Cryptography and Security

Check-in activity: how to stay awake

- Any idea what we can do, prepare, try... to help us stay awake?
- (5 minutes)

Overview

1. What smart cards are?
2. What smart cards are capable of?
3. How to manage smart cards?
4. Lightweight secure channel protocols
5. Two-factor authentication and some attacks

Smart card basics

What A Smart card is?

Basic types of (smart) cards

1. Contactless “barcode”
 - Fixed identification string (RFID, < 5 cents)
2. Simple memory cards (magnetic stripe, RFID)
 - Small write memory (< 1KB) for data, (~10 cents)
3. Memory cards with PIN protection
 - Memory (< 5KB), simple protection logic (<\$1)

Basic types of (smart) cards (2)

4. Cryptographic smart cards
 - Support for (real) cryptographic algorithms
 - Mifare Classic (\$1), Mifare DESFire (\$3)
6. User-programmable cryptographic smart cards
 - JavaCard, .NET card, MULTOS cards (\$2-\$30)
- Chip manufacturers: NXP, Infineon, Gemalto, G&D, Oberthur, STM, Atmel, Samsung...

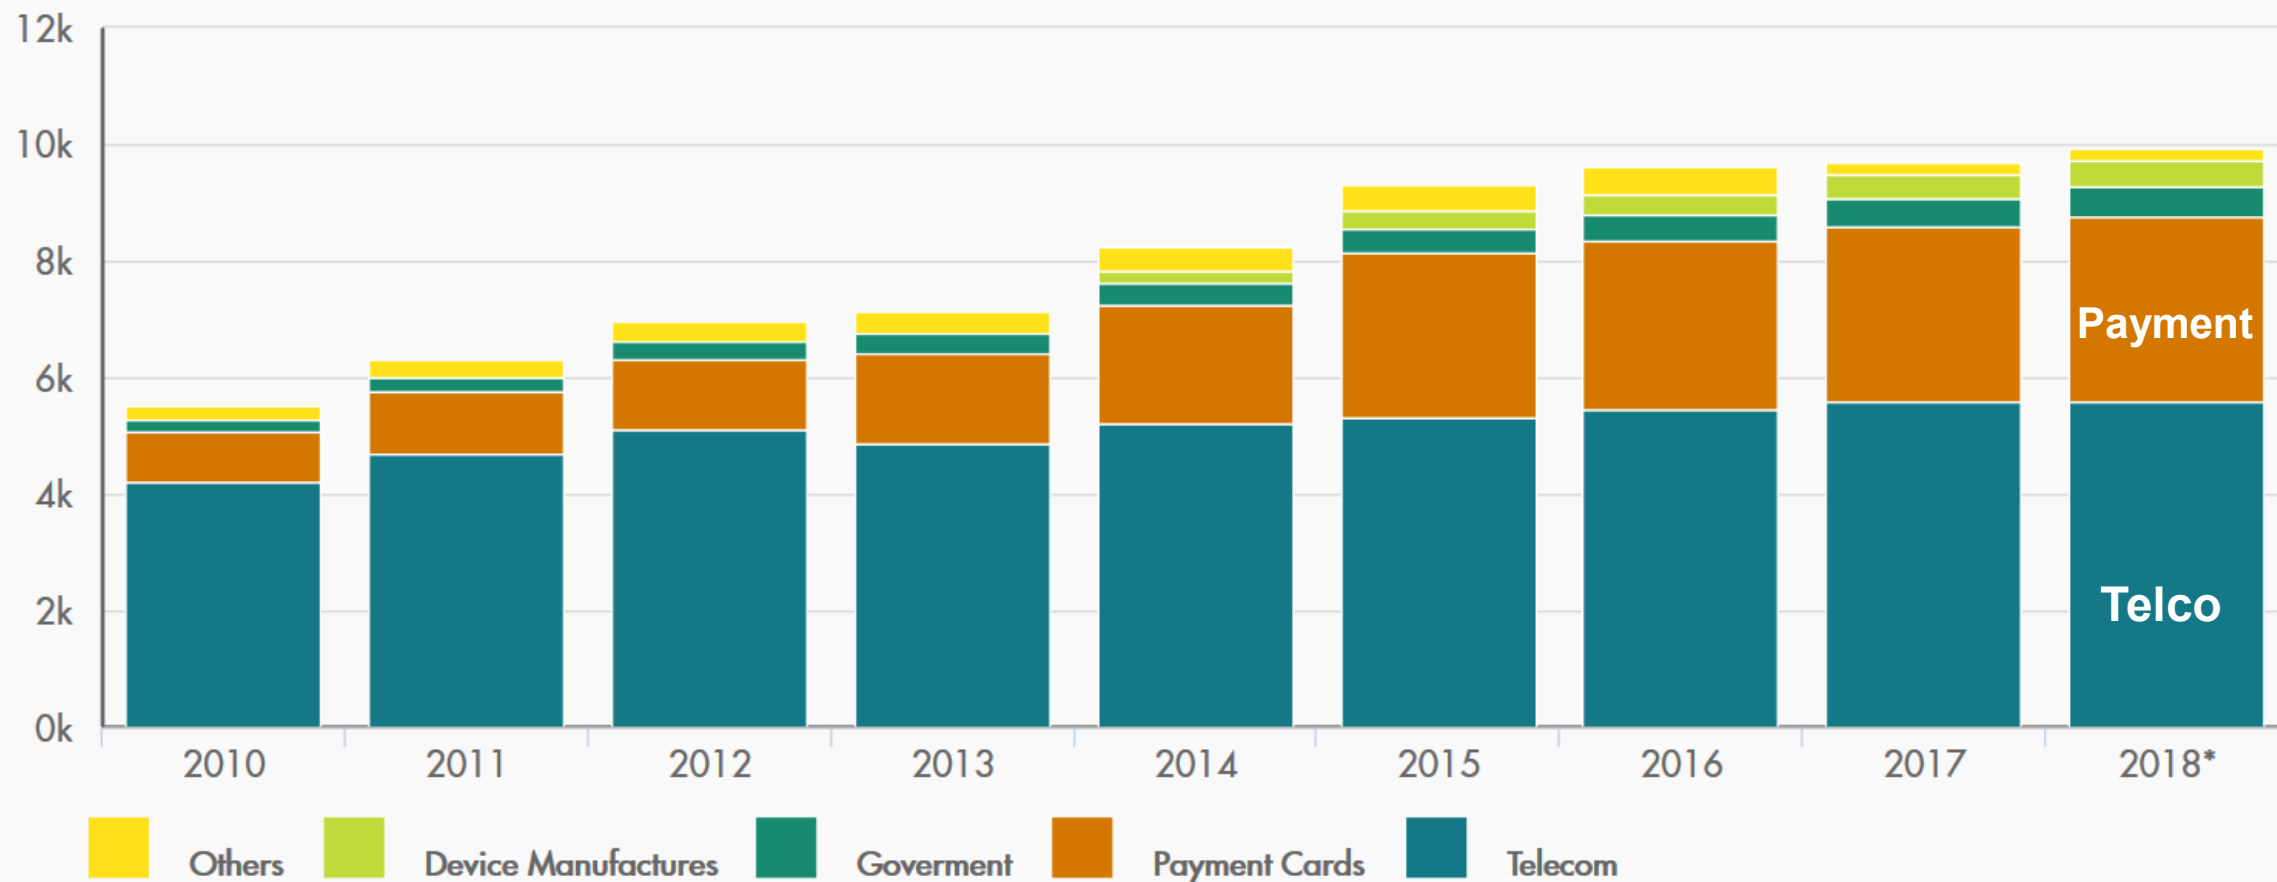

We will mainly focus on these two categories

Cryptographic smart cards

- SC is quite powerful device
 - 8-32 bit processor @ 5-50MHz
 - persistent memory 32-100s kB (EEPROM)
 - volatile fast RAM, usually <<20kB
 - truly random generator, cryptographic coprocessor (3DES, AES, RSA-2048...)
- ~10 billion units shipped in 2018 (EUROSMART)
 - mostly smart cards, telco, payment and loyalty...
 - ~1.5 billion contactless (EUROSMART)
- Intended for physically unprotected environment
 - NIST FIPS140-2 standard, security Level 4
 - Common Criteria EAL4+/5+

Secure elements shipments from 2010 to 2016 & 2017-18 forecasts (Millions of units)

<http://www.eurosmart.com/facts-figures.html>

Smartcards used in wider system

Big picture – terminal/reader and card

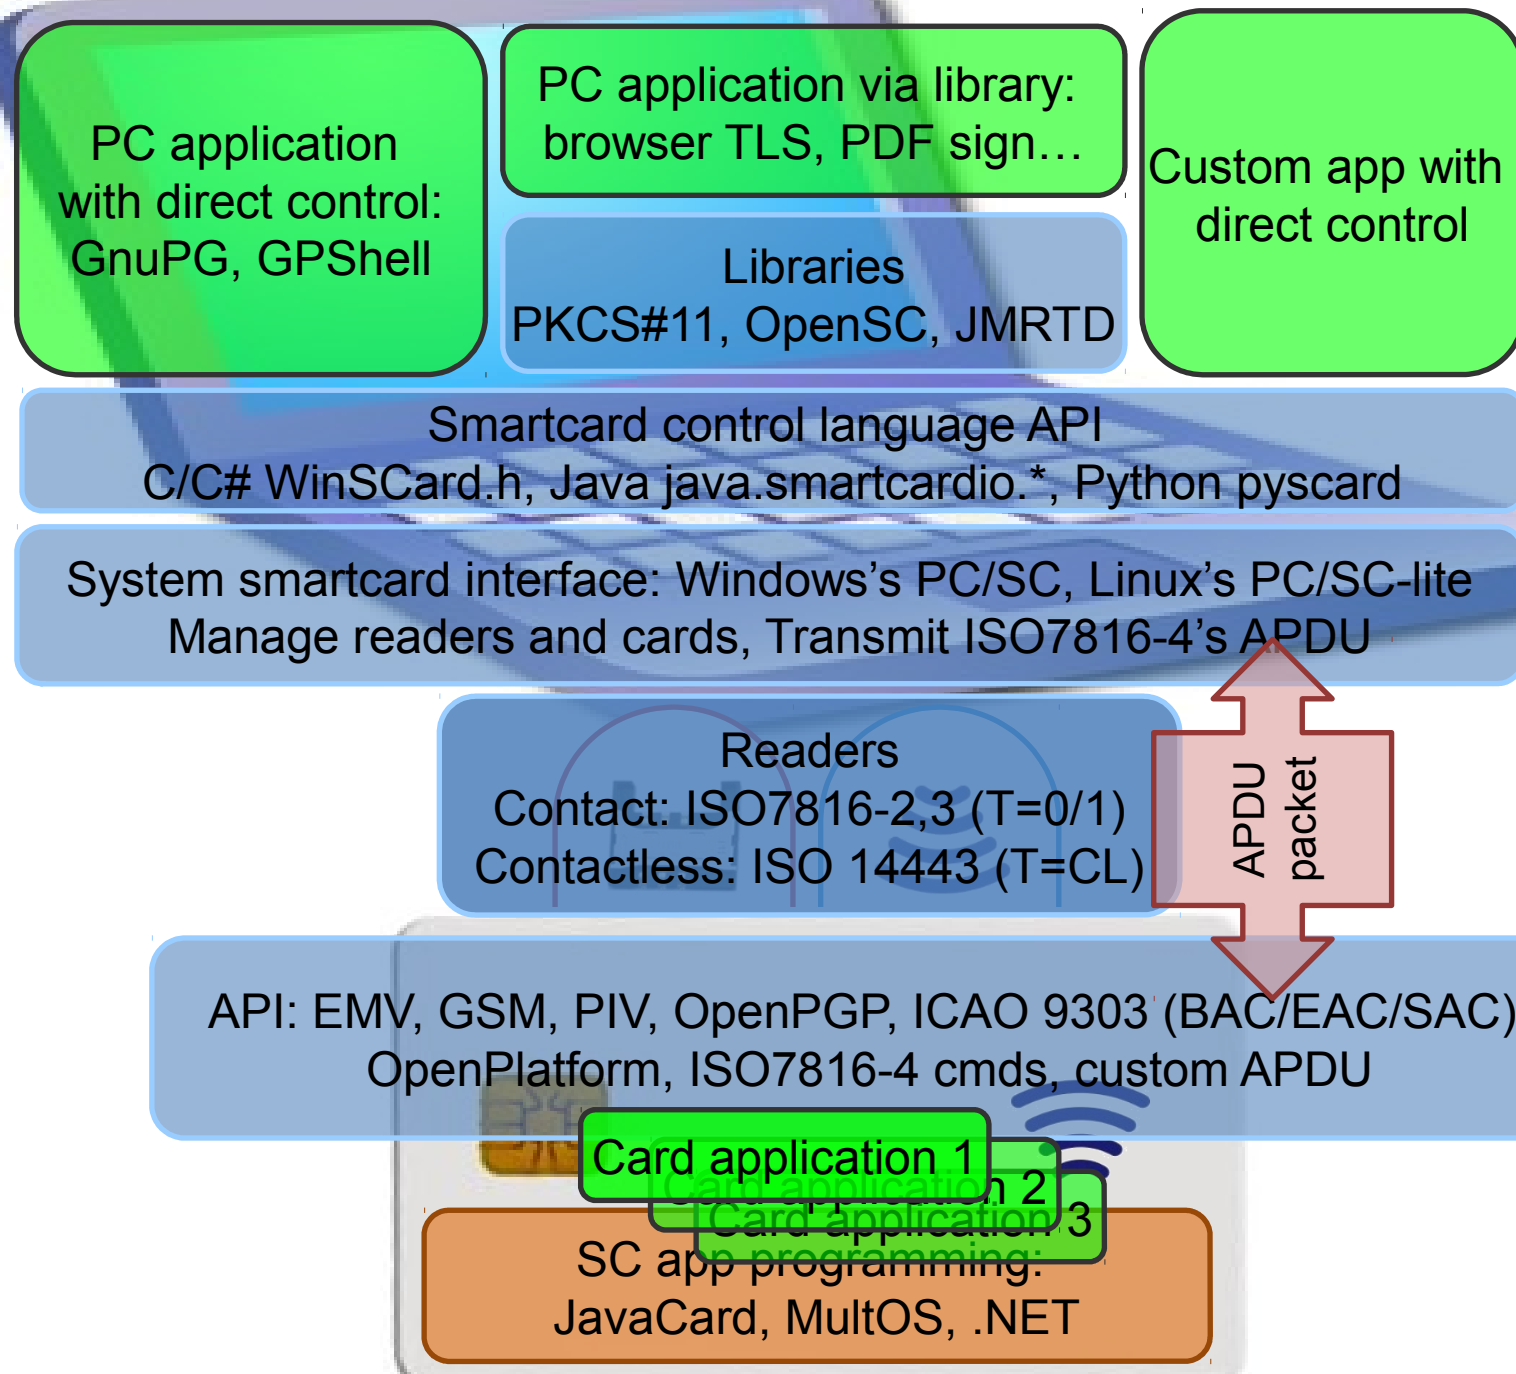

What principles and standards are used?

Group activity: smartcard stack

- (Imagine e.g., digital signature application with private key on smartcard)
- Organize and glue floating items into smartcard stack
- Use internet... (but don't google for my slides from previous years 😊)
- Annotate with own comment (what is the item about)
- (15 minutes)

- Combine results found by groups
- (5 minutes)

APDU (Application Protocol Data Unit)

- APDU is basic logical communication datagram
 - header (5 bytes) and up to ~256 bytes of user data
- Format specified in ISO7816-4
- Header/Data format
 - CLA – instruction class
 - INS – instruction number
 - P1, P2 – optional data
 - Lc – length of incoming data
 - Data – user data
 - Le – length of the expected output data
- Some values of CLA/INS/P1/P2 standardized
- Custom values used by application developer

What values of APDU header are used?

- Standardized values for selected application
 - Improves interoperability
 - <https://web.archive.org/web/20180721010834/http://techmeonline.com/most-used-smart-card-commands-apdu/>
- Custom commands for proprietary application
 - Your own API

Smartcard algorithms and performance

Common algorithms

- Basic - cryptographic co-processor
 - Truly random data generator
 - 3DES, AES128/256
 - MD5, SHA1, SHA-2 256/512
 - RSA (up to 2048b common, 4096 possible)
 - ECC (up to 192b common, 384b possible)
 - Diffie-Hellman key exchange (DH/ECDSA)
- Custom code running in secure environment
 - E.g. HMAC, OTP code, re-encryption
 - Might be significantly slower (e.g., SW AES 50x slower)

Cryptographic operations

- Supported algorithms (JCAlgTester, almost 90 cards)
 - <https://github.com/crocs-muni/JCAlgTest>
 - <https://www.fi.muni.cz/~xsvenda/jcsupport.html>

javacard.security.MessageDigest	introduced in JavaCard version	c0	c1	c2	c3	c4	c5	c6	c7	c8	c9	c10	c11	c12	c13

What is the typical performance?

- Hardware differ significantly
 - Clock multiplier, memory speed, crypto coprocessor...
- Typical speed of operation is:
 - Milliseconds (RNG, symmetric crypto, hash)
 - Tens of milliseconds (transfer data in/out)
 - Hundreds of millisecond (asymmetric crypto)
 - Seconds (RSA keypair generation)

Operation may consists from multiple steps

- Transmit data, prepare key, prepare engine, encrypt
- → additional performance penalty

Performance tables for common cards

- Visit <https://jcalgtest.org>

Is faster always better?

What influences the speed?

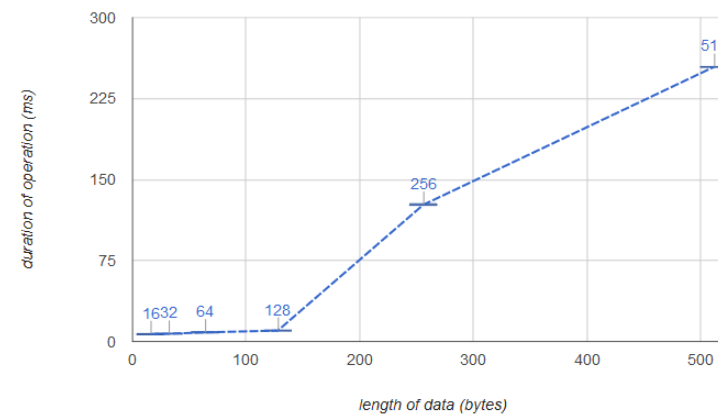

CARD/FUNCTION (ms/op)	SECURE RANDOM (256B)	SHA-1 hash (256B)	SHA2-256 hash (256B)	3DES encrypt (256B)	AES128 encrypt (256B)	AES256 encrypt (256B)	3DES setKey(192b)	AES setKey(128b)
Gemplus GXP R4 72K	2.45	3.69	-	53.71	26.05	31.52	9.4	9.28

RSA PRIVATE 1024	203	152	141
RSA CRT PRIVATE 2048	61	51	47
RSA PRIVATE 2048	108	82	77

Smart card management

What functionality would require?

Motivation

- How to upload, install and remove applications?
- Who should be allowed to upload/remove apps?
- What if multiple mutually distrusting apps on card?
- How to update application in already issued card?

- Need for cross-platform interoperable standard
 - Many manufactures and platform providers

GlobalPlatform

- Specification of API for card administration
 - Upload/install/delete applications
 - Card lifecycle management
 - Card security management
 - Security mechanisms and protocols
- Newest is GlobalPlatform Card Specification v2.3
 - December 2015
 - Previous versions also frequently used
 - <http://www.globalplatform.org/specificationscard.asp>

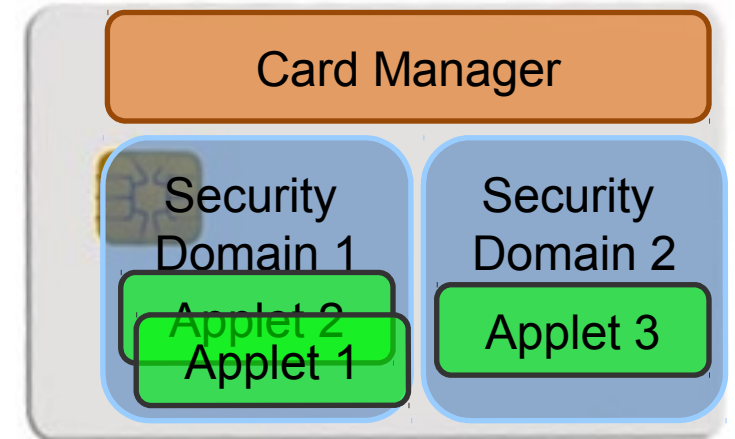

GlobalPlatform – main terms

- Smart card life cycle
 - OP_READY, INITIALIZED (prepared for personalization)
 - SECURED (issued to user, use phase)
 - CARD_LOCKED (temporarily locked (attack), unlock to SECURED)
 - TERMINATED (logically destroyed)
- Card Manager (CM)
 - Special card component responsible for administration and card system service functions (cannot be removed)
- Security Domain (SD)
 - Logically separated area on card with own access control
 - Enforced by different authentication keys

GlobalPlatform – main terms

- Card Content (apps,data) Management
 - Content verification, loading, installation, removal
- Security Management
 - Security Domain locking, Application locking
 - Card locking, Card termination
 - Application privilege usage, Security Domain privileges
 - Tracing and event logging
- Command Dispatch
 - Application selection
 - (Optional) Logical channel management

Card Production Life Cycle (CPLC)

- Manufacturing metadata
- Dates (OS, chip)
- Circuit serial number
- (not mandatory)
- GlobalPlatform APDU
 - 80 CA 9F 7F 00
 - gppro --info
- ISO7816 APDU
 - 00 CA 9F 7F 00

CPLC info

IC Fabricator: 4790

IC Type: 5167

OS ID: 4791

OS Release Date: 2081

OS Release Level: 3b00

IC Fabrication Date ((Y DDD) date in that year): 4126

IC Serial Number: 00865497

IC Batch Identifier: 3173

IC Module Fabricator: 4812

IC Module Packaging Date: 4133

IC Manufacturer: 0000

IC Embedding Date: 0000

IC Pre Personalizer: 1017

IC Pre Personalization Equipment Date: 4230

IC Pre Personalization Equipment ID: 38363534

IC Personalizer: 0000

IC Personalization Date: 0000

IC Personalization Equipment ID: 00000000

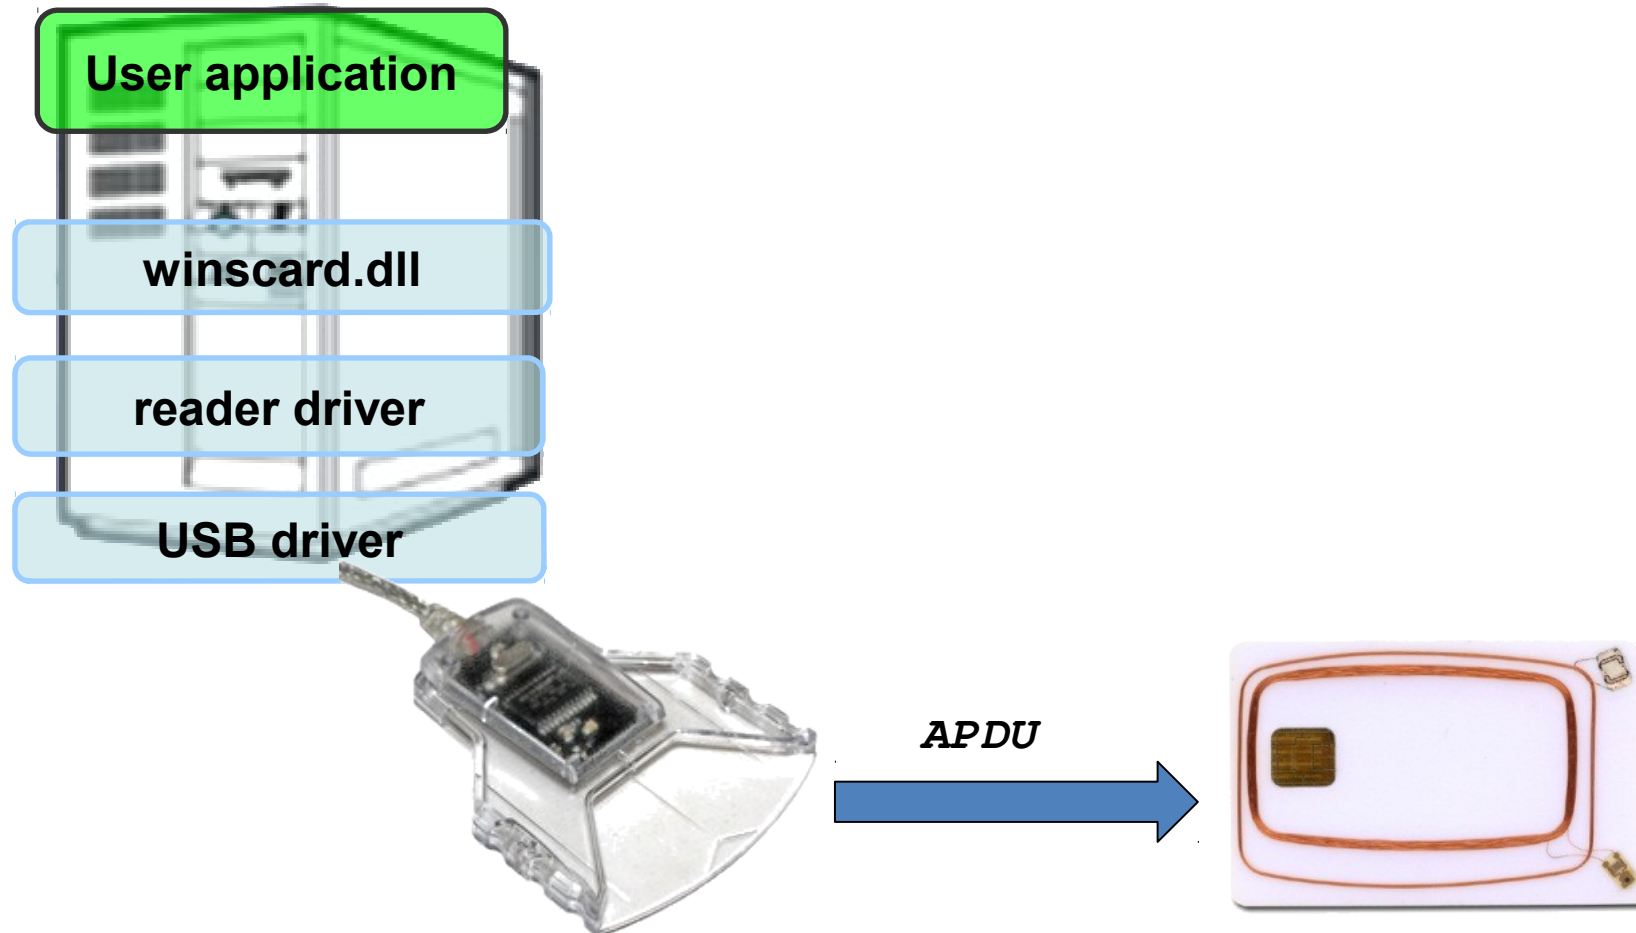

Two factor authentication

Two-factor authentication

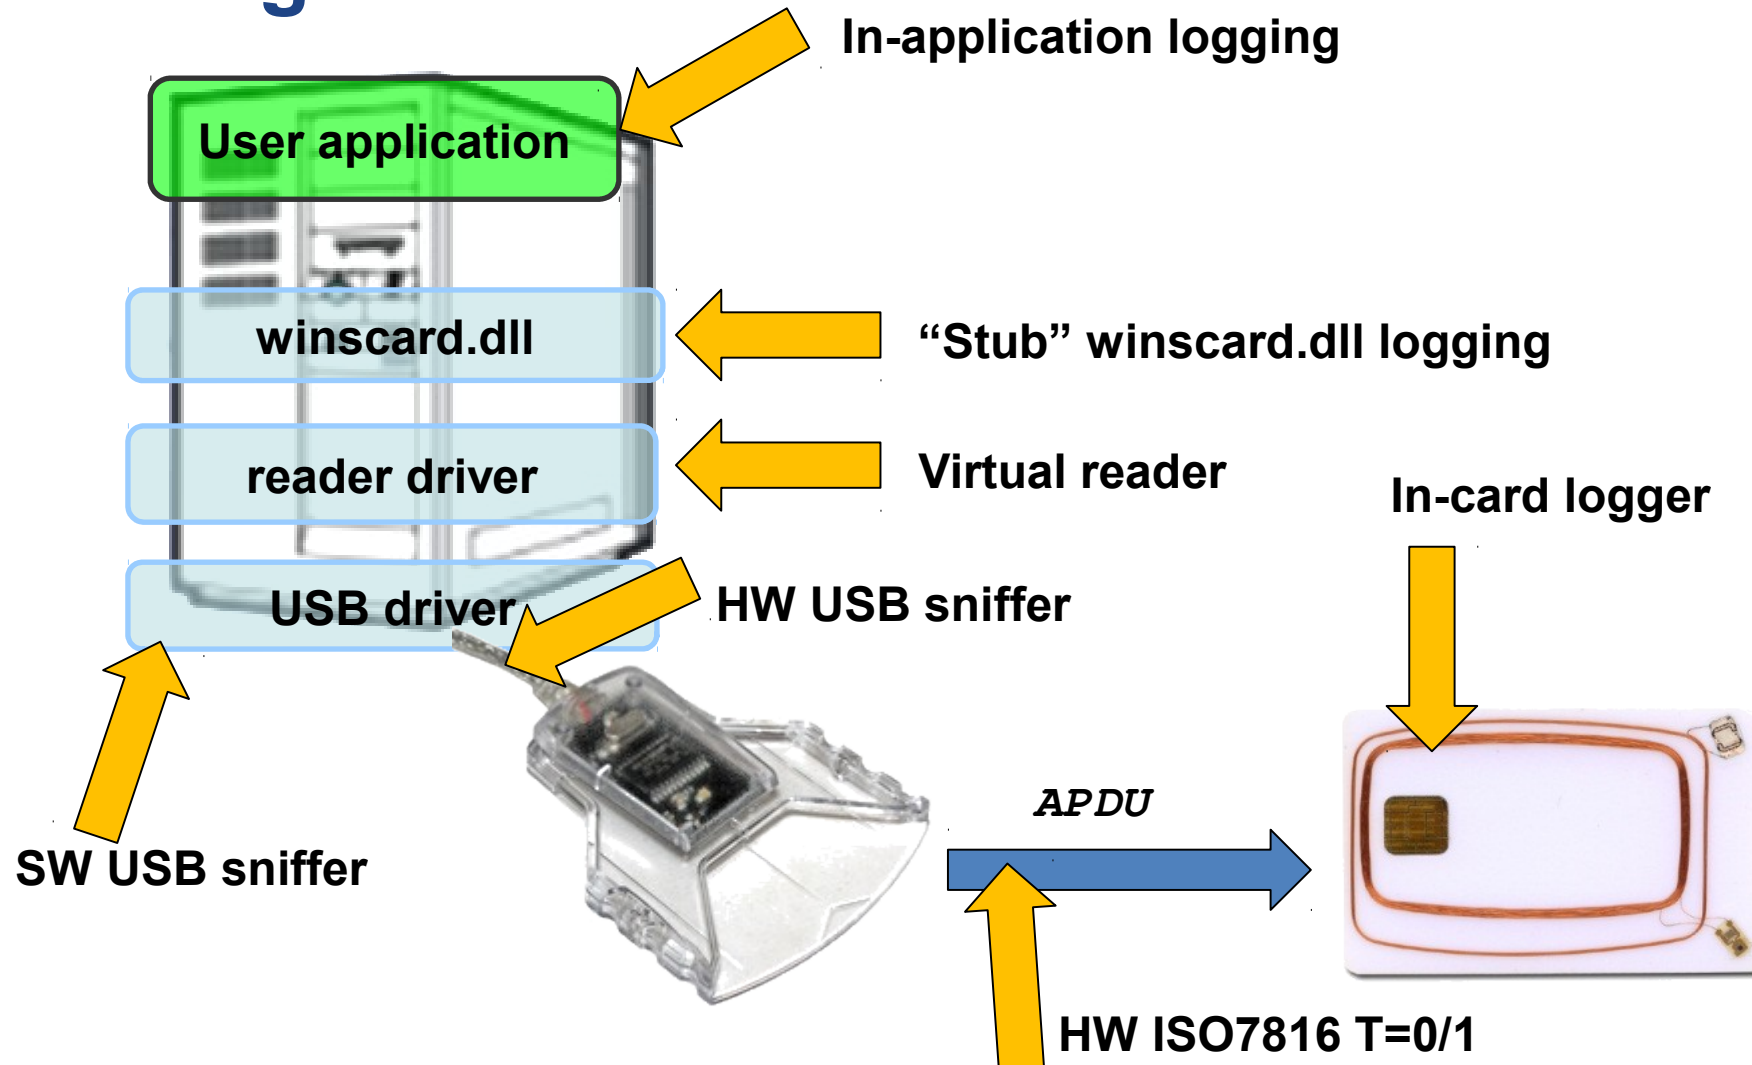

- Two factors with tokens/smart cards
 - Token (smart card, phone) + Knowledge (PIN, Password)
- 1. Authorize transaction with card and PIN
- 2. Authenticate with password and SMS
- 3. Authenticate user with One-Time Password (OTP) generated on mobile phone (stored secret key) after screen unlock (pattern)
- 4. U2F token (password + token + button press)
- 5. ...

 How to attack two-factor?

Application uses PC/SC interface (SCardxx)

Where to log communication?

For attacking two-factor, logging is usually not enough

- Manipulate incoming/outgoing APDUs
 - modify packet content (change receiver account number)
 - replay of previous packets (pay twice)
 - simulate presence of smart card
 - ...

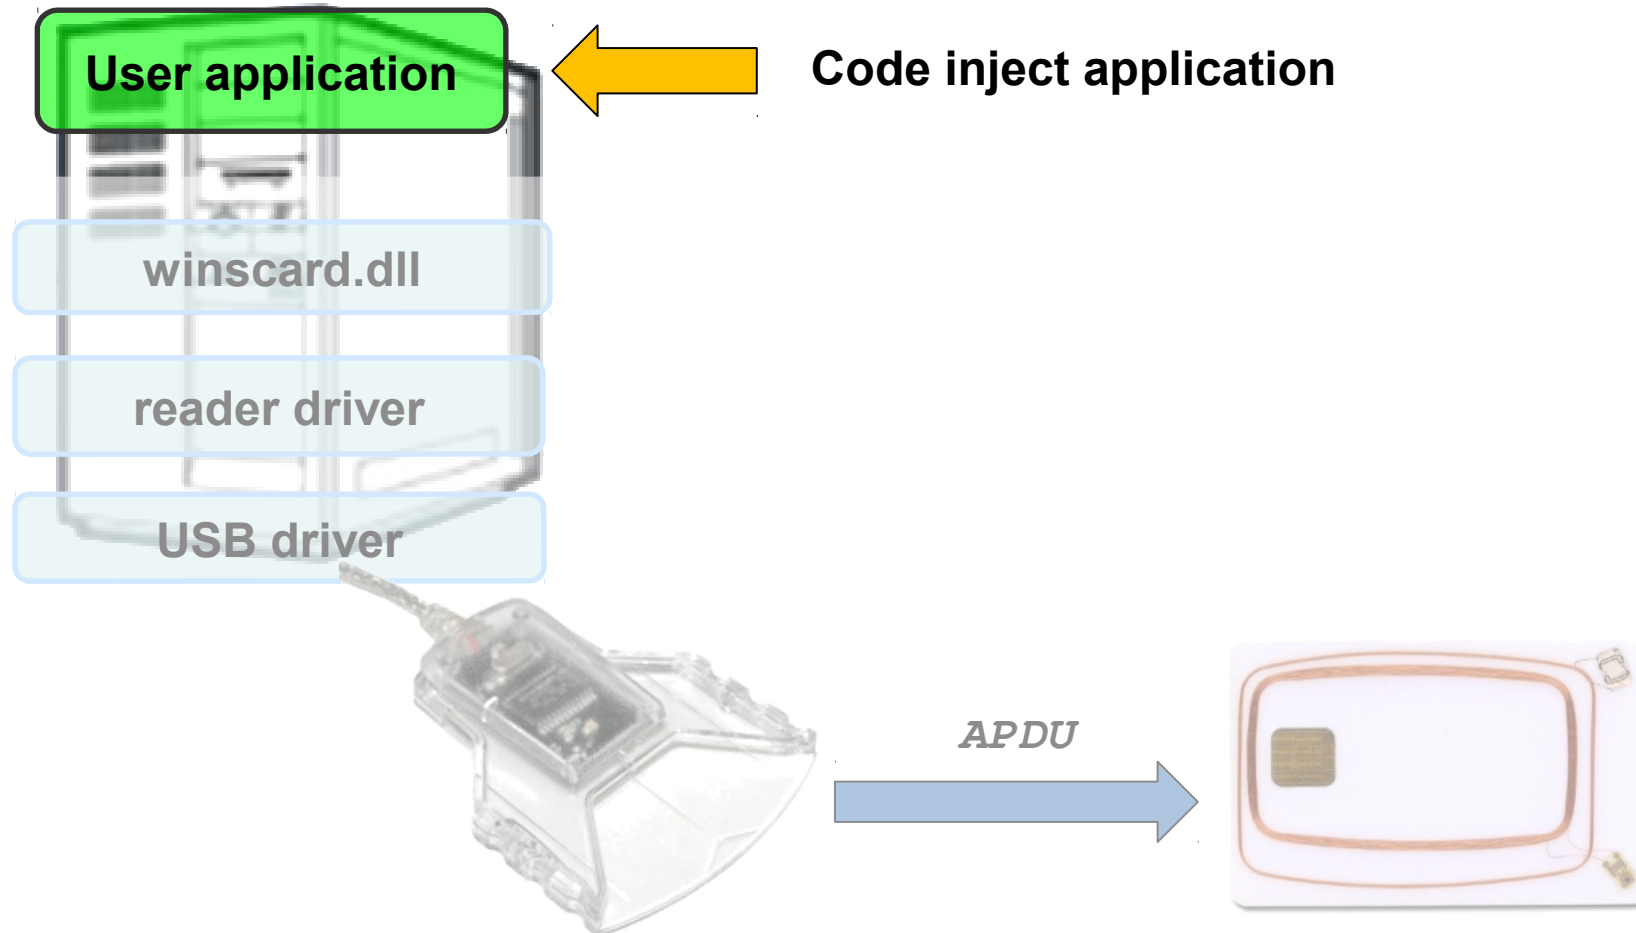

```
[RULE1]
MATCH1=in=1;t=0;cla=00;ins=a4;p1=04;
ACTION=in=0;data0=90 00;le=02;
```

German banking malware (2009)

- Two-factor authorization of transactions (chipTAN/cardTAN)
- Application code injection
 - modifies info about transaction and balance shown to user in browser
 - intercepts/modifies transaction data for signature by smart card
 - <http://www.cio.com/article/2429854/infrastructure/german-police--two-factor-authentication-failing.html>
- The Fairy Tale of “What You See Is What You Sign” - Trojan Horse Attacks on Software for Digital Signatures (2001)
 - <http://www.hanno-langweg.de/hanno/research/scits01p.pdf>
 - Importance of physical PIN-pad and display of transaction amount independently

German banking malware

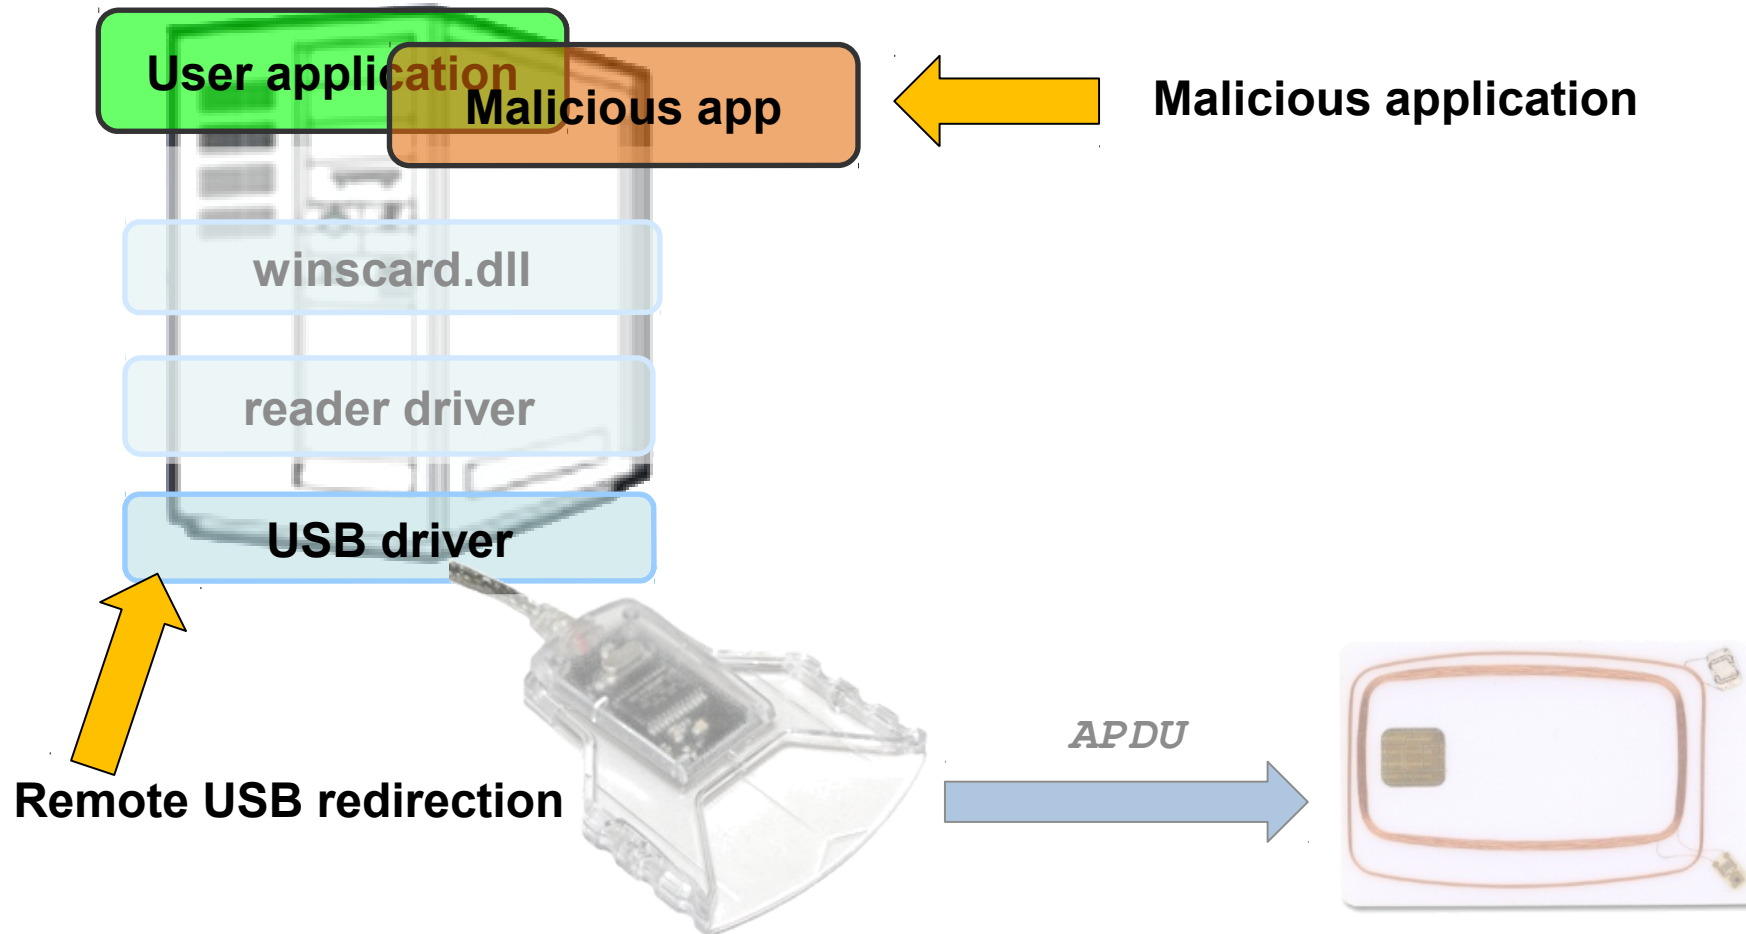

Win32/Spy.Ranbyus [Threat Name]

Detection created	2010-09-30
World activity peak	2012-12-09 (0.21 %)

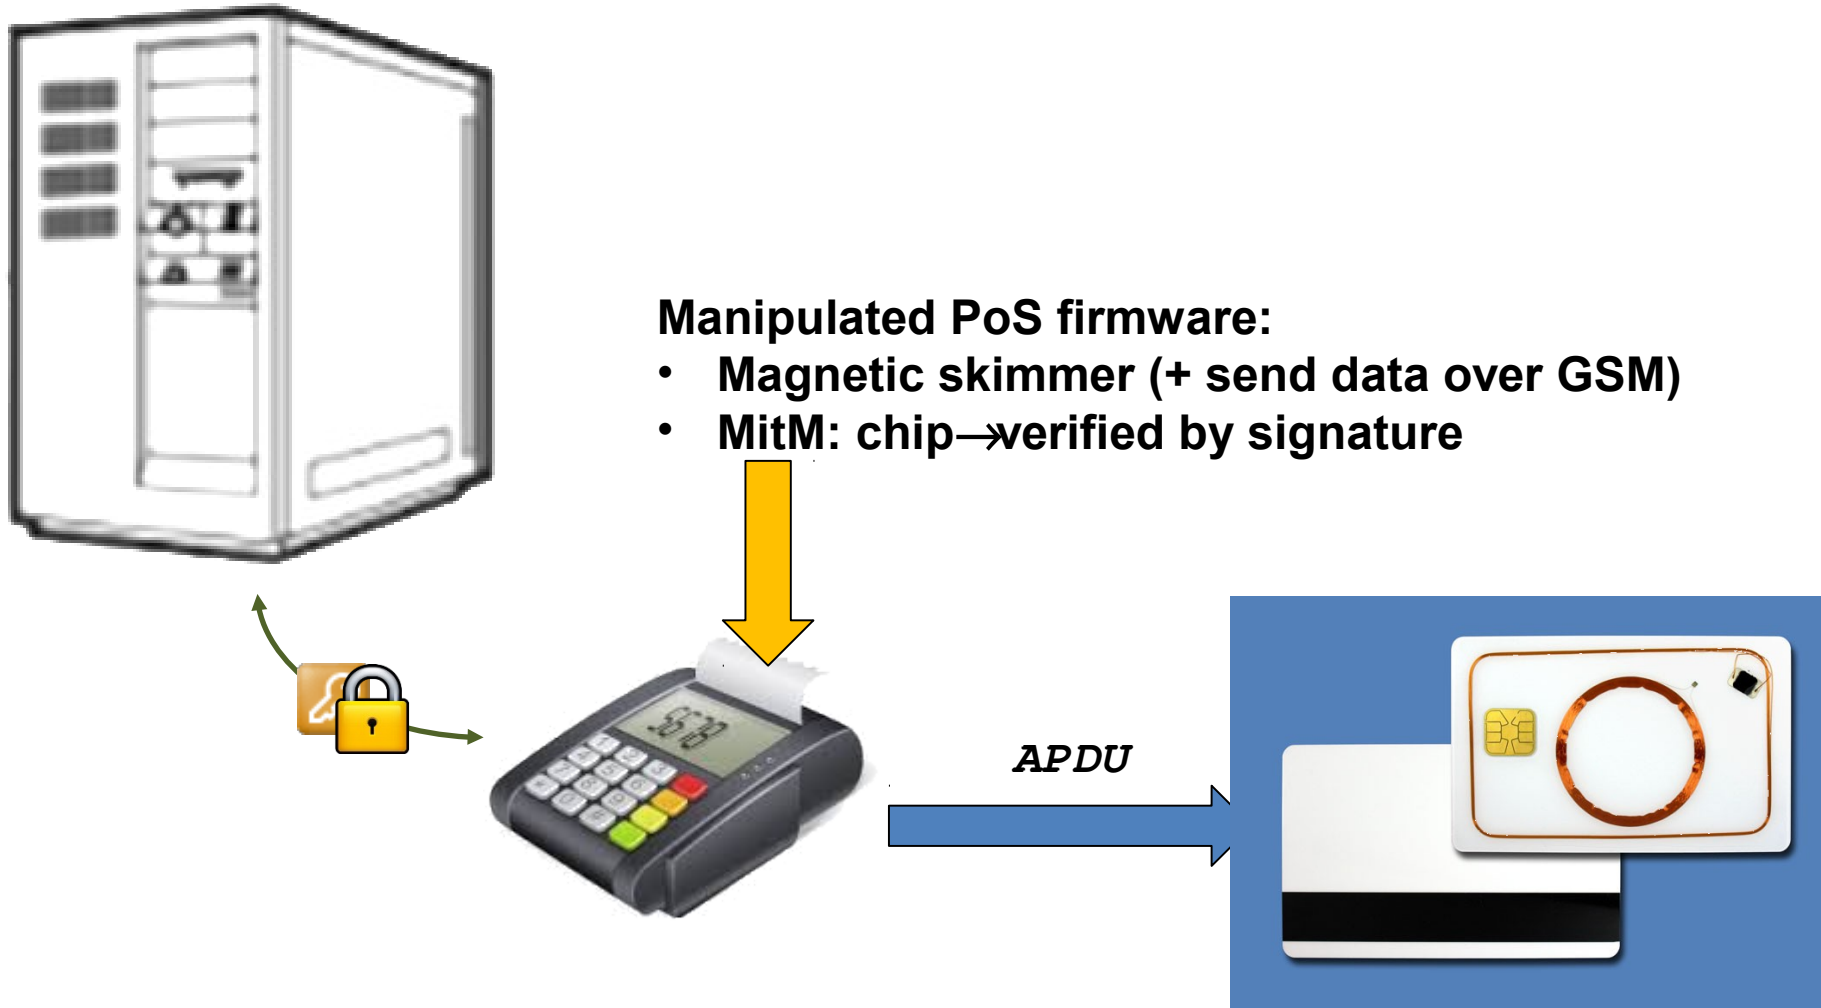

Win32/Spy.Ranbyus

- Analysed by A. Matrosov
 - <http://www.welivesecurity.com/2012/06/05/smartcard-vulnerabilities-in-modern-banking-malware/>
- Scans for available smart cards, info send to C&C
 - uses PC/SC SmartCard API for scan
 - later redirects communication on USB level (FabulaTech USB for RD installed)

Win32/Spy.Ranbyus

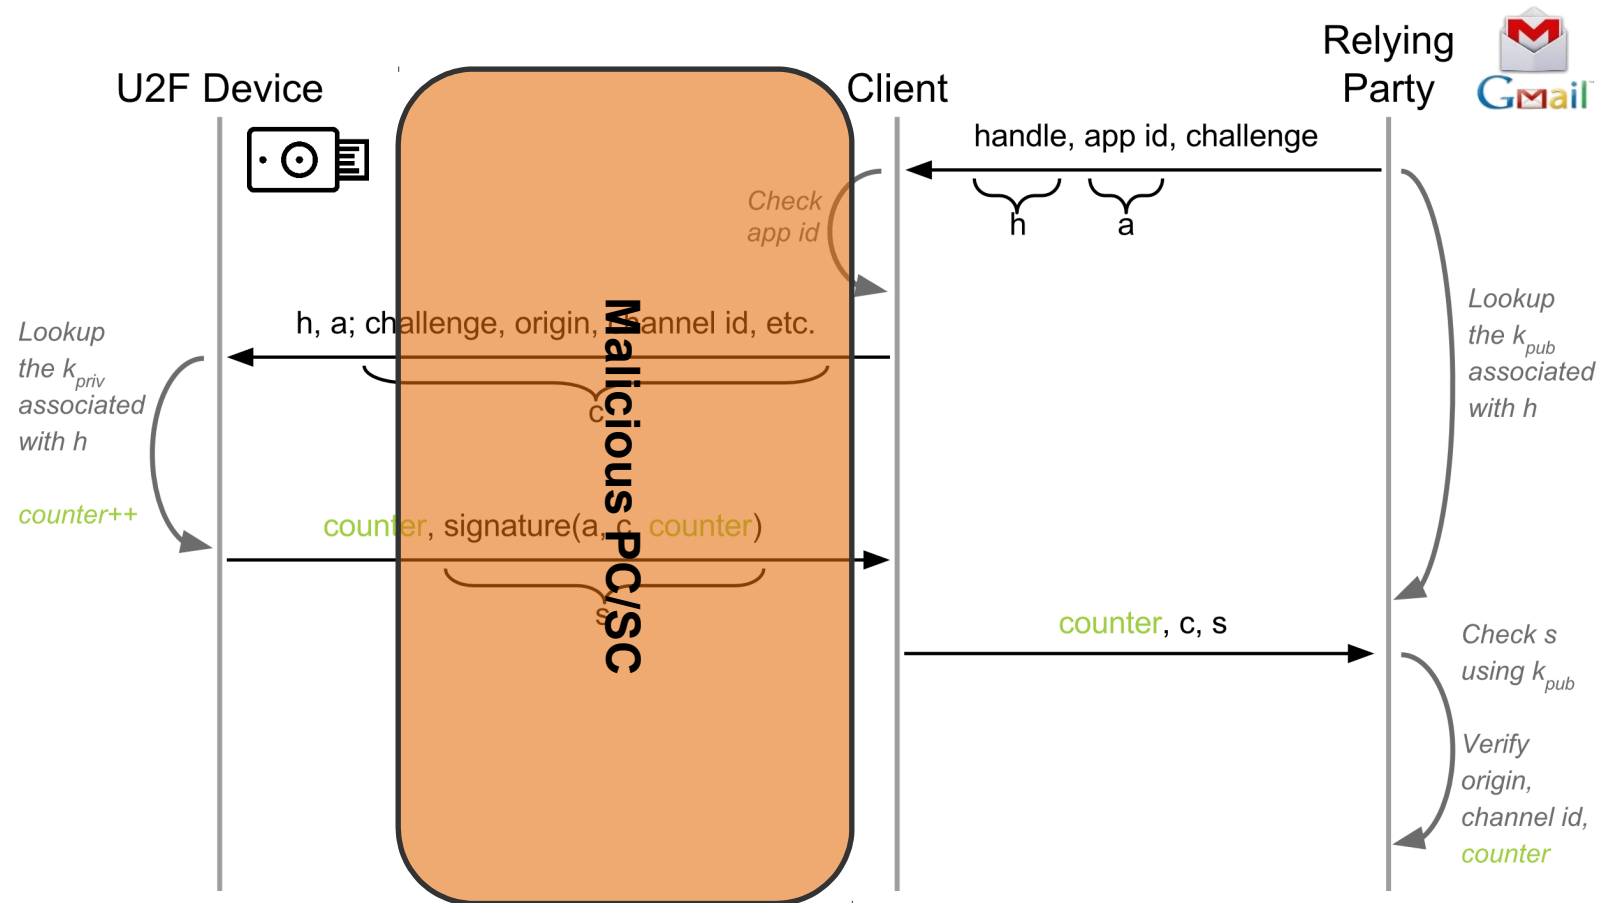

Skimmers, PoS hacks

Recall U2F

how can you attack U2F if PC/SC layer is controlled?

FIDO U2F protocol

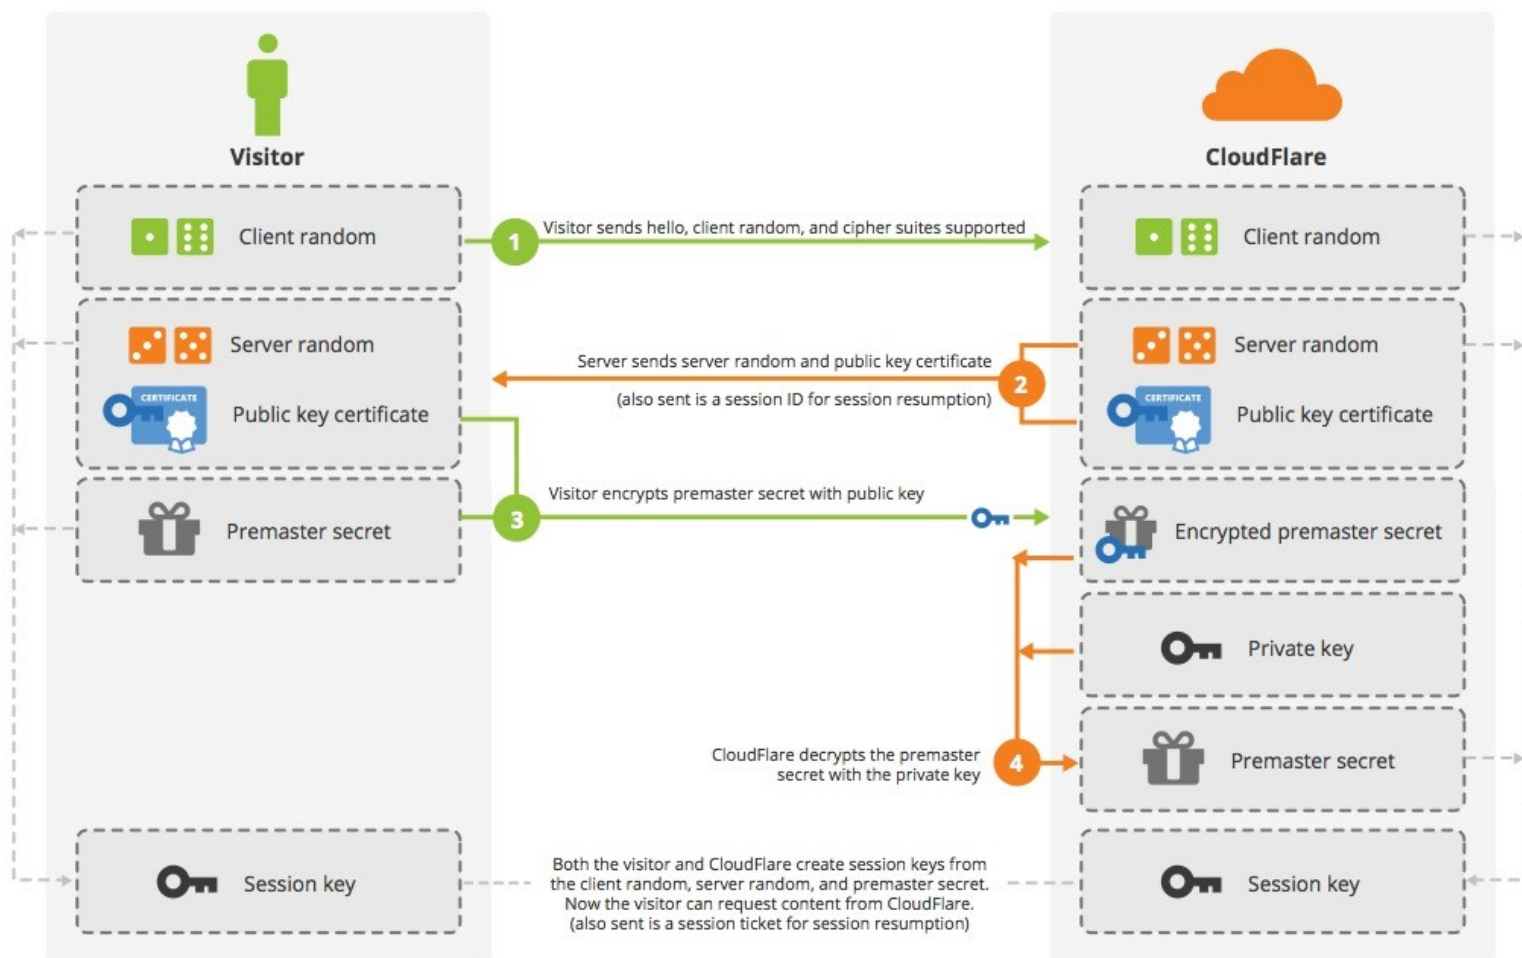

https://developers.yubico.com/U2F/Protocol_details/Overview.html

How to authenticate and communicate securely?

Secure channel Protocol (for smartcards)

TLS handshake

Credit: Cloudflare

Why not to use TLS all the time?

1. Requires asymmetric cryptography
 - Unsuitable for slower devices
 2. Requires long keys
 - Unsuitable for devices with small memory
 3. Requires significant data overhead (~6.5KB)
 - <http://netsekure.org/2010/03/tls-overhead/>
 4. More lightweight protocols exist
 - RFID / smartcards / IoT...
- Note: TLS can be fully implemented on smartcards (but slow)
 - https://github.com/gilb/smart_card_TLS

Common lightweight SCPs

- OpenPlatform SCP'01,'02 (3DES-based)
- OpenPlatform SCP'10 (RSA-based)
- OpenPlatform SCP'03 (AES-based)
- ISO/IEC 7816-4 Secure Messaging
- ePassports Basic Access Control (3DES-based)
- ePassports Extended Access Control (3DES,RSA,DH,SHA1/2-based)

Example: GlobalPlatform SCP'03

- Mutual authentication (based on symmetric crypto)
- Session key derivation (based on long-term keys)
 - NIST SP 800-108
- Message (APDU) confidentiality and integrity MAC

1. INITIALIZE UPDATE

- Random challenge, card's computations

2. EXTERNAL AUTHENTICATE

- Terminal response

3. Secure messaging

What are problems with usage of symmetric crypto?

Mandatory reading

- When Organized Crime Applies Academic Results
 - A Forensic Analysis of an In-Card Listening Device
 - <https://eprint.iacr.org/2015/963.pdf>
- Which academic attacks is of concern?
- What system is targeted?
- How is attack carried out? Is it protocol flaw?
- What can prevent this attack vector?

Conclusions

- Smartcards are highly secure and capable modules
 - Programmable
 - Accessible (cost, API...)
- Protocol stack between PC application and smartcard
 - PC/SC, APDU transfer, GlobalPlatform, JavaCard
- Two-factor authentication is not silver bullet
 - But way better than password alone!

Questions ?
