# Tableaux

# Tableau Proofs

For simplicity: first-order logic **without equality**

**Statements**  $\varphi$  true or  $\varphi$  false

**Rule**

**Interpretation**

If  $\varphi \sigma$  is **possible** then so is  $\psi_i \tau_i, \dots, \vartheta_i u_i$ , for some  $i$ .

# Tableaux

## Construction

A **tableau** for a formula  $\varphi$  is constructed as follows:

- ▶ start with  $\varphi$  **false**
- ▶ choose a branch of the tree
- ▶ choose a statement  $\psi$  **value** on the branch
- ▶ choose a rule with head  $\psi$  **value**
- ▶ add it at the bottom of the branch
- ▶ repeat until every branch contains both statements  $\psi$  **true** and  $\psi$  **false** for some formula  $\psi$

$\neg\varphi$  true

$\varphi$  false

$\neg\varphi$  false

$\varphi$  true

$\varphi \wedge \psi$  true

$\varphi$  true

$\psi$  true

$\varphi \wedge \psi$  false

$\varphi$  false

$\psi$  false

$\varphi \vee \psi$  true

$\varphi$  true

$\psi$  true

$\varphi \vee \psi$  false

$\varphi$  false

$\psi$  false

$\varphi \rightarrow \psi$  true

$\varphi$  false

$\psi$  true

$\varphi \rightarrow \psi$  false

$\varphi$  true

$\psi$  false

$\varphi \leftrightarrow \psi$  true

$\varphi$  true

$\varphi$  false

$\psi$  true

$\psi$  false

$\varphi \leftrightarrow \psi$  false

$\varphi$  true

$\varphi$  false

$\psi$  false

$\psi$  true

$\forall x\varphi$  true

$\varphi[x \mapsto t]$  true

$\forall x\varphi$  false

$\varphi[x \mapsto c]$  false

$\exists x\varphi$  true

$\varphi[x \mapsto c]$  true

$\exists x\varphi$  false

$\varphi[x \mapsto t]$  false

$c$  a new constant symbol,  $t$  an arbitrary term

# Example

$(A \vee B) \rightarrow \neg(\neg A \wedge \neg B)$  false

$\neg(\neg A \wedge \neg B) \rightarrow (A \vee B)$  false

# Example

$(A \vee B) \rightarrow \neg(\neg A \wedge \neg B)$  false

$\neg(\neg A \wedge \neg B) \rightarrow (A \vee B)$  false

# Example

$\exists x \forall y R(x, y) \rightarrow \forall y \exists x R(x, y)$  false

$\forall x R(x, x) \rightarrow \forall x \exists y R(f(x), y)$  false

# Example

$\exists x \forall y R(x, y) \rightarrow \forall y \exists x R(x, y)$  false

$\exists x \forall y R(x, y)$  true

$\forall y \exists x R(x, y)$  false

$\forall y R(c, y)$  true

$\exists x R(x, d)$  false

$R(c, d)$  true

$R(c, d)$  false

$\forall x R(x, x) \rightarrow \forall x \exists y R(f(x), y)$  false

$\forall x R(x, x)$  true

$\forall x \exists y R(f(x), y)$  false

$\exists y R(f(c), y)$  false

$R(f(c), f(c))$  false

$R(f(c), f(c))$  true

# Soundness and Completeness

## Theorem

A first-order formula  $\varphi$  is valid if, and only if, there exists a tableau  $T$  for  $\varphi$  false where every branch is contradictory.

# Soundness and Completeness

## Theorem

A first-order formula  $\varphi$  is valid if, and only if, there exists a tableau  $T$  for  $\varphi$  false where every branch is contradictory.

## Corollary

Validity of first-order formulae is **recursively enumerable**, but **not decidable**.

# Soundness and Completeness

## Theorem

A first-order formula  $\varphi$  is valid if, and only if, there exists a tableau  $T$  for  $\varphi$  **false** where every branch is contradictory.

## Terminology

A tableau **for** a statement  $\varphi$  **value** is a tableau  $T$  where the root is labelled with  $\varphi$  **value**.

A branch  $\beta$  is **contradictory** if it contains both statements  $\psi$  **true** and  $\psi$  **false**, for some formula  $\psi$ .

A branch  $\beta$  is **consistent with** a structure  $\mathfrak{A}$  if

- ▶  $\mathfrak{A} \models \psi$ , for all statements  $\psi$  **true** on  $\beta$  and
- ▶  $\mathfrak{A} \not\models \psi$ , for all statements  $\psi$  **false** on  $\beta$ .

A branch  $\beta$  is **complete** if, for every atomic formula  $\psi$ , it contains one of the statements  $\psi$  **true** or  $\psi$  **false**.

# Proof Sketch: Soundness

## Lemma

If  $\beta$  is consistent with  $\mathcal{A}$  and we extend the tableau by applying a rule, the new tableau has a branch  $\beta'$  extending  $\beta$  that is consistent with  $\mathcal{A}$ .

## Corollary

If  $\mathcal{A} \neq \varphi$ , then every tableau for  $\varphi$  false has a branch that is not contradictory.

## Corollary

If  $\varphi$  is not valid, there is no tableau for  $\varphi$  false where all branches are contradictory.

# Proof Sketch: Completeness

## Lemma

If every tableau for  $\varphi$  false has a non-contradictory branch, there exists a tableau for  $\varphi$  false with a branch  $\beta$  that is complete and non-contradictory.

## Lemma

If a branch  $\beta$  is complete and non-contradictory, there exists a structure  $\mathfrak{A}$  such that  $\beta$  is consistent with  $\mathfrak{A}$ .

## Corollary

If every tableau for  $\varphi$  false has a non-contradictory branch, there exists a structure  $\mathfrak{A}$  with  $\mathfrak{A} \models \varphi$ .

# Natural Deduction

# Proof Calculi

## Notation

$\psi_1, \dots, \psi_n \vdash \varphi$     $\varphi$  is **provable** with **assumptions**  $\psi_1, \dots, \psi_n$

# Proof Calculi

## Notation

$\psi_1, \dots, \psi_n \vdash \varphi$     $\varphi$  is **provable** with **assumptions**  $\psi_1, \dots, \psi_n$

$\varphi$  is **provable** if  $\vdash \varphi$ .

# Proof Calculi

## Notation

$\psi_1, \dots, \psi_n \vdash \varphi$   $\varphi$  is **provable** with **assumptions**  $\psi_1, \dots, \psi_n$

$\varphi$  is **provable** if  $\vdash \varphi$ .

## Rules

$$\frac{\Gamma_1 \vdash \varphi_1 \dots \Gamma_n \vdash \varphi_n}{\Delta \vdash \psi} \quad \begin{array}{l} \text{premises} \\ \text{conclusion} \end{array} \quad \varphi_1 \wedge \dots \wedge \varphi_n \Rightarrow \psi$$

# Proof Calculi

## Notation

$\psi_1, \dots, \psi_n \vdash \varphi$   $\varphi$  is **provable** with **assumptions**  $\psi_1, \dots, \psi_n$

$\varphi$  is **provable** if  $\vdash \varphi$ .

## Rules

$$\frac{\Gamma_1 \vdash \varphi_1 \dots \Gamma_n \vdash \varphi_n}{\Delta \vdash \psi} \quad \begin{array}{l} \text{premises} \\ \text{conclusion} \end{array} \quad \varphi_1 \wedge \dots \wedge \varphi_n \Rightarrow \psi$$

## Axiom

$$\frac{}{\Delta \vdash \psi} \quad \text{rule without premises}$$

# Proof Calculi

## Notation

$\psi_1, \dots, \psi_n \vdash \varphi$   $\varphi$  is **provable** with **assumptions**  $\psi_1, \dots, \psi_n$

$\varphi$  is **provable** if  $\vdash \varphi$ .

## Rules

$$\frac{\Gamma_1 \vdash \varphi_1 \dots \Gamma_n \vdash \varphi_n}{\Delta \vdash \psi} \quad \begin{array}{l} \text{premises} \\ \text{conclusion} \end{array} \quad \varphi_1 \wedge \dots \wedge \varphi_n \Rightarrow \psi$$

## Axiom

$$\frac{}{\Delta \vdash \psi} \quad \text{rule without premises}$$

## Remark

Tableaux speak about **possibilities** while Natural Deduction proofs speak about **necessities**.

# Proof Calculi

## Derivation

$$\frac{\frac{\overline{\Gamma \vdash \varphi} \quad \overline{\Delta_0 \vdash \psi_0}}{\Delta_1 \vdash \psi_1} \quad \overline{\Gamma' \vdash \varphi'}}{\Sigma \vdash \vartheta}$$

# Soundness and Completeness

## Theorem

A formula  $\varphi$  is provable using Natural Deduction if, and only if, it is valid.

## Corollary

The set of valid first-order formulae is recursively enumerable.

**Isabelle/HOL**

# Isabelle/HOL

Proof assistant designed for software verification.

## General structure

```
theory T
imports T1 ... Tn
begin
  declarations, definitions, and proofs
end
```

# Syntax

Two levels:

- ▶ the **meta-language** (Isabelle) used to define theories,
- ▶ the **logical language** (HOL) used to write formulae.

To distinguish the levels, one encloses formulae of the logical language in quotes.

```
datatype 'a list = Nil                ("[]")  
                | Cons 'a "'a list"  (infixr "#" 65)
```

```
primrec app :: "'a list => 'a list => 'a list"  
          (infixr "@" 65)
```

**where**

```
"[] @ ys      = ys" |  
"(x # xs) @ ys = x # (xs @ ys)"
```

# Logical Language

## Types

# Nonmonotonic Logic

# Negation as Failure

## Goal

Develop a proof calculus supporting Negation as Failure as used in Prolog.

## Monotonicity

Ordinary deduction is **monotone**: if we add new assumption, all consequences we have already derived remain. More information does not invalidate already made deductions.

## Non-Monotonicity

Negation as Failure is **non-monotone**:

$P$  implies  $\neg Q$  but  $P, Q$  does not imply  $\neg Q$ .

# Default Logic

## Rule

$$\frac{\alpha_0 \dots \alpha_m : \beta_0 \dots \beta_n}{\gamma}$$

$\alpha_i$  assumptions  
 $\beta_i$  restraints  
 $\gamma$  consequence

Derive  $\gamma$  provided that we can derive  $\alpha_0, \dots, \alpha_m$ , but none of  $\beta_0, \dots, \beta_n$ .

## Example

$$\frac{\text{bird}(x) : \text{penguin}(x) \text{ ostrich}(x)}{\text{can\_fly}(x)}$$

# Semantics

## Definition

A set  $\Phi$  of formulae is **consistent** with respect to a set of rules  $R$  if, for every rule

$$\frac{\alpha_0 \dots \alpha_m : \beta_0 \dots \beta_n}{\gamma} \in R$$

such that  $\alpha_0, \dots, \alpha_m \in \Phi$  and  $\beta_0, \dots, \beta_n \notin \Phi$ , we have  $\gamma \in \Phi$ .

## Note

If there are no restraints  $\beta_i$ , consistent sets are **closed under intersection**.

$\Rightarrow$  There is a unique smallest such set, that of all **provable** formulae.

If there are restraints, this may not be the case. Formulae that belong to all consistent sets are called **secured consequences**.

# Examples

The system

$$\frac{}{\alpha} \quad \frac{\alpha : \beta}{\beta}$$

has a unique consistent set  $\{\alpha, \beta\}$ .

The system

$$\frac{}{\alpha} \quad \frac{\alpha : \beta}{\gamma} \quad \frac{\alpha : \gamma}{\beta}$$

has consistent sets

$$\{\alpha, \beta\}, \quad \{\alpha, \gamma\}, \quad \{\alpha, \beta, \gamma\}.$$
