

L2 3D printer model

Marek Bernhauser
456360

Customer wants to print 3D file on a 3D printer. They create order, which is verified both payment wise and printability wise. If file is not printable, customer is notified to modify the model. Customer can also choose if they want the print to be cleaned from supports or not.

-0.5 This should be modeled more into detail or as subprocess.

Would be better to inform the customer.

This looks inconsistent. Order is cancelled but the invoice was generated and confirmed to customer.

-0.5 Missing message flow. Also it is weird that only here user can request cancel. Why not during Filament swapping?

Result: 11 out of 12
