

# Bike reservation process

Daniel Jurča, 455426

Registered user can reserve a bike on a specific bike rental checkpoint. When system receives reservation, it validates the res. and verify the payment. Then the reservation is created. If there is problem during the process, user is notified. System generates access token, which is used for locking and unlocking the bike. At the same time, bike is being checked, locked with access token and transported to a checkpoint by bike delivery. At the end, reservation is successfully finished and notification with access token is sent to the user.
