## Interaction Diagrams

**Interaction diagrams** model the cooperation of classes/objects/actors for the implementation of use cases (or parts of them).

We distinguish 4 main types, each of which gives a view of a different aspect of the interaction:

- 1. Sekvenčný diagram (sequence diagram) captures the communication between classes/objects with an emphasis on the temporal sequence when passing messages.
- 2. Komunikačný diagram (communication diagram) captures communication with an emphasis on relationships between classes/objects.

## Interaction Diagrams II

- **3.** Časový diagram (timing diagram) model time constraints of the interactions of objects in real time.
- **4.** Diagam prehľadu interakcií (interaction overview diagram) is a special case of activity diagram, which shows a top view of the connections between the complex sub-interactions.

## Sequence diagram

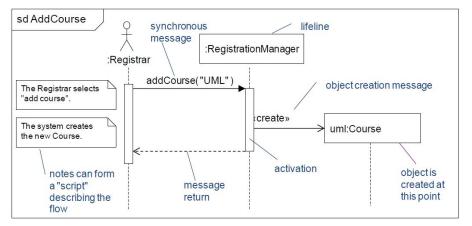

**Sequence diagrams** show the interaction as a time-ordered sequences of messages between objects/classes/actors.

#### **Basic elements:**

- Actors, classes, objects
- Lifelines
- Activations (focus of control)
- Messages
- Combined Fragments

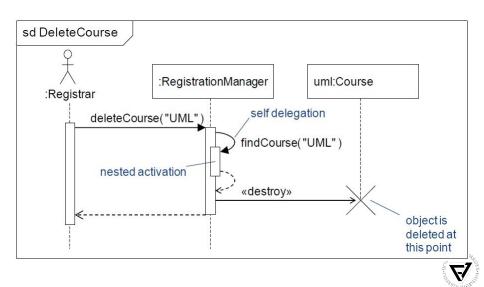

## Sequence diagram - Example

## Sequence diagram - Example II

## Sequence diagram - Combined Fragments

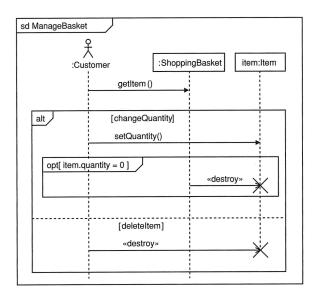

**Combined fragments** divide the sequence diagram in more areas with different behavior.

Each combined fragment is marked with an *operátor*, one or more *operands*, and *condition(s)*.

The most important operators are:

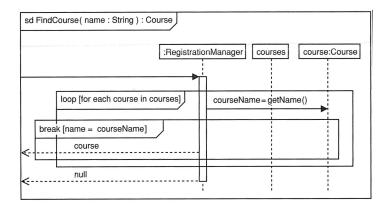

- opt (option) has one operand, which is triggered only if the defined condition is met
- alt (alternatives) the operand whose condition is evaluated to true will be launched.
- loop repeated execution of the operand
- **break** operand is executed if it meets any conditions and terminates, the execution cycle

# Sequence diagram - Combined Fragments II

# Sequence diagram - Combined Fragments III

## Communication Diagram

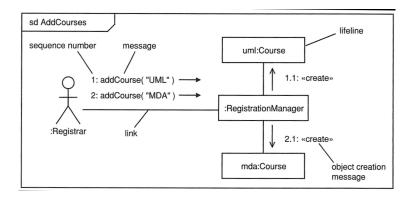

**Communication Diagrams** capture the interactions of objects/classes tjat communicate with each other.

#### The basic elements:

- Actors, classes, objects
- connections (links)
- Messages

## Communication Diagram - Example

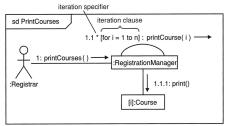

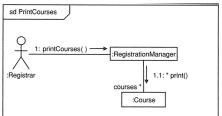

## Communication Diagram - Iterations

**Iterations** are expressed in communication diagram using the iteration expression.

Syntax: \* [loop min, max [condition]]

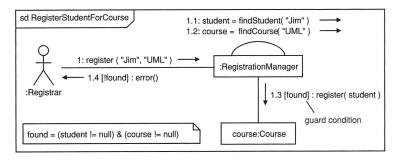

# Communication Diagram - Branching

**Branching** in the communication diagram is obtained by adding guarding conditions to communications. The message is sent only in case that the condition evaluates to true.

### **Tasks**

- Open the use case model and the classes and for each use case look at the objects that are involved in the various functionalities
- Select the 5 most interesting (sufficiently complex) use cases
- Model 2 of them (the simpler ones) by means of a communication diagram
- Model the remaining 3 by means of sequence diagrams
- when modelling the interaction diagrams, update the class diagram with operations that might be necessary
- OPTIONAL TASK: For the next week you can also try to develop a sequence diagram from last year's exam and then get the feedback next time (see IS for Week 10 for the link to the exam paper).
- Upload the PDF report into folder (Week 10).
  Deadline: 07.12.15 23:59 (Groups 2,3)
