

300-word

Zack Kanter is presenting his view on the future of self-driven cars. Using the information Tesla Motor, Bloomberg News or Google, he assumes that autonomous cars will be commonly seen in the streets in 2025 and they will almost have the monopoly in 2030. Using this presumptions as a starting point, he shows the reader how the world will look like and how this change will affect our daily lives.

Most of the people in United States are looking forward to using these cars and they are not planning to get back to normal driving, once they can use autonomous cars.

But the main thing that will change is the type of ownership of cars. These will no longer be possessed by individuals or small companies. The author assumes that almost every car will be owned by a car-sharing company which will allow its clients to use their cars in seconds from the request.

This means that the number of cars in the streets will strongly decrease up to 1%. This will lead to cleaner air (the elimination of 99% cars will reduce the air pollution by almost 16%), less injuries (autonomous cars are very safe) and more space in the cities as no parking lanes will be necessary. As you get out of the car, it leaves and searches for a new passenger.

This innovation will lead to a strong change in employment structure. The author supposes that the major automakers will go bankrupt and around 10 million of people will lose their jobs. The employment will have to be reorganized. He also believes that these people will get new opportunities, as the new innovations will be possible with money saved on car ownership.

100-word

Zack Kanter is presenting his idea on the future of autonomous cars. He supposes that they will be normally seen by 2025 and will strongly change our lives. We will no longer own cars, car-sharing companies will borrow them to their customers. The total amount of cars will shrink to only 1% which will lead to cleaner air and much more space in cities. The author is very optimistic about people who will lose their jobs in major automotive companies. He hopes they will find new ones in new industries which will prosper using money saved by not buying cars.

3-sentence

Zack Kanter visualizes a very bright future of autonomous cars. He hopes they will help to decrease the total number of cars, help to your environment and save a lot of time to all people. He also presumes a great economic change, as bankrupting of major car companies is expected.
