

## Requirements Engineering

Lecture 2

## Requirements engineering

- ♦ The process of establishing the services that the customer requires from a system and the constraints under which it operates and is developed.
- ♦ The requirements themselves are the descriptions of the system services and constraints that are generated during the requirements engineering process.
  - It may range from a high-level abstract statement of a service or of a system constraint to a detailed mathematical functional specification.

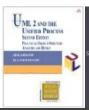

#### **Outline**

- ♦ Requirements and their types
- ♦ Requirements engineering process
  - Requirements elicitation and analysis
  - Requirements validation
  - Requirements management
- ♦ UML Use Case diagram

## **Requirements and their Types**

Lecture 2/Part 1

## Types of requirements

## ♦ User requirements

- Statements in natural language plus diagrams of the services the system provides and its operational constraints.
- For client managers, client engineers and system architects.

## ♦ System requirements

- A structured document setting out detailed descriptions of the system's functions, services and operational constraints. Defines what should be implemented.
- For client engineers, system architects and system developers.

#### ♦ Which of them are more abstract/concrete?

## **User and system requirements**

#### User requirement definition

 The MHC-PMS shall generate monthly management reports showing the cost of drugs prescribed by each clinic during that month.

#### System requirements specification

- 1.1 On the last working day of each month, a summary of the drugs prescribed, their cost and the prescribing clinics shall be generated.
- 1.2 The system shall automatically generate the report for printing after 17.30 on the last working day of the month.
- 1.3 A report shall be created for each clinic and shall list the individual drug names, the total number of prescriptions, the number of doses prescribed and the total cost of the prescribed drugs.
- 1.4 If drugs are available in different dose units (e.g. 10mg, 20 mg, etc.) separate reports shall be created for each dose unit.
- 1.5 Access to all cost reports shall be restricted to authorized users listed on a management access control list.

## Functional and non-functional requirements

- ♦ Functional requirements
  - Statements of services the system should provide, how the system should react to particular inputs and how the system should behave in particular situations.
  - E.g. A user shall be able to search the appointments lists for all clinics.
- ♦ Non-functional requirements
  - Properties and constraints on the services offered by the system such as timing, reliability and security constraints, constraints on the development process, platform, standards, etc.
  - E.g. The system shall be available on Mon–Fri, 8 am 5 pm, with downtime not exceeding five seconds in any one day.
- ♦ Can you think of more examples of the two types?

# Requirements precision, completeness and consistency

#### ♦ Precise

 They should have just one interpretation in the system context, which is enforced by the following two properties.

## ♦ Complete

They should include descriptions of all facilities required.

### ♦ Consistent

- There should be no conflicts or contradictions in the descriptions of the system facilities.
- In practice, it is very hard (sometimes impossible) to produce a complete and consistent requirements document.

## **Key points**

- ♦ Requirements for a software system set out what the system should do and define constraints on its operation and implementation.
- ♦ Functional requirements are statements of the services that the system must provide or are descriptions of how some computations must be carried out.
- Non-functional requirements often constrain the system being developed and the development process being used.

## **Requirements Engineering Process**

Lecture 2/Part 2

### **Outline**

- ♦ Requirements elicitation and analysis
- ♦ Requirements validation
- ♦ Requirements management

## Requirements engineering processes

- ♦ The processes used for RE vary widely depending on the application domain, the people involved and the organisation developing the requirements.
- However, there are a number of generic activities common to all processes
  - Requirements elicitation and analysis;
  - Requirements validation;
  - Requirements management.
- ♦ In practice, RE is an iterative activity in which these processes are interleaved.
- ♦ Is there a relation to Boehm's model from Lecture 1?

## Requirements elicitation and analysis

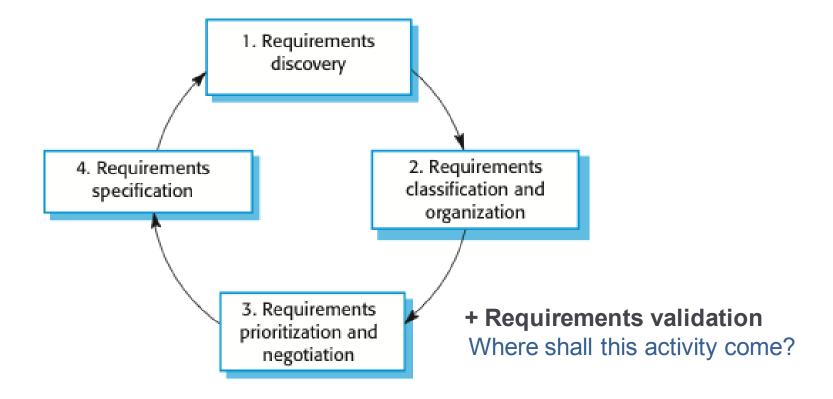

- ♦ Software engineers work with system stakeholders:
  - end-users, managers, maintenance engineers, domain experts, trade unions, etc.
- ♦ To find out about:
  - the application domain,
  - the services that the system should provide,
  - the required system performance,
  - hardware constraints,
  - other systems, etc.
- ♦ As far as possible, it should set of WHAT the system should do rather than HOW it will do (implement) it.

## The requirements elicitation and analysis process

#### **Process activities**

- ♦ Requirements discovery
  - Interacting with stakeholders and studying existing processes and needs to discover their requirements.
- Requirements classification and organisation
  - Groups related requirements and organises them into clusters.
- ♦ Prioritisation and negotiation
  - Prioritising requirements and resolving requirements conflicts.
- ♦ Requirements specification
  - Requirements are documented and input into the next round of the spiral.
- ♦ Requirements validation

## Requirements discovery

- ♦ Questionnaires
- ♦ Interviews
  - Small number of software engineers and stakeholders
- ♦ Workshops
  - Large group of interested parties; free brainstorming
- ♦ Ethnography
  - Observe existing processes
- ♦ Is there a recommended order if the techniques shall be combined?

## Interviews and workshops

- ♦ Formal or informal interviews with stakeholders are part of most RE processes.
- ♦ Types of interview
  - Closed interviews based on pre-determined list of questions
  - Open interviews where various issues are explored
  - Workshops with brainstorming of all involved stakeholders
- ♦ Effective interviewing
  - Be open-minded, avoid pre-conceived ideas about the requirements and are willing to listen to stakeholders.
  - Prompt the interviewee to get discussions going using a springboard question, a requirements proposal, or by working together on a prototype system.

## **Ethnography**

- A social scientist spends a considerable time observing and analysing how people actually work.
- ♦ People do not have to explain or articulate their work.
- ♦ Social and organisational factors of importance may be observed.
- Ethnographic studies have shown that work is usually richer and more complex than suggested by simple system models.

# Requirements classification and prioritisation

#### ♦ MoSCoW criteria

- Must have mandatory requirement fundamental to the system
- Should have important requirement that may be omitted
- Could have truly optional requirement
- Want to have requirement that can wait for later releases

#### ♦ RUP attributes

- Status Proposed/Approved/Rejected/Incorporated
- Benefit Critical/Important/Useful
- Effort number of person days/functional points/etc.
- Risk High/Medium/Low
- Stability High/Medium/Low
- Target Release future product version

## Requirements specification

Notation	Description
Natural language	Numbered sentences in natural language, each sentence expressing one requirement. E.g. Project assignment.
Structured natural language	The requirements are written in natural language on a standard form or template. Each field provides information about an aspect of the requirement. <i>E.g. Textual specification of UML use cases.</i>
Design description languages	This approach uses a language like a programming language, but with more abstract features to specify the requirements by defining an operational model of the system. <i>E.g. Main flow in the UML UC textual specification</i> .
Graphical notations	Graphical models, supplemented by text annotations, are used to define the functional requirements for the system. <i>E.g. UML use case and activity diagrams</i> .
Mathematical specifications	Notations based on mathematical concepts; <i>E.g. finite-state machines or sets</i> . Although they can reduce the ambiguity in a requirements document, most customers don't understand them and are reluctant to accept it as a system contract

## ♦ When shall we choose mathematical specification?

## Requirements validation

- ♦ Concerned with demonstrating that the requirements define the system that the customer really wants.
- Requirements error costs are high so validation is very important
  - Fixing a requirements error after delivery may cost up to 100 times the cost of fixing an implementation error.

## Requirements validation

Are there any requirements conflicts?

## ♦ Completeness

Are all functions required by the customer included?

#### ♦ Realism

 Can the requirements be implemented given available budget and technology

## ♦ Verifiability

Can the requirements be checked?

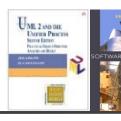

#### Additional validation criteria

- ♦ Comprehensibility
  - Is the requirement properly understood?
- ♦ Traceability
  - Is the origin of the requirement clearly stated?
- - Can the requirement be changed without a large impact on other requirements?

## Requirements validation techniques

- Systematic manual analysis of the requirements.
- Both client and contractor staff should be involved.
- Reviews may be formal (with completed documents) or informal (relying on good communications between developers, customers and users).

## ♦ Prototyping

Using an executable model of the system to check requirements.

## ♦ Test-case generation

Developing tests for requirements to check testability.

## Requirements management

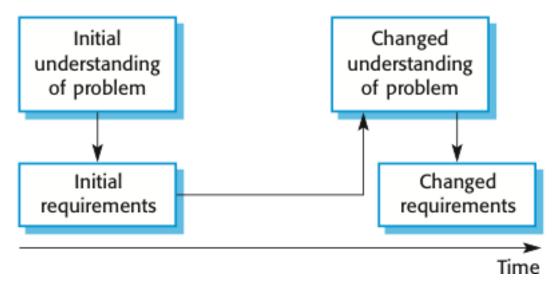

- Requirements management is the process of managing changing requirements during the requirements engineering process and system development.
- ♦ New requirements emerge as a system is being developed and tested by the users. Some due to business, organizational and technical changes.
- Traceability and maintenance of links between dependent requirements is important to assess the impact of requirements changes.
- We need a formal process for making change proposals and linking these to system requirements.

### Requirements evolution

- ♦ Each requirements change should be analysed before deciding whether to accept it.
  - Analyse the problem, check the validity of the change proposal
  - Asses the effects of the change, via traceability information
  - Integrate the change in the specification documents

## **Key points**

- ♦ You can use a range of techniques for requirements elicitation including interviews and ethnography.
- Requirements validation is the process of checking the requirements for validity, consistency, completeness, realism and verifiability.
- Business, organizational and technical changes inevitably lead to changes to the requirements for a software system.
- ♦ Requirements management is the process of managing and controlling these changes.

## **UML Use Case Diagram**

Lecture 2/Part 3

#### **Outline**

- ♦ Use Case modelling
  - System boundary subject
  - Use cases
  - Actors
- ♦ Textual Use Case specification
- ♦ Advanced Use Case modelling
  - Actor generalisation
  - Use case generalisation
  - «include»
  - «extend»

## The purpose of Use Case modelling

- Use case modelling is a form of requirements engineering
- ♦ Use case modelling proceeds as follows:
  - Find the system boundary
  - Find actors
  - Find use cases
    - Use case specification
    - Scenarios
- ♦ It lets us identify the system boundary, who or what uses the system, and what functions the system should offer

## The subject

- ♦ Before we can build anything, we need to know:
  - Where the **boundary** of the system lies
  - Who or what uses the system
  - What functions the system should offer to its users
- ♦ We create a Use Case model containing:
  - Subject the edge of the system
    - also known as the system boundary
  - Actors who or what uses the system
  - Use Cases things actors do with the system
  - Relationships between actors and use cases

subject

SystemName

♦ Can there be a direct relationship between actors?

#### What are actors?

- An actor is anything that interacts directly with the system
  - Actors identify who or what uses the system and so indicate where the system boundary lies

«actor»
Customer

- Actors are external to the system
- An Actor specifies a *role* that some external entity adopts when interacting with the system
  - Can one actor represent two physical persons?
  - Can one physical person match to two actors?
  - Can there be two actors with the same name in the model?

## **Identifying Actors (for seminars)**

- ♦ When identifying actors ask:
  - Who or what uses the system?
  - What roles do they play in the interaction?
  - Who installs the system?
  - Who starts and shuts down the system?
  - Who maintains the system?
  - What other systems use this system?
  - Who gets and provides information to the system?
  - Does anything happen at a fixed time?

#### What are use cases?

- ♦ A use case is something an actor needs the system to do. It is a "case of use" of the system by a specific actor
- ♦ Use cases are always started by an actor
  - The *primary actor* triggers the use case
  - Zero or more secondary actors interact with the use case in some way
  - Does the UC diagram tell me which actor is primary/secondary?
- ♦ Use cases are always written from the point of view of the actors

**PlaceOrder** 

GetStatusOnOrder

## Identifying use cases (for seminars)

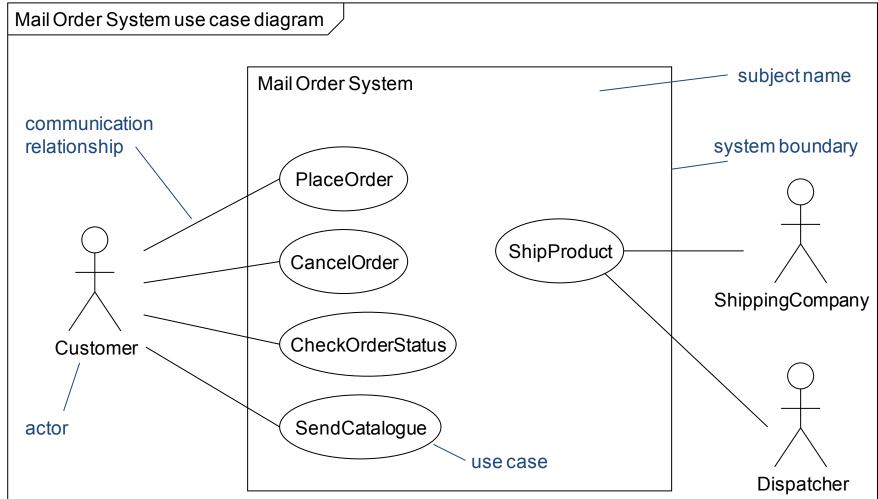

- ♦ Start with the list of actors that interact with the system
- ♦ When identifying use cases ask:
  - What functions will a specific actor want from the system?
  - Does the system store and retrieve information? If so, which actors trigger this behaviour?
  - What happens when the system changes state (e.g. system start and stop)? Are any actors notified?
  - Are there any external events that affect the system? What notifies the system about those events?
  - Does the system interact with any external system?
  - Does the system generate any reports?

## The use case diagram

## Textual use case specification

use case name

use case identifier

brief description

the actors involved in the use case

the system state before the use case can begin

the actual steps of the use case

the system state when the use case has finished alternative flows

Use case: PaySalesTax

ID: 1

Brief description:

Pay Sales Tax to the Tax Authority at the end of the business quarter.

Primary actors:

Time

Secondary actors:

**TaxAuthority** 

Preconditions:

1. It is the end of the business quarter.

Main flow:

implicit time actor

- 1. The use case starts when it is the end of the business quarter.
- 2. The system determines the amount of Sales Tax owed to the Tax Authority.
- 3. The system sends an electronic payment to the Tax Authority.

Postconditions:

1. The Tax Authority receives the correct amount of Sales Tax.

Alternative flows:

None.

# Naming use cases

- ♦ Use cases describe something that happens
- ♦ They are named using verbs or verb phrases
- ♦ Naming standard ¹: use cases are named using UpperCamelCase e.g. PaySalesTax

1 UML 2 does not specify *any* naming standards. All naming standards here are based on industry best practice.

## Pre and postconditions

- Preconditions and postconditions are constraints
- Preconditions constrain the state of the system *before* the use case can start
- Postconditions constrain the state of the system after the use case has executed
- What pre/postconditions does a delete of a product have?
- What about if the deletion is not successful?

Use case: PlaceOrder

### Preconditions:

1. A valid user has logged on to the system

### Postconditions:

1. The order has been marked confirmed and is saved by the system

### Main flow

### <number> The <something> <some action>

- ♦ The flow of events lists the steps in a use case
- ♦ It always begins by an actor doing something
  - A good way to start a flow of events is:
    - 1) The use case starts when an <actor> <function>
- ♦ The flow of events should be a sequence of short steps that are:
  - Declarative
  - Numbered,
  - Time ordered
- ♦ The main flow is always the happy day scenario
  - Everything goes as expected, without errors, deviations and interrupts
  - Alternatives can be shown by branching or by listing under Alternative flows (see later)

# Branching within a flow: IF

- Use the keyword IF to indicate alternatives within the flow of events
  - There must be a Boolean expression immediately after IF
- Use indentation and numbering to indicate the conditional part of the flow
- Use ELSE to indicate what happens if the condition is false

Use case: ManageBasket

ID: 2

Brief description:

The Customer changes the quantity of an item in the basket.

Primary actors:

Customer

Secondary actors:

None.

Preconditions:

1. The shopping basket contents are visible.

Main flow.

- The use case starts when the Customer selects an item in the basket.
- 2. IF the Customer selects "delete item"
  - 2.1 The system removes the item from the basket.
- 3. IF the Customer types in a new quantity
  - 3.1 The system updates the quantity of the item in the basket.

Postconditions:

None.

Alternative flows:

None.

## Repetition within a flow: FOR

- We can use the keyword FOR to indicate the start of a repetition within the flow of events
- The iteration expression immediately after the FOR statement indicates the number of repetitions of the indented text beneath the FOR statement.

#### Use case: FindProduct

ID: 3

### Brief description:

The system finds some products based on Customer search criteria and displays them to the Customer.

#### Actors:

Customer

#### Preconditions:

None.

#### Main flow:

- 1. The use case starts when the Customer selects "find product".
- 2. The system asks the Customer for search criteria.
- 3. The Customer enters the requested criteria.
- 4. The system searches for products that match the Customer's criteria.
- 5. FOR each product found
  - 5.1. The system displays a thumbnail sketch of the product.
  - 5.2. The system displays a summary of the product details.
  - 5.3. The system displays the product price.

#### Postconditions:

None.

#### Alternative flows:

NoProductsFound

### Repetition within a flow: WHILE

We can use the keyword WHILE to indicate that something repeats while some Boolean condition is true

Use case: ShowCompanyDetails

ID: 4

Brief description:

The system displays the company details to the Customer.

Primary actors:

Customer

Secondary actors:

None

Preconditions:

None.

#### Main flow:

- 1. The use case starts when the Customer selects "show company details".
- 2. The system displays a web page showing the company details.
- 3. WHILE the Customer is browsing the company details
- 4. The system searches for products that match the Customer's criteria.
  - 4.1. The system plays some background music.
  - 4.2. The system displays special offers in a banner ad.

#### Postconditions:

- 1. The system has displayed the company details.
- 2. The system has played some background music.
- 3. The systems has displayed special offers.

Alternative flows:

None.

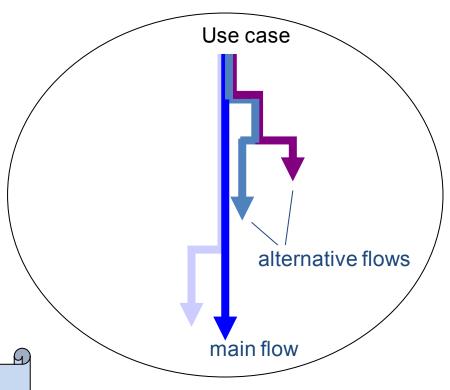

# **Branching: Alternative flows**

- Alternative flows capture errors, branches, and interrupts
- They can often be triggered at any time during the main flow
- ♦ Alternative flows never return to the main flow

Only document enough alternative flows to clarify the requirements!

## Referencing alternative flows

- Find alternative flows by examining each step in the main flow and looking for:
  - Alternatives
  - Exceptions
  - Interrupts

Use case: CreateNewCustomerAccount

ID: 5

Brief description:

The system creates a new account for the Customer.

Primary actors:

Customer

Secondary actors:

None.

Preconditions:

None.

#### Main flow:

- 1. The use case begins when the Customer selects "create new customer account".
- 2. WHILE the Customer details are invalid
  - 2.1. The system asks the Customer to enter his or her details comprising email address, password and password again for confirmation.
  - 2.2 The system validates the Customer details.
- 3. The system creates a new account for the Customer.

#### Postconditions:

1. A new account has been created for the Customer.

Alternative flows:

InvalidEmailAddress

InvalidPassword

Cancel

**Alternative** 

flows

## Advanced Use Case modelling

- We have studied basic use case analysis, but there are relationships that we have still to explore:
  - Actor generalisation
  - Use case generalisation
  - «include» between use cases
  - «extend» between use cases

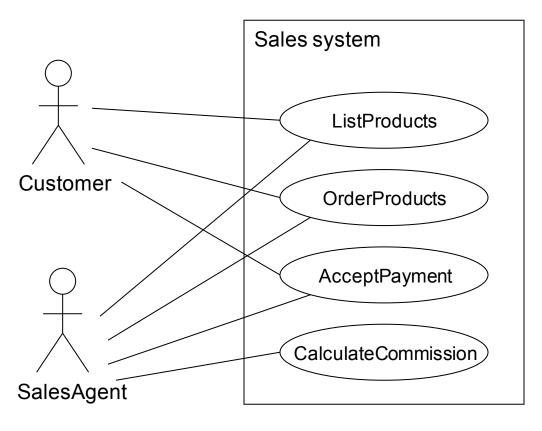

## **Actor generalization - example**

- The Customer and the Sales Agent actors are very similar
- They both interact with List products, Order products, Accept payment
- ↑ They both can play the purchaser role.
- Can we always generalize two actors sharing some use cases?

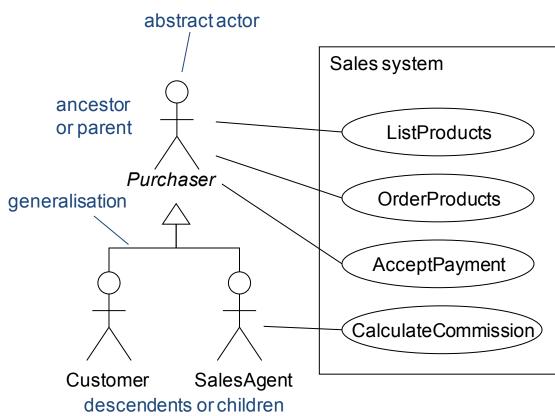

## **Actor generalisation**

- If two actors share the same sub-role, which makes them communicate with the same set of use cases, we can express this as a generalisation to a new (possibly abstract) actor
- The descendent actors inherit the roles and relationships to use cases held by the ancestor actor
- We can substitute a descendent actor anywhere the ancestor actor is expected. This is the substitutability principle

Use actor generalization when it simplifies the model

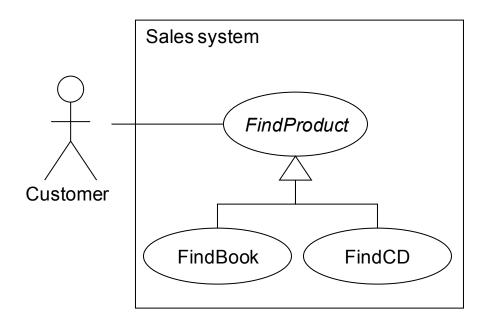

## Use case generalisation

- The ancestor use case must be a more general case of one or more descendant use cases
- Child use cases are more specific forms of their parent
- They can inherit, add and override features of their parent

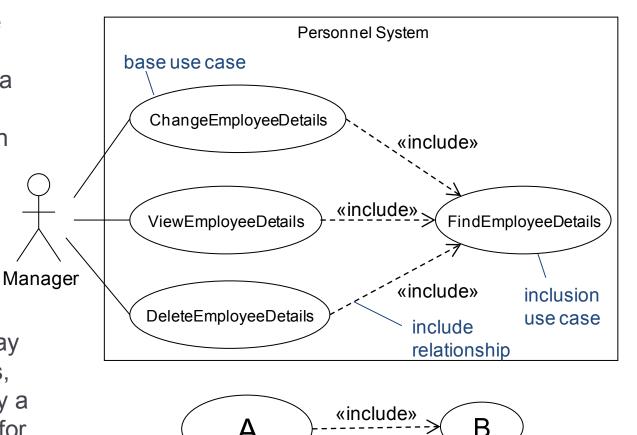

### «include»

- When use cases share common behaviour we can factor this out into a separate inclusion use case and «include» it in base use cases
- Base use cases are not complete without the included use cases
- Inclusion use cases may be complete use cases, or they may just specify a fragment of behaviour for inclusion elsewhere

# «include» example

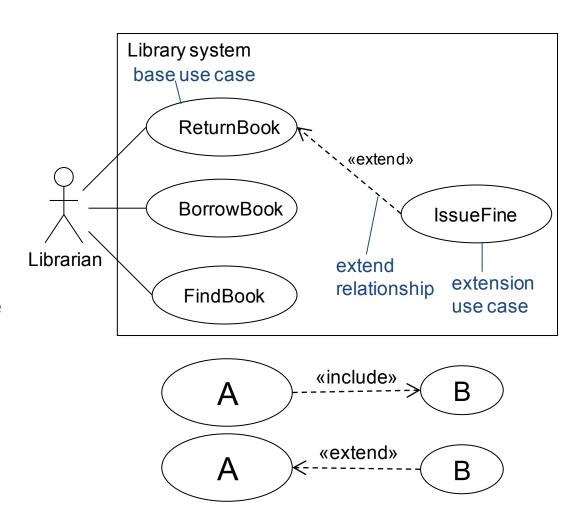

Use case: ChangeEmployeeDetails		<b></b>	Use case: FindEmployeeDetails
ID: 1			ID: 4
Brief description: The Manager changes the employee details.			Brief description: The Manager finds the employee details.
Primary actors: Manager			Primary actors: Manager
Seconday actors: None			Seconday actors: None
Preconditions:  1. The Manager is logged on to the system.			Preconditions: 1. The Manager is logged on to the system.
Main flow: 1. include(FindEmployeeDetails). 2. The system displays the employee details.	<b> </b>	•	Main flow: 1. The Manager enters the employee's ID. 2. The system finds the employee details.
3. The Manager changes the employee details.			Postconditions:  1. The system has found the employee details.
Postconditions:  1. The employee details have been changed.			Alternative flows: None.
Alternative flows: None.			

### «extend»

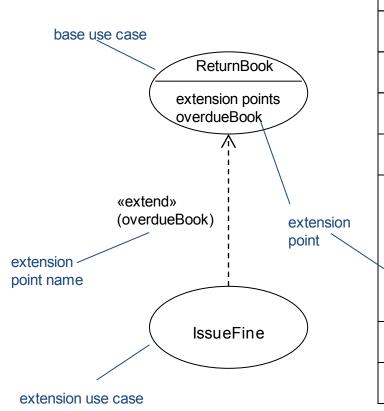

- The extension use case inserts behaviour into the base use case.
- The base use case provides extension points, but does not know about the extensions.
- The base use case is complete already without the extensions.
- There may be multiple extension points and multiple extending use cases.

## <<extend>> example

Use case: ReturnBook

ID: 9

Brief description:

The Librarian returns a borrowed book.

Primary actors:

Librarian

Secondary actors:

None.

Preconditions:

1. The Librarian is logged on to the system.

Main flow:

- 1. The Librarian enters the borrower's ID number.
- 2. The system displays the borrower's details including the list of borrowed books.
- 3. The Librarian finds the book to be returned in the list of books. extension point: overdueBook
- 4. The Librarian returns the book.

..

Postconditions:

1. The book has been returned.

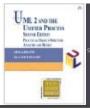

Alternative flows:

None.

Extension points are *not* numbered, as they are *not* part of the flow

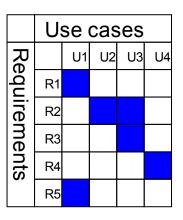

## Requirements tracing

There is a many-to-many relationship between requirements and use cases:

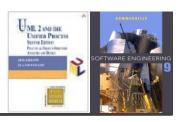

- One use case covers many individual functional requirements
- One functional requirement may be realised by many use cases
- Requirements Traceability matrix can help us to trace if all requirements are covered by our use case model

Requirements Traceability Matrix

# **Key points**

- ♦ Use cases describe system behaviour from the point of view of actors. They are the *best* choice when:
  - The system is dominated by functional requirements
  - The system has many types of user to which it delivers different functionality
  - The system has many interfaces
- ♦ We have discussed:
  - Actors, use cases and their textual specification
  - Actor and use case generalization
  - Advanced relationships between use cases (include and extend)
- Use advanced features with discretion only where they simplify the model!
