@OndrejKrajicek

# Architectural Styles

---

# Architectural Styles

---

- Tiered Architecture
- Hexagonal Architecture
- Onion Architecture
- Object Oriented Architecture
- Service Oriented Architecture
- Microservices

Which one is the best one?

- **Consistency**
- **Cohesion**
- **Coupling**
- **Clarity**

**Cost of  
Change**

(affected by technical debt)

How can we measure technical debt?

# Principles over Patterns.

---

Consistency

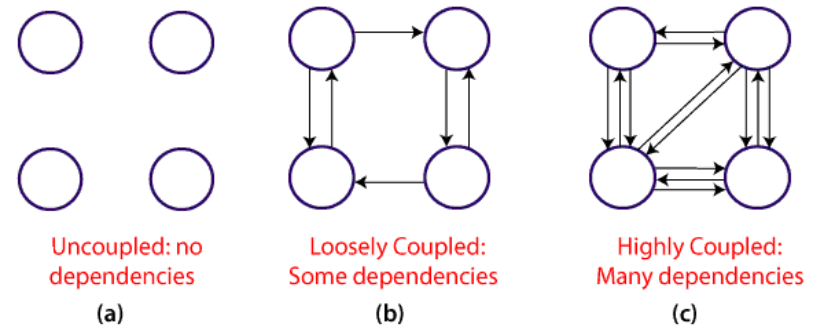

# Module, Data, Service, Interaction Dependencies.

---

## Coupling

### Module Coupling

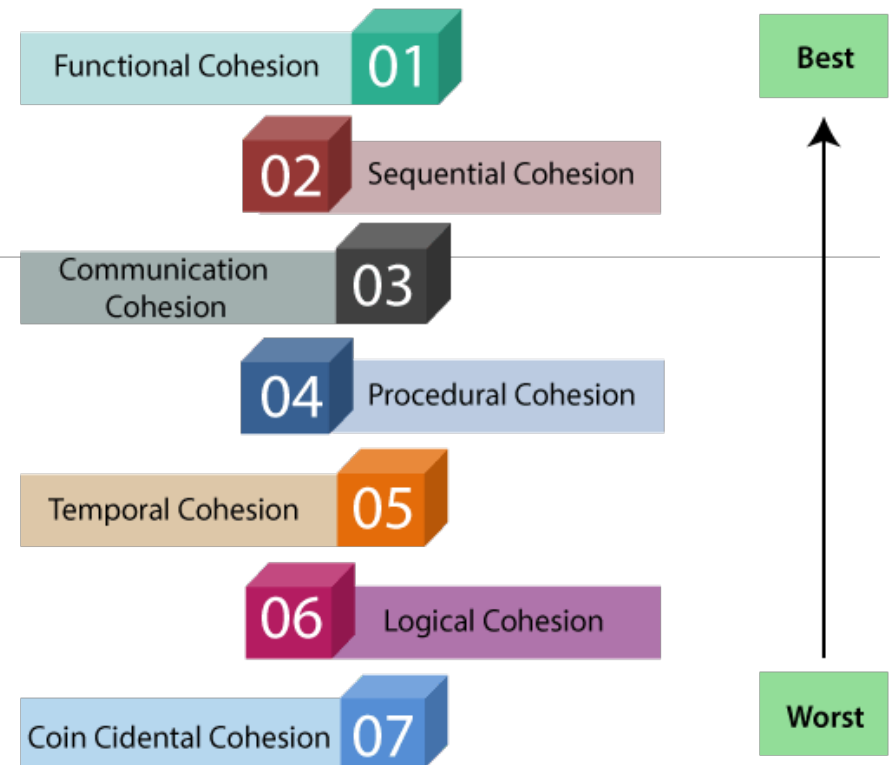

<https://www.javatpoint.com/software-engineering-coupling-and-cohesion>

# Well-Designed or Leaking Abstractions.

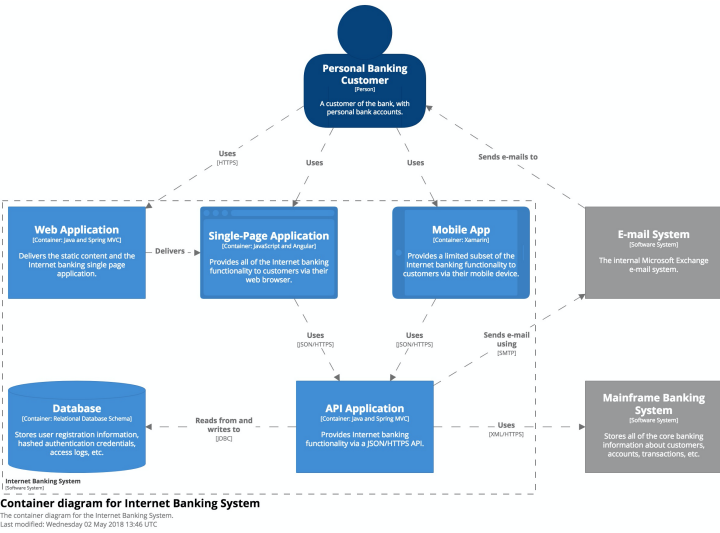

Cohesion

## Types of Modules Cohesion

Everyone understands why, how and what to do. System deteriorates slower and technical debt does not grow quickly.

Clarity

# Replaceable Architecture

---

Wait, what?

Osaka Castle

Giza Pyramids

- Built to last: hundreds and thousands of years.
- Built to survive natural disasters, especially earthquakes (shinbashira).
- Both have very different architecture.
- You cannot replace one with the other.
- Why would you?

Replaceable as in ***Having rather low Cost of Change***

---

How to decrease Cost of Change?

## 2-Tier Architecture

---

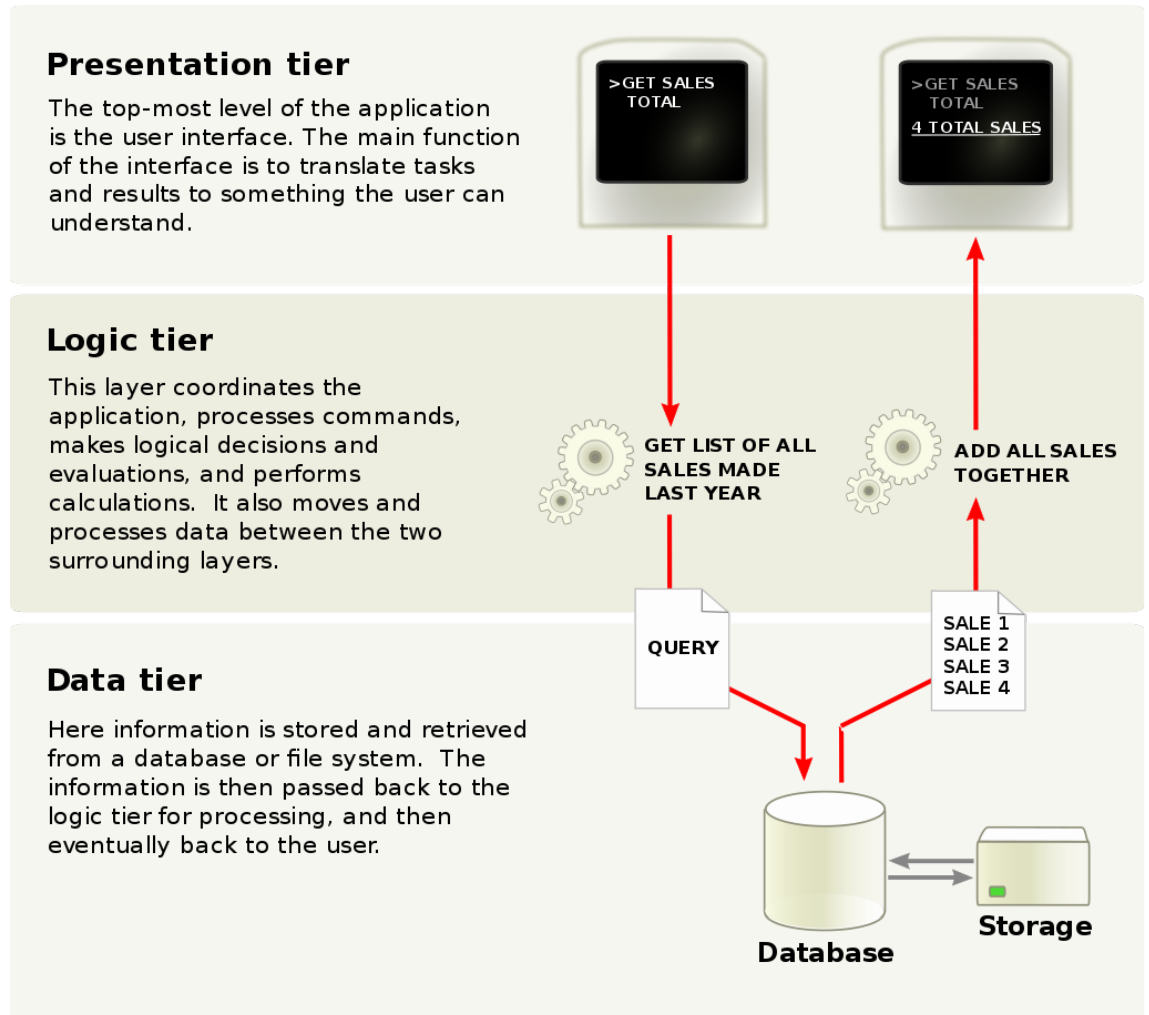

- Original Client / Server
- Business Logic is implemented on the client, server or both.
- What are the issues?

# 3-Tier Architecture

- Decouple presentation from business logic. Business logic is isolated from client and server.
- Business layer often historically hosted in *application* servers with obscure technologies (j2ee, Microsoft ASP, PHP, ColdFusion, etc.).
- How is it different from 2-Tier?

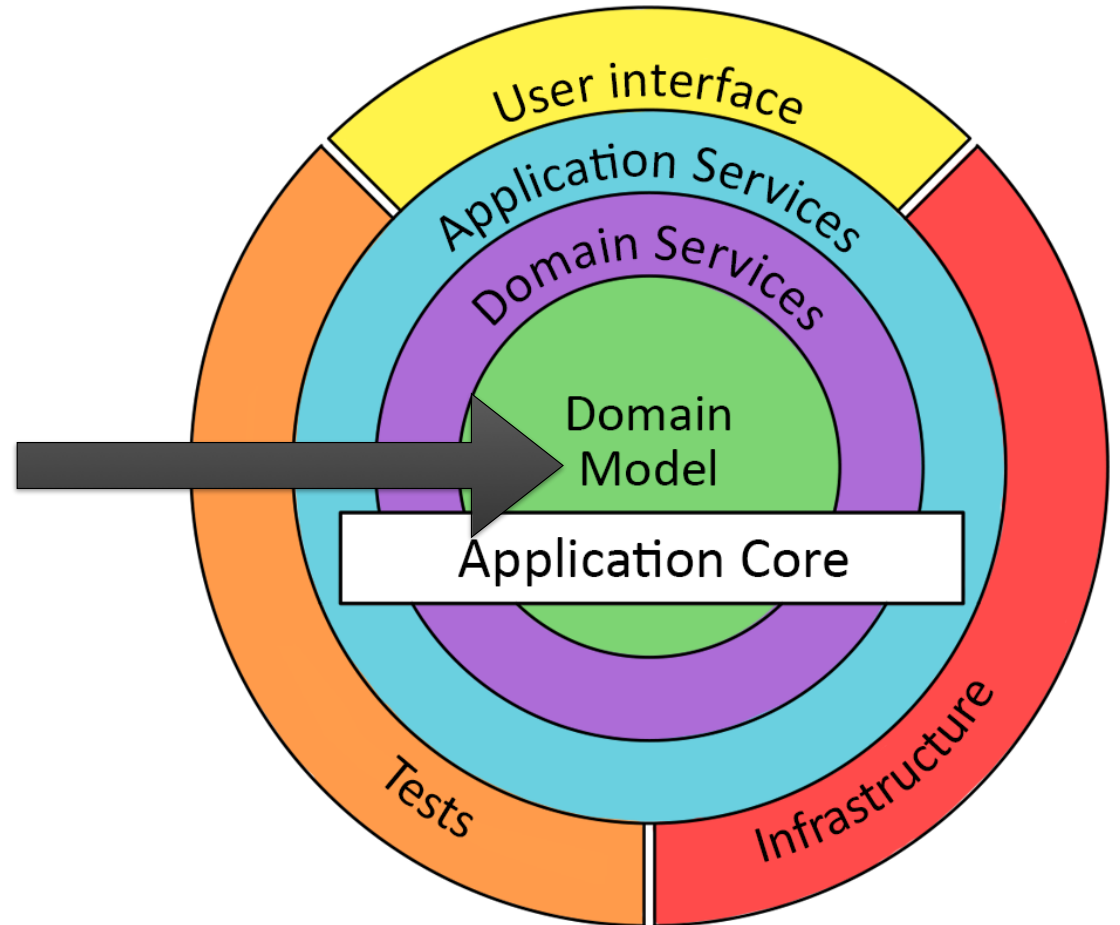

[https://en.wikipedia.org/wiki/Multitier\\_architecture#/media/File:Overview\\_of\\_a\\_three-tier\\_application\\_vectorVersion.svg](https://en.wikipedia.org/wiki/Multitier_architecture#/media/File:Overview_of_a_three-tier_application_vectorVersion.svg)

# Onion Architecture

---

- Built on the observation that most / all interfaces are alike.
- Outer layers depend on inner layers.
- Inner layers must not depend on outer layers.
- Enforces Inversion of Control.
- How is it different from N-Tier?

# Hexagonal Architecture

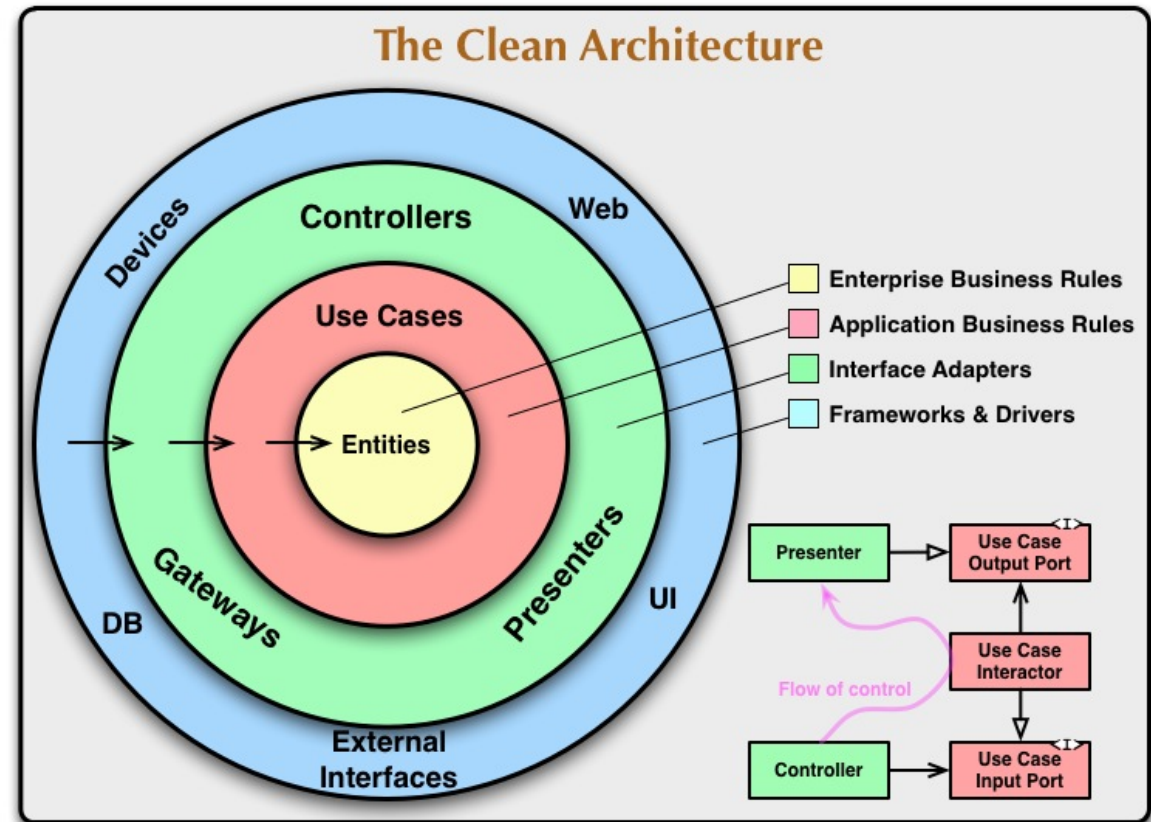

---

- Ports and Adapters Architecture
- Sometimes Onion and Hexagonal are viewed as the same.
- Hexagonal Architecture is more explicit and structured.
- Recommended reading:  
<https://herbertograca.com/2017/11/16/explicit-architecture-01-ddd-hexagonal-onion-clean-cqrs-how-i-put-it-all-together/>

# The Clean Architecture

- Onion + Screaming Architecture.
- Independent of Frameworks.
- Testable: all parts and as a whole.
- Independent of Interfaces.
- Independent of the data store / database / object persistence.
- Independent of any external impact.

Microservices

also known as the *current silver bullet*.

<https://www.cgl.ucsf.edu/Outreach/pc204/NoSilverBullet.html>

# Conway's Law

Organization structure determines system architecture / design.

<https://medium.com/@learnstuff.io/conways-law-in-software-dev-3aa6324ead52>

As the systems get larger, complexity grows quickly and systems become unmanageable.

---

<http://www.laputan.org/mud/mud.html#BigBallOfMud>

- Split system in a set of loosely coupled, cohesive services.
- Each service does only one thing and does it well.
- Each service is represented only by its API.
- Each service has its own data.

---

## Microservices

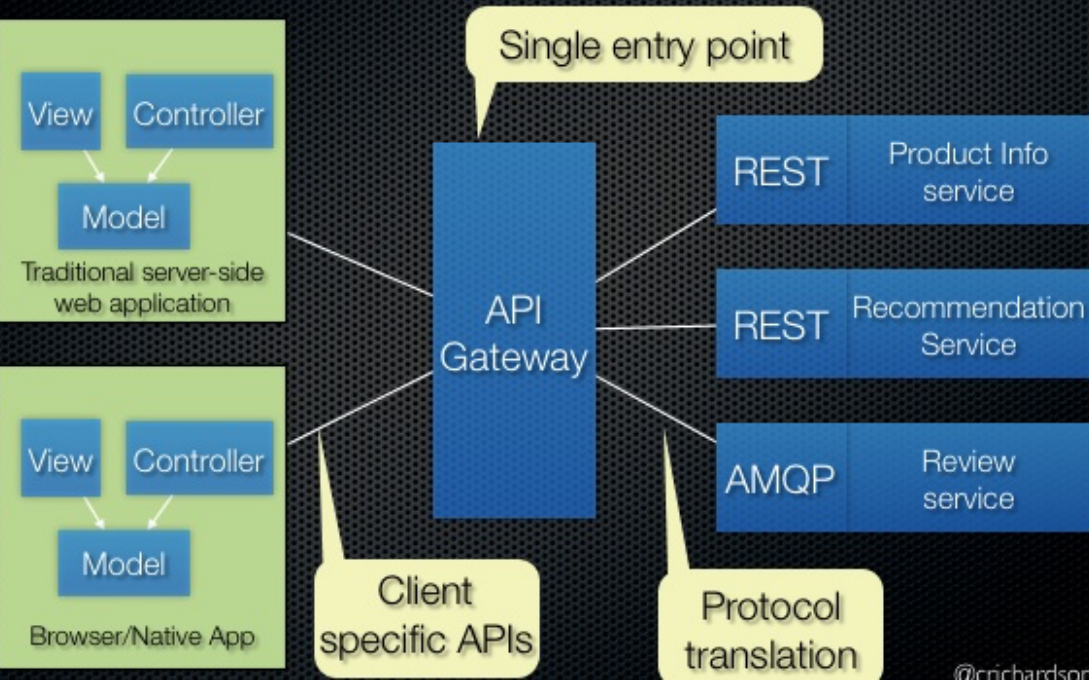

# What are the challenges of Microservices?

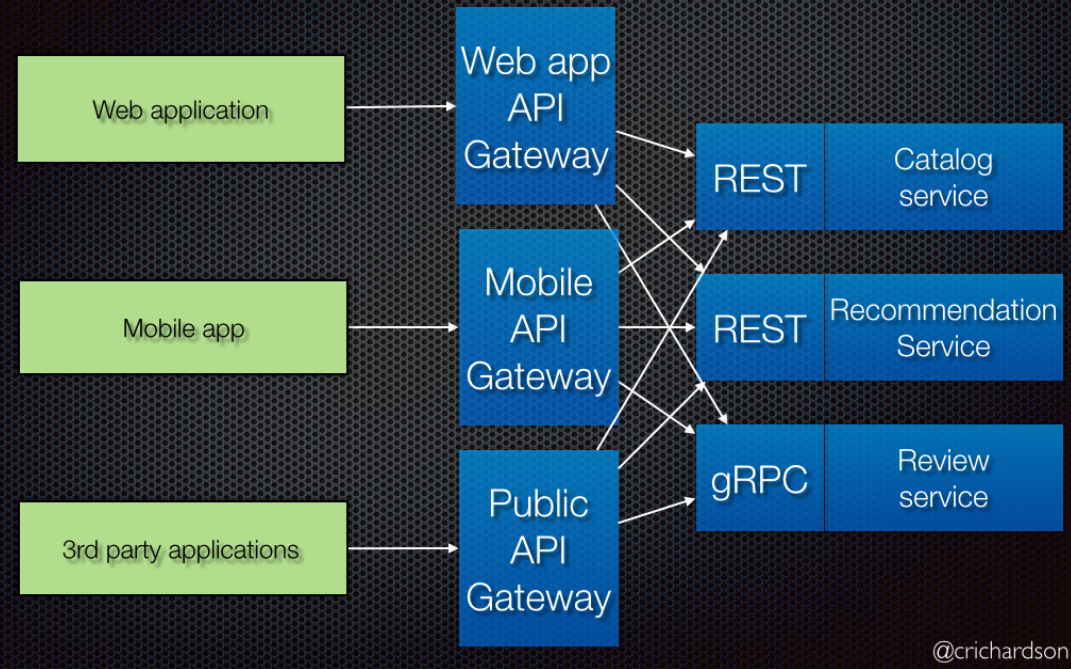

---

Compensating for high decentralisation. Patterns are emerging.

# Use an API gateway

# Variation: Backends for frontends

<https://microservices.io/patterns/apigateway.html>

@crichardson

## API Gateway Pattern

Thank you NETFLIX!

## Key Takeaways

Architectural style is a choice driven by stakeholder values.

Everyone talks about microservices, yet that does not make it the silver bullet.
