

# **ANALYSIS OF RESOLUTION PROOFS (CURRENT STATE)**

**Karel Vaculík**

**IA008 Computational Logic**

# INTRODUCTION

Načítať formulu

Pridať klauzulu

Vytvoriť čiaru

Odstrániť

Znovu vybrať typ rezolúcie a klauzúl

Vložiť spor

Vložiť nekonečno ∞

Rozšíriť klauzulu

Uložiť a ukončiť

Help

Znak pre negáciu sa vkladá znakom "-"

Rozhodnite, či nasledujúca množina klauzúl je splniteľná prostredníctvom rezolúcie:  $\{ [-A, -B], [A, -C], [B, -A], [C, -B] \}$  použite SLD rezolúciu (Selective Linear Definite)

Zvolil si SLD rezolúcia (Selective Linear Definite Res.)

```
graph TD; N1["[-A, -B]"] --- N2["[-C, -B]"]; N3["[A, -C]"] --- N2; N2 --- N4["[-B, -B]"]; N3 --- N5["[C, -B]"]; N4 --- N6["[]"]; N5 --- N6;
```

# DATA SOURCES

- Spring 2013: IB101 Introduction to Logic  
~ 400 students
- Fall 2013: IA008 Computational Logic  
~ 65 students

# CURRENT STATE OF ANALYSIS

- General overview
- Graph mining

(Use of time component in future work)

# GENERAL OVERVIEW

# GENERAL OVERVIEW

- Summary of entities:

	GRAPHS	NODES*	EDGES*
SPRING	1385	13259	11709
FALL	410	4213	3764
TOTAL	1795	17472	15473

\*without deleted nodes and edges

# GENERAL OVERVIEW

## ○ Errors

- Simple scripts for finding errors

1	Zle priradený typ klauzúl k typu rezolúcie
2	Chýba druhý rodič
3	Rezolvovanie na dvoch literáloch súčasne (nebo i na více literáloch)
4	Opakovanie rovnakého literálu v množine
5	Rezolvovanie na rovnakom literály
6	Preklep, alebo vlastné literály
7	Rezolvovanie v rámci jednej klauzuly
8	Žiadna rezolúcia iba spojenie množín

# GENERAL OVERVIEW

- Errors
  - Simple scripts for finding errors

	COUNT	% OF GRAPHS
SPRING	321	16.10
FALL	66	23.18
TOTAL	387	21.56

## SPRING 2013: error distribution

## FALL 2013: error distribution

1	Zle priradený typ klauzúl k typu rezolúcie
2	Chýba druhý rodič
3	Rezolvovanie na dvoch literáloch súčasne (nebo i na více literáloch)
4	Opakovanie rovnakého literálu v množine
5	Rezolvovanie na rovnakom literály
6	Preklep, alebo vlastné literály
7	Rezolvovanie v rámci jednej klauzuly
8	Žiadna rezolúcia iba spojenie množín

\*Each error type counted in graph only once

# GRAPH MINING

# GRAPH MINING – INTRODUCTION

- Typical data structure for learning algorithms:

attribute 1	Attribute 2	...	Attribute n	Class
val 11	val 12	...	val 1n	class i1
...	...	...	...	...
val m1	val m2	...	val mn	class im

- Resolution proofs:

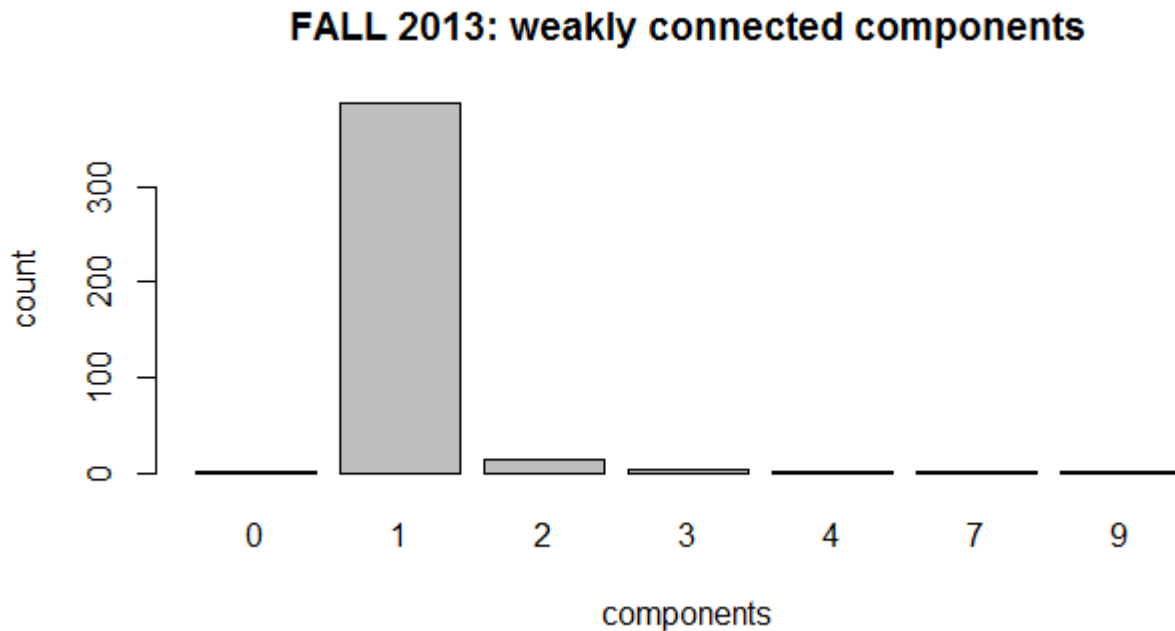

# PREPROCESSING

- Create graphs from tables with nodes and edges
- Replace malformed nodes with “unallowed”

# PREPROCESSING

- Weakly connected components:

# PREPROCESSING

- Keep graphs with 1 component
- Keep only binary trees
- New summary:

	BINARY TREES	ORIG. GRAPHS
SPRING	1130	1385
FALL	336	410
TOTAL	1466	1795

# PREPROCESSING

- Append to each tree:
  - List of errors
  - Correctness flag (no error)
  - Question type (SLD, linear, general, ...)
  - Used clause type (set, ordered list)

# CLASSIFICATION

- Using updated application from VACULÍK, Karel. Dolování z grafů pro podporu výuky [online]. 2013 [cit. 2013-11-27]. Diplomová práce. Masarykova univerzita, Fakulta informatiky.
- New data structure for learning algorithms:

<b>pattern 1</b>	<b>pattern 2</b>	<b>...</b>	<b>pattern m</b>	<b>Addit. attr. 1</b>	<b>...</b>	<b>Addit. attr. k</b>	<b>Class</b>
true	false	...	false	Val 11	...	Val 1k	class i1
...	...	...	...	...	...	...	...
false	true	...	true	Val mn	...	Val mk	class im

# CLASSIFICATION

- Patterns – two approaches:
  - Frequent subgraphs
  - Generalized subgraphs

# FREQUENT SUBGRAPHS

- Algorithm for frequent subgraph mining
- Specifically, mining from unordered rooted trees
- Given the minimum support, find all frequent subtrees in a set of trees
- Example (min. sup. 25%):

- Application employs Sleuth algorithm (Mohammed J. Zaki, Efficiently Mining Frequent Embedded Unordered Trees. *Fundamenta Informaticae*, 66(1-2):33-52. Mar/Apr 2005.)

# GENERALIZED SUBGRAPHS

- Find all 3-node subgraphs representing the resolution step
- Generalize found subtrees and merge them

- Filter out infrequent subtrees

# EXPERIMENTS

- All binary trees (1466)
- Classes:
  - Incorrect proof (187)
  - Correct proof (1279)
- Additional attributes:
  - Clause type (set, ordered list)
  - Resolution type (SLD, linear, general, ...)
- Generalized patterns (min support 0%)
- Oversampling

# EXPERIMENTS

- Classification algorithms
  - J48
  - Naive Bayes
  - SMO
  - IBk
- Evaluation: 10-fold cross validation
- Best result so far:
  - J48
  - Accuracy: 96.9%

# FUTURE WORK

- Additional analyses
- Other graph representations
- Sequence mining
