Designing and Managing Service Processes

Dysfunctional customer behavior

In some services customers share common facilities and their behaviour affect the outcome of the service experience

negatively x positively

two strategies
- 'The customer is king and can do no wrong'
- there are some nasty people who cannot be trusted to behave in ways that self-respecting service providers should expect and require

we can encounter: thief, rulebreaker, aggressor, vandal, deadbeat, ...

- design processes that minimizes risk of failure
- do prevention
- in case of manager involvement - facilitator, supporter

The customer as co-producer

levels of customer participation
- low
- moderate
- high

self-service technologies

customers as partial employees

Service process redesign

Blueprinting of services

developing a Blueprint

Identify all key activities involved in creating and delivering the service and specify the linkages between them

why blueprint is helpful

key components
1. definition of standards of each front-stage activity
2. physical and other evidence for front-stage activities
3. principal customer actions illustrated by pictures
4. line of interaction
5. front-stage actions by customer-contact personnel
6. line of visibility
7. backstage actions by customer-contact personnel
8. support processes involving other service personnel
9. support processes involving information technology

from left to right, it provides sequence of actions over time

setting standards

Designing and Managing Service Processes

processes are the
architecture of services

they describe the method and sequence in which
service operating systems work, specifying how
they link together to create the value proposition
that has been promised to customers

badly designed processes are likely to annoy
customers

Blueprinting of services

it is a tool used to design new service or redesign existing ones

it is more sophisticated version of flowcharting (describes existing process often in a simple form)

it specifies in some detail how a service process should be constructed

it describes processes involving flows, sequences, relationships, and dependencies

developing a Blueprint

no required way how to prepare it

identify all key activities involved in creating and delivering the service and then define linkages between them

distinquish between what customers experience 'front stage' and what are activities of employees and support processes 'backstage' → separated by line of visibility

why blueprint is helpful

it clarifies interactions between customers and employees, and how these are supported by backstage activities and systems

blueprint is a way to identify potential fail points in the process

managers aware of them can

- take preventive measures
- prepare contingency plans

blueprint can pinpoint stages at which customers commonly have to wait

BRAIN LOADING...
Please wait.

based on this information following can be developed

- standards for execution of each activity
- times for completion of a task
- maximum wait between tasks
- scripts to guide interactions between staff and customer

key components

1. definition of standards of each front-stage activity
2. physical and other evidence for front-stage activities
3. principal customer actions (illustrated by pictures)
4. line of interaction
5. front-stage actions by customer- contact personnel
6. line of visibility
7. backstage actions by cusomer-contact personnel
8. support processes involving other service personnel
9. support processes involving information technology

from left to right, it prescribes sequence of actions over time
setting standards

customers' expectations range across a zone of tolerance

standards should be sufficiently high to satisfy and even delight customers

eliminate the risk of errors - use fail-safe methods (for customers as well as for employees)

- opening scenes are important - it effect later perception
- perceptions of experiences tend to cumulate
- importance of a strong finish (even if it start poorly) - the service is better rated than the one with strong opening and poor finish
- in low contact services every contact is viewed very seriously

of

In Amsterdam, the tile under Schiphol's urinals would pass inspection in an operating room. But nobody notices. What everybody does notice is that each urinal has a fly in it.

Look harder, and the fly turns into the black outline of a fly, etched into the porcelain. It improves the aim. If a man sees a fly, he aims at it. Fly-in-urinal research found that etchings reduce spillage by 80%. It gives a guy something to think about. That's the perfect example of process control.

ers' expectations ran

a zone of tolerance

from desired service (an ideal) to a
threshold level of merely adequate service

ds should be

- opening scenes are important - it effect later perception
- perceptions of experiences tend to cumulate
- importance of a strong finish (even if it start poorly) - the service is better rated than the one with strong opening and poor finish
- in low contact services every contact is viewed very seriously

as

standards should be sufficiently high to satisfy and even delight customers

eliminate the risk of errors - use fail-safe methods (for customers as well as for employees)

Service process redesign

revitalize processes that have become outdated

two reasons for outdatet processes

"Nobody uses crystal balls anymore!"

changes in external environment
- which made the existing practices obsolete and requires redesign (or new processes) for the organization to remain relevant and responsive

changes in internal environment
- reflects a natural decline of quality of processes, creeping bureaucracy or evolution of unofficial standards
- leads to data redundancy, extensive information exchange, high ratio of control activities, ..

redesign focus on achieving changes in key performances

ideally to achieve them simultaneously

1. to reduce number of service failures
2. to reduce cycle time from customer initiation of a service process to its completion
3. to enhance productivity
4. to increase suctomer satisfaction

redesign encompasses reconstitution, rearrangement, or substitution of processes, such as
- elimination non-value-adding steps
- shifting to self-service
- bundling services
- redesing physical aspects
- ...

consider (or reconsider) who should be responsible for delivery of each of component

3. to enhance productivity
4. to increase suctomer satisfaction

The customer as co-producer

levels of customer participation

- low — requires the physical presence of customer only
- moderate — include provision of information, personal effort,
- high — cannot be created apart from the active participation of customer -> if not, the quality of service outcome is jeopardized

self-service technologies

loved and hated at the same time

- accessible 24/7
- enabling to get detailed information
- faster

- they can fail
- difficult to understand
- usually no service recovery system (which means e.g. we have to call somewhere)

customers as partial employees

this perspective requires a change in management mindset

NOTE that customers who are offered an opportunity to participate at an active level are more likely to be satisfied -> because they like to be offered a choice

1/3 of all service problems are caused by customers

focus on preventing their failures by collection data on problem occurences, analyze them and establish preventive solutions

EPIC FAILURE

The customer as co-producer

levels of customer participation
