short-run marginal cost curves?**
- ◆ **A: No.**

Short-Run & Long-Run Marginal Cost Curves

- ◆ **The firm's three short-run average total cost curves are ...**

\$/output unit

\$/output unit

$MC_s(y; x_2')$

$MC_s(y; x_2'')$

$AC_s(y; x_2''')$

$AC_s(y; x_2')$

$AC_s(y; x_2'')$

$MC_s(y; x_2''')$

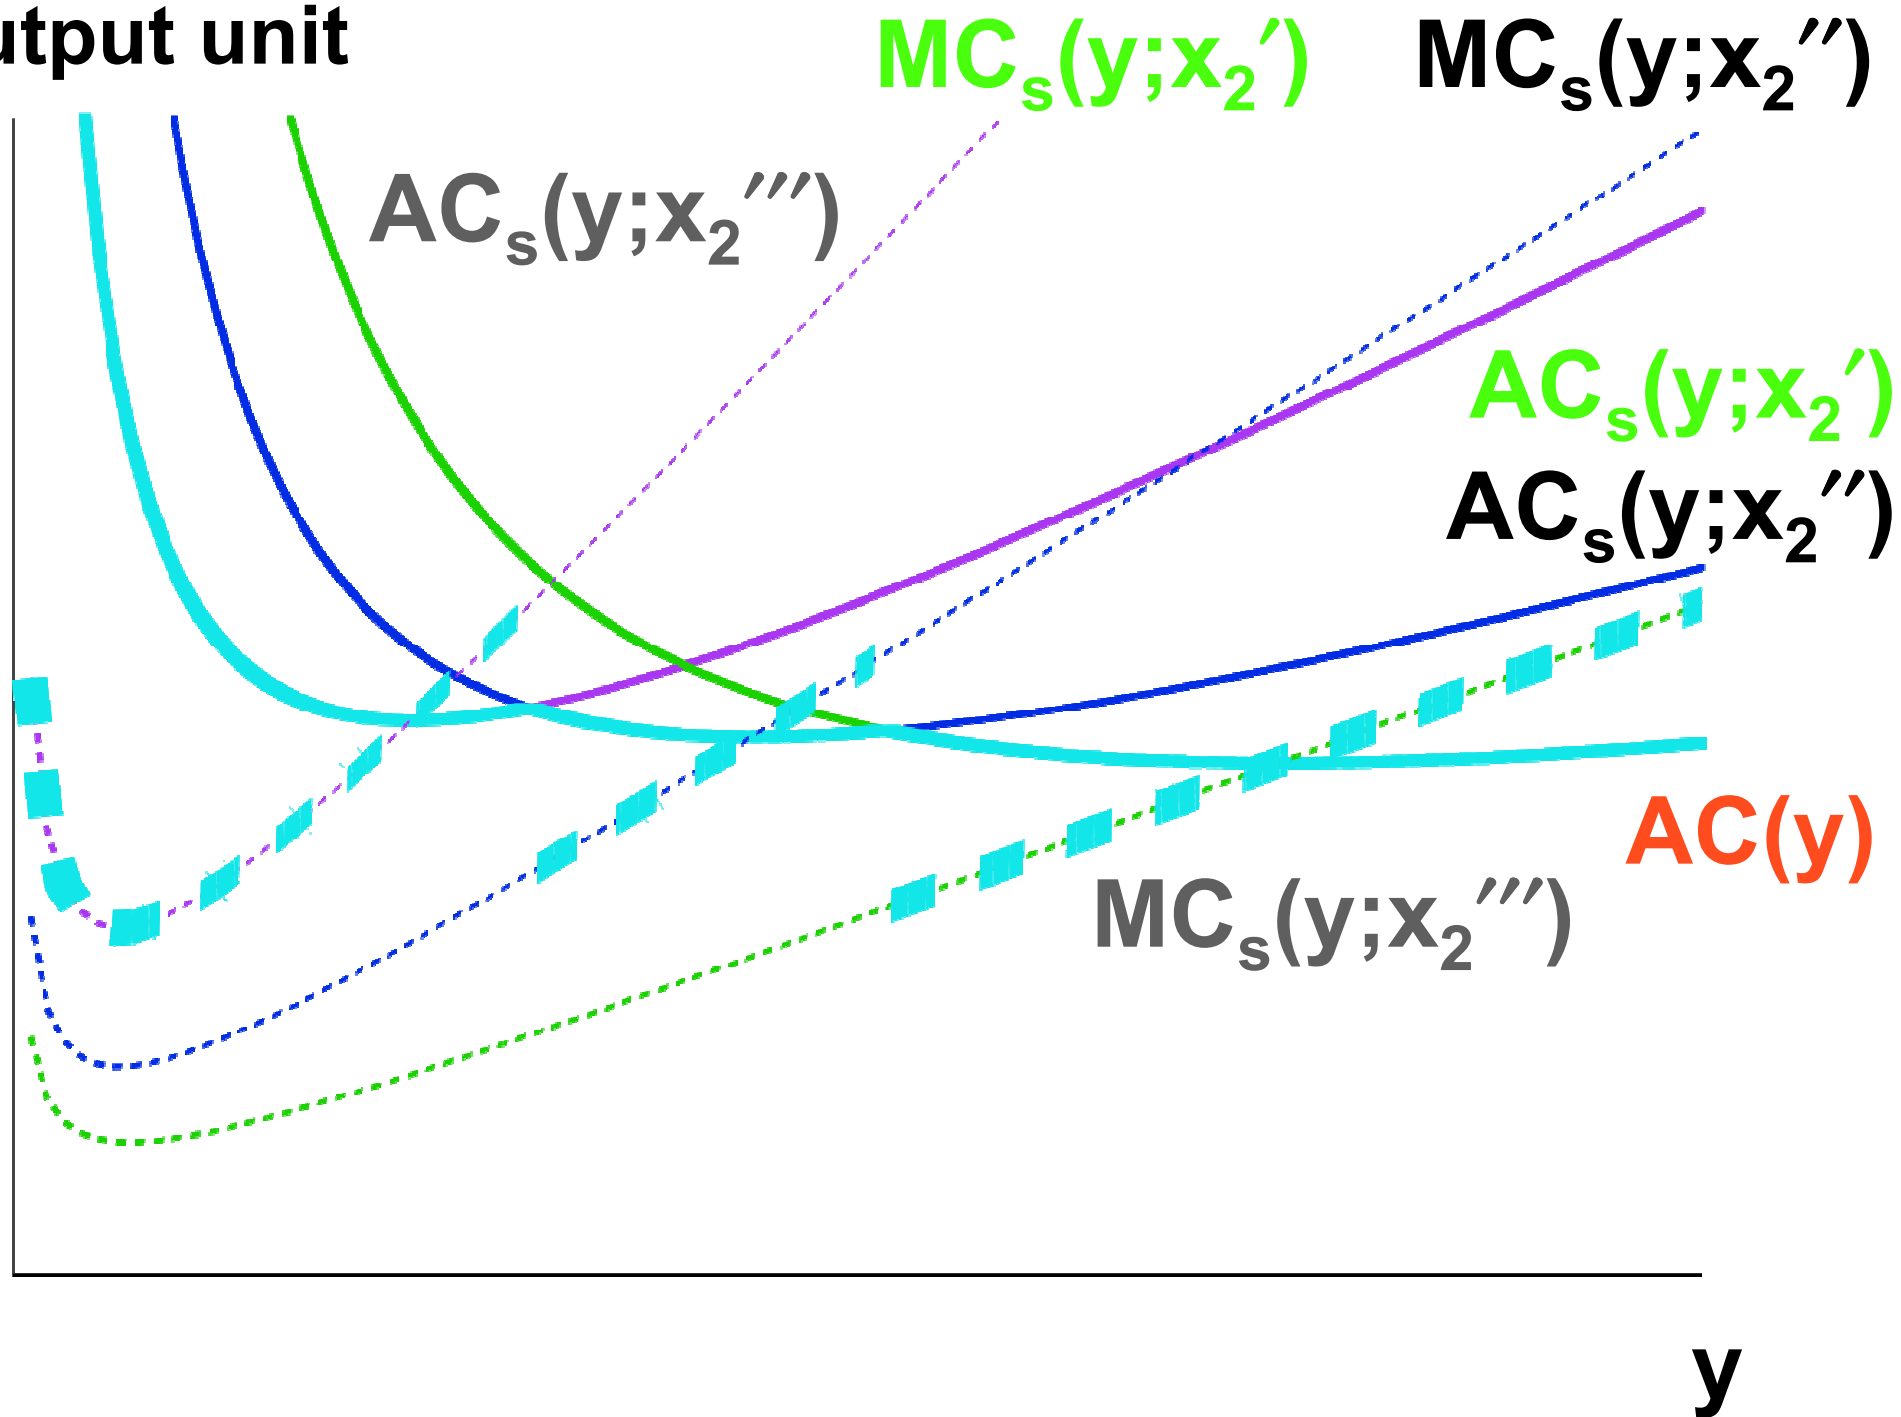

y

\$/output unit

\$/output unit
