

Reverse code engineering

Powerfull knowledge, lot of fun and legal for several purposes!

Basic information available in Wikipedia article on reverse engineering (IS copy REWiki.pdf)

- RE in general, example with B-29, synthetic chemistry/biology
- Legality
 - Own binary without documentation
 - Interoperability
 - Anti-virus research
 - Fair use, education
 - Problem with recent copyright laws (attempt to circumvent is illegal, not only selling circumvented content)
 - Forensics
- Disassembler vs. debugger
 - Static vs. dynamic code analysis
 - Debugger vs. Debugger with advanced modification tools (Visual Studio vs. OllyDbg)
- Assembler vs. bytecode
 - Instruction set (downloadable)
 - Register-based vs. stack-based execution
- Structured code vs. sequence of executed instructions
 - Structured code contains code for all branches (runable binary)
 - Sequence of executed instructions only from branches taken (power analysis of smart card)
- Example: Java Card bytecode
 - sspush, sspush, add, ifeq
- Example: Win32 binary
 - Lena tutorials 1 and 2
 - Name of the registers (EAX 32bit, AX 16bit, AH/AL 8bit)
 - Flags (Zero/Sign/Carry)

Java(Card) bytecode

Intermediate code interpreted by virtual machine (see JavaCard222_ops.pdf).

- Usually easier to understand than assembler code.
- Stack-based oriented execution, no registers are used (all operands at the top of the stack).
- Operation takes its operands from stack and return result there.
- JavaCard example selected because of lower number of opcodes.
- Same principle works for Java, .NET CLI ...

```
// ENCRYPT INCOMING BUFFER
void Encrypt(APDU apdu) {
    byte[]    apdubuf = apdu.getBuffer();
    short     dataLen = apdu.setIncomingAndReceive();
    short     i;

    // CHECK EXPECTED LENGTH (MULTIPLY OF 64 bites)
    if ((dataLen % 8) != 0)
        ISOException.throwIt(SW_CIPHER_DATA_LENGTH_BAD);

    // ENCRYPT INCOMING BUFFER
    m_encryptCipher.doFinal(apdubuf, ISO7816.OFFSET_CDATA, dataLen,
                            m_ramArray, (short) 0);

    // COPY ENCRYPTED DATA INTO OUTGOING BUFFER
    Util.arrayCopyNonAtomic(m_ramArray, (short) 0, apdubuf,
                            ISO7816.OFFSET_CDATA, dataLen);

    // SEND OUTGOING BUFFER
    apdu.setOutgoingAndSend(ISO7816.OFFSET_CDATA, dataLen);
}
```

Original JavaCard source code

```
.method Encrypt(Ljavacard/framework/APDU;)V 129 {
    .stack 6;
    .locals 3;
    .descriptor    Ljavacard/framework/APDU;    0.10;
        L0:    aload_1;
                invokevirtual 30;
                astore_2;
                aload_1;
                invokevirtual 42;
                sstore_3;
                sload_3;
                bspush 8;
                srem;
                ifeq L2;
        L1:    sspush 26384;
                invokestatic 41;
                goto L2;
        L2:    getfield_a_this 1;
                aload_2;
                sconst_5;
                sload_3;
                getfield_a_this 10;
                sconst_0;
                invokevirtual 43;
```

```

        pop;
        getfield_a_this 10;
        sconst_0;
        aload_2;
        sconst_5;
        aload_3;
        invokestatic 44;
        pop;
        aload_1;
        sconst_5;
        aload_3;
        invokevirtual 45;
        return;
    }

```

Resulting JavaCard bytecode

Native binary code (assembler)

How to start quickly with assembler (mixed mode)

Most current IDE supports mixed source code/assembler instructions mode (Visual Studio, QT Creator...). Mode is usually available during a debugging.

1. Write simple code (e.g., if then else condition), insert breakpoint and start debugging
2. Switch to mixed mode
 - a. Visual Studio→RClick →Go to disassembly
 - b. QTcreator→Debug→Operate by Instruction
3. Learn how particular source code is translated into assembler code

```

#include <stdio.h>
int main() {
    FILE* file = NULL;
    file = fopen("values.txt", "r");

    if (file) {
        int value1 = 0;
        int value2 = 0;
        fscanf(file, "%d", &value1);
        fscanf(file, "%d", &value2);

        value1 = value1 + value2;

        printf("Result: %d", value1);
    }
    fclose(file);
}

```

Relevant snapshot from executable binary

value = value + value2;

1. Načtení hodnot z HDD do RAM paměti
 - `fscanf("%d", &value);`
2. Přesun hodnot z RAM paměti do registru CPU
 - `MOV 0x48(%esp),%eax`
3. Provedení instrukce procesoru (např. ADD)
 - `ADD %edx,%eax`
4. Uložení výsledku registru CPU do RAM
 - `MOV %eax, 0x48(%esp)`
5. Vypsání na standardní výstup
 - `printf("%d", value);`

```
Dump of assembler code for function main:
2      int main() {

0x004013f6 <+178>:    ret

End of assembler dump.
```

Display of mixed mode of source code and resulting assembler instructions

Disassembling binary code (OllyDbg)

In case when only binary code is available (no source code), other approach is required. We will work with OllyDbg (www.ollydbg.de) program that is easy-to-use disassembler and debugger.

- Download OllyDbg 1.10 (freeware) either from <http://www.ollydbg.de/> or (better) from IS (OllyDbg.zip).
- Download tutorials I and II. by Lena from IS (tut1.rar and tut2.rar). Additional tutorials can be obtained from <http://www.tuts4you.com>.
- Download Assembler basics from IS (BasicsOfAssembler.pdf)

Disassembled information provided by OllyDbg

OllyDbg shortcuts & most important commands

F3 ... Open binary file

F2 ... Toggle breakpoint (on opcodes, or double click)

F9 ... Run debugged program

Ctrl+F2 ... Restart program, all temporary changes are lost!

F8 ... Step over

F7 ... Step into

Spacebar or double click ... allows to set new opcode. Use when you like to change program behaviour, e.g., replacing conditional jump (JGE) by unconditional jump (JMP) or to discard instruction (NOP).

Alt+BkSp ... Undo change

Rightclick->Search for->All referenced text strings ... Constant text strings referenced in code. Use to find strings like hardcoded passwords, important messages ("Wrong license"). Double click on string will takes you to referencing instruction. Helps you to build mind model quickly.

Rightclick->Find references to->Address constant ... will find references to particular memory elsewhere in the code – use when you like to know where in code the memory is set, changed or otherwise used.

Ctrl+F1 ... Help on Win32 API (WIN32 API help file already prepared in OllyDbg directory (WIN32.HLP)). Use to get meaning of the parameters pushed to stack just before the API function is called.

; ... add or edit your comment for specific code line. Use to write down things you already understand. Use classic paper as well (program mind model)

Rightclick->Copy to executable->All modifications (or Selection) ... make changes permanent. New window with modified code is opened. **Rightclick->Save file** to write patched binary to disk.

Registers (FPU):

Z – zero flag, C – carry flag, S – sign flag. Invert bit flag by double click.

EIP ... next address to execute (instruction pointer)

EBX ... usually loop counter

Some hints

- Assembler is not as difficult as it may seem at first sight. You are not required to write your own program in assembler – you are usually only required to understand existing code, where only very limited set of assembler operations is used.
- Using mixed mode in IDE debugger will quickly provide you an insight, how common programming constructions (assignments, conditional branching, cycles...) are transformed from source code into editor. Usually, you will get only 5-15 instructions per line of the source code, with MOV instruction being the most common.
- Conditional branching is usually realized by two consecutive operations:
 - Comparison operation setting Flags register
 - Conditional jumping operation to address based on Flags (Branch 1)
 - If not jumped then Branch 2 code is directly present on the next instruction, or unconditional jump JMP to Branch 2 is present.
- Comparison operation
 - CMP EAX, -1 - will set flag(s) in Registers, Zero and Sign flags are usually of interest. If two values are same (EAX == -1), Zero flag is set to 1.
 - TEST A, B (usually TEST EAX, EAX) – logical AND operation, results not saved, Flags are set. TEST EAX, EAX will test if value in EAX is equal to 0. If EAX == 0 then Zero flag == 1, 0 otherwise.
- Jump operation
 - Unconditional JMP – jump every time
 - Conditional - based on the current value of flag(s)

| | | |
|-------|-----------------------------------|-----------------------------------|
| JA* | Jump if (unsigned) above | - CF=0 and ZF=0 |
| JB* | Jump if (unsigned) below | - CF=1 |
| JE** | Jump if equal | - ZF=1 |
| JG* | Jump if (signed) greater | - ZF=0 and SF=OF (SF = Sign Flag) |
| JGE* | Jump if (signed) greater or equal | - SF=OF |
| JL* | Jump if (signed) less | - SF != OF (!= is not) |
| JLE* | Jump if (signed) less or equal | - ZF=1 and OF != OF |
| JMP** | Jump | - Jumps always |
| JNE** | Jump if not equal | - ZF=0 |

Disassembling binary code (IDAPro freeware)

Interactive Disassembler is legendary fullfledged disassembler with ability to disassemble many different platforms.

- Free version available for non-commercial uses
- <http://www.hex-rays.com/idapro/idadownfreeware.htm>
- Free version disassemble only Windows binaries
- Very nice visualization and debugger feature (similar as OllyDbg)
- Try it!

Decompiling binary code

Decompiler is able to produce source code from binary code. Decompiler needs to do disassembling first and then try to create code that will in turn produce binary code you have at the beginning.

- Resulting code will NOT contain information removed during compilation (comments, function names, formatting...)
- Read <http://www.debugmode.com/dcompile/> for more info
- Still can be of great help!
- Problem to find well working free disassembler :(
- http://en.wikibooks.org/wiki/X86_Disassembly/Disassemblers_and_Decompile

Homework

The goal of this assignment is to reverse engineer supplied crack me file (LabakCrackMe.exe), obtain information about its behavior and make program to continue successfully without error message by a) patching, b) creating valid license info. More principally different solutions for the same problem will be awarded by extra points.

Hints:

- You may use OllyDbg or any other disassembler.
- Function *fread* fail by null exception if invalid file handle is supplied.

Submit:

- Short description of program behavior in text form or as **annotated** C source code (not only output of some disassembler) (source code version will be awarded by 1 extra point).
- Patched crack me binary that let the program run every time successfully with no error **without** valid license info.
- Valid license info that let program run successfully **without binary modification**.
