

Result: 5

The diagram presents the customer removal process. The system receives the order from the customer and with GPS finds the nearest car and finds out if it is free. The car finds the customer and tells him the safety rules and asks him to buckle up. If he does not, the car will buckle him up using the automatic belt. The car takes the customer to the destination and sends a message to the system that it is at the destination. The system will send an email to the customer asking for feedback.
