

# Decision making methodology and algorithm : AHP (Analytical Hierarchical Process)

Creation of Information Systems on the Basis of Team Work  
Dalia Krikščiūnienė, VU, 2022

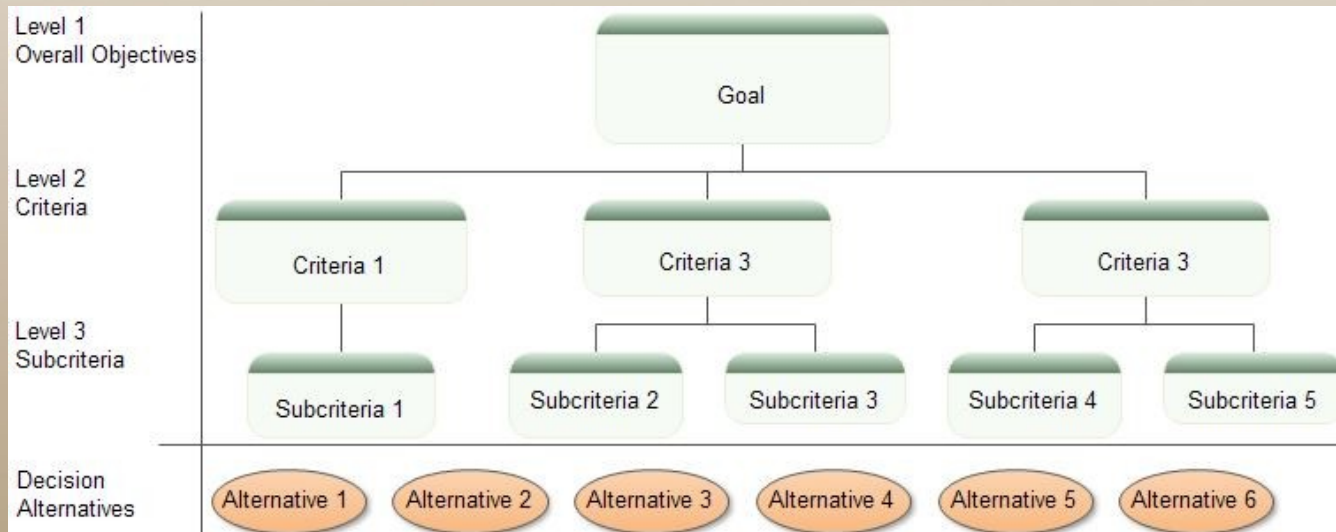

# Analytical Hierarchical process AHP

- Author: Saaty 1980.
- Based on expert evaluation
- Allows expert groups
- Application of quantitative and qualitative criteria
- Process of pairwise evaluation (instead of overall assignment of values)
- Consistency check
- Result – ranking by importance, weights

# AHP algorithm

- Two stage algorithm, where evaluation is done by **pairwise** comparison of all possible pairs of items:
  - Stage 1: Criteria** assessment -weight assignment to the criteria, arranged as a hierarchical tree
  - Stage 2:** Assessment of decision **alternatives** (a list of selected objects- weight assignment by each criterion and globally)

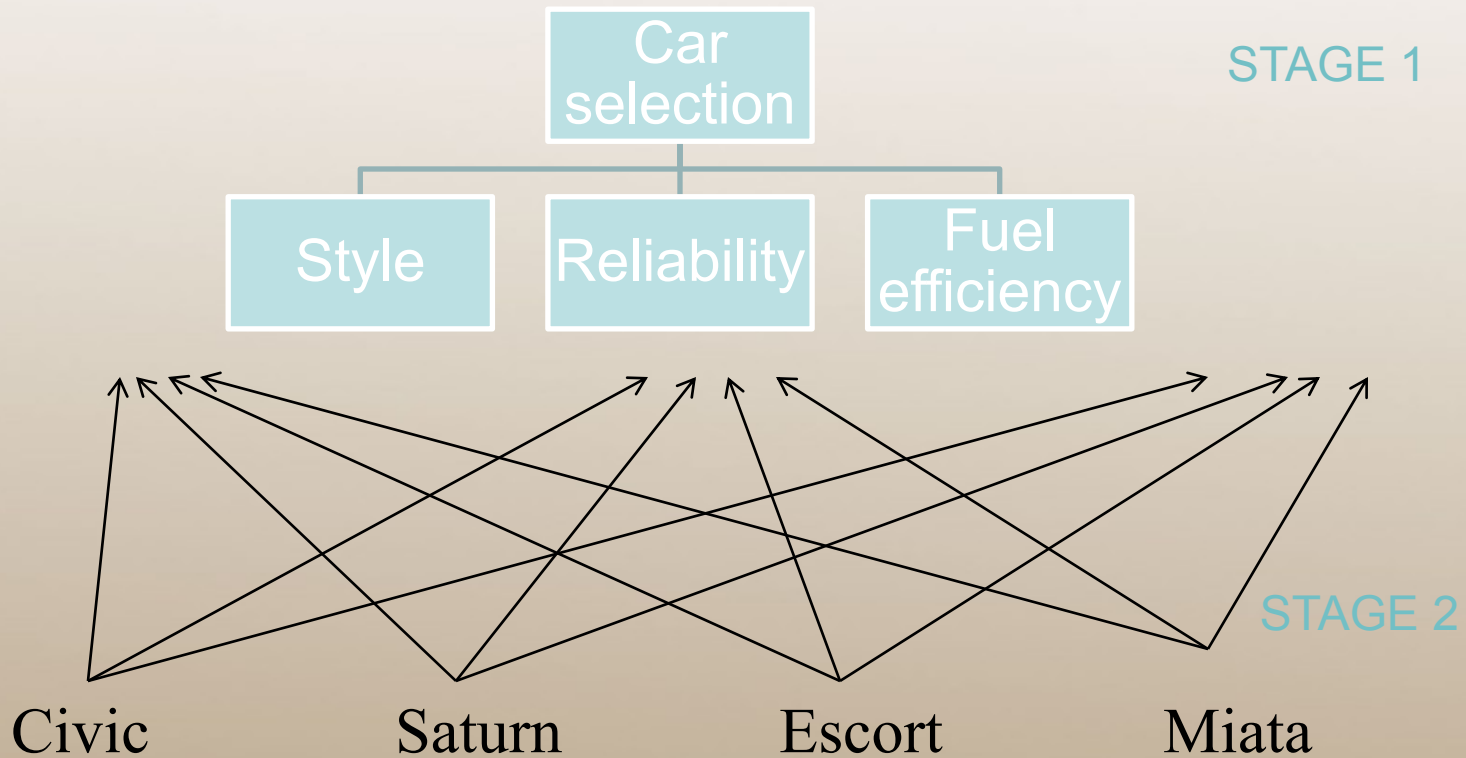

# Example – car selection

- Goal- car
- Criteria – style, reliability, fuel, price
- Alternatives (list of items)
  - Civic Coupe, Saturn Coupe, Ford Escort, Mazda Miata

# Stage 1- Criteria hierarchy

# Ranking criteria and alternatives

- Expert ranking: scale 1-9 : symmetric relation

| Intensyvumas, rangas | Apibrėžimas               |
|----------------------|---------------------------|
| 1                    | Equal                     |
| 3                    | Slightly more important   |
| 5                    | Definitely More important |
| 7                    | Much more important       |
| 9                    | Absolutely more important |
| 2,4,6,8              | Intermediate values       |

Evaluation of Criteria: experts assign importance value by analysis of pairs. Is the criterion i (row) more important to criterion j (column) ?

|                 | Style    | Reliability | Fuel efficiency |
|-----------------|----------|-------------|-----------------|
| Style           | 1        | <b>1/2</b>  | 3               |
| Reliability     | <b>2</b> | 1           | 4               |
| Fuel efficiency | 1/3      | 1/4         | 1               |

Is Reliability (row) more important than Style (column)

Automatic recalculation of symmetric relation

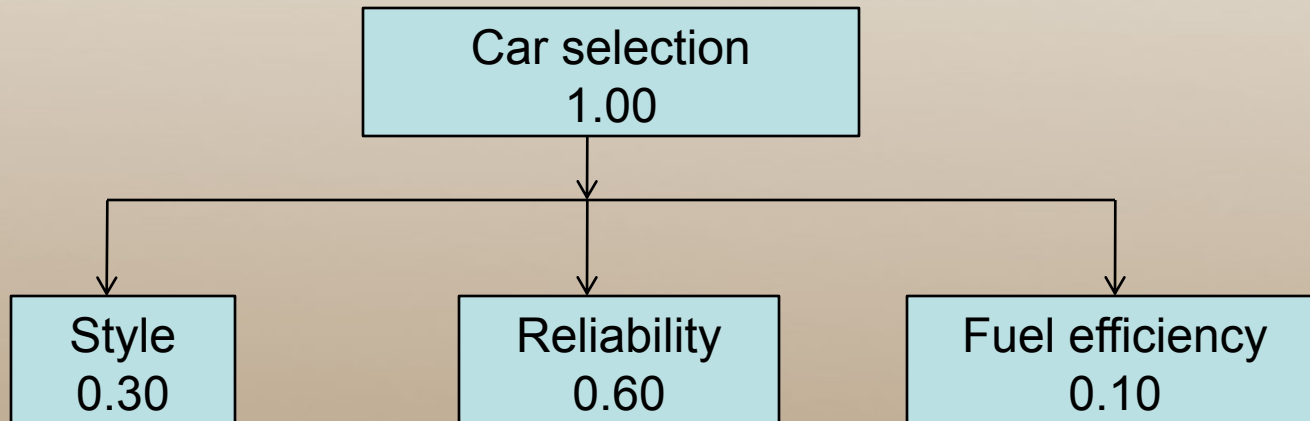

# STAGE 1 output: Criteria weights

- Style 0.30
- Reliability 0.60
- Fuel efficiency 0.10

# Consistency check, evaluation of CR (Consistency ratio)

- Consistency Ratio (CR) shows if the expert evaluations were logical, without self-contradiction or random guess.
- AHP relies on the common logics of expert evaluations – if A is more important than B, and criterion B is more important than C, then A should be more important than C.
- If CR is bigger than 0.1 (>10%) the evaluation matrix is not reliable and has high extent of random guess

# CR calculation

- In order to find eigenvalue  $\lambda_{\max}$  we analyse the matrix expression  $[Ax = \lambda_{\max} x]$  where  $x$  is the weight vector (eigenvector), and  $A$  is the primary (not normalized) expert evaluation matrix,  $n$  is matrix rank (number of rows, columns):

$$\begin{bmatrix} 1 & 0.5 & 3 \\ 2 & 1 & 4 \\ 0.333 & 0.25 & 1.0 \end{bmatrix} \begin{bmatrix} 0.30 \\ 0.60 \\ 0.10 \end{bmatrix} = \begin{bmatrix} 0.90 \\ 1.60 \\ 0.35 \end{bmatrix} = \lambda_{\max} \begin{bmatrix} 0.30 \\ 0.60 \\ 0.10 \end{bmatrix}$$

$\lambda_{\max}$ =average of divided values:  $\{0.90/0.30, 1.60/0.6, 0.35/0.10\}=3.06$

- Consistency **index** is calculated :  $CI=(\lambda_{\max}-n)/(n-1)=(3.06-3)/(3-1)= 0.03$
- Consistency **ratio**  $CR=CI/RI=0.03/0.58=0.05$ . If  $CR<0.1$  evaluations a logical and not random. If  $CR > 10\%$  (0,1) , the experts should revise evaluation or be excluded

Matrix rank  
RI-random index

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 1    | 2    | 3    | 4    | 5    | 6    | 7    | 8    | 9    | 10   | 11   | 12   | 13   | 14   | 15   |
| 0.00 | 0.00 | 0.58 | 0.90 | 1.12 | 1.24 | 1.32 | 1.41 | 1.45 | 1.49 | 1.51 | 1.48 | 1.56 | 1.57 | 1.59 |

# STAGE 2: Assessment of decision alternatives by EACH criterion

| <u>Style</u> | Civic | Saturn | Escort | Miata | <u>Priority vector</u>                                       |
|--------------|-------|--------|--------|-------|--|
| Civic        | 1     | 1/4    | 4      | 1/6   | $\begin{bmatrix} 0.13 \\ 0.24 \\ 0.07 \\ 0.56 \end{bmatrix}$ |
| Saturn       | 4     | 1      | 4      | 1/4   |  |
| Escort       | 1/4   | 1/4    | 1      | 1/5   |  |
| Miata        | 6     | 4      | 5      | 1     |  |

| <u>Reliability</u> | Civic | Saturn | Escort | Miata |  |
|--------------------|-------|--------|--------|-------|--|
| Civic              | 1     | 2      | 5      | 1     | $\begin{bmatrix} 0.38 \\ 0.29 \\ 0.07 \\ 0.26 \end{bmatrix}$ |
| Saturn             | 1/2   | 1      | 3      | 2     |  |
| Escort             | 1/5   | 1/3    | 1      | 1/4   |  |
| Miata              | 1     | 1/2    | 4      | 1     |  |

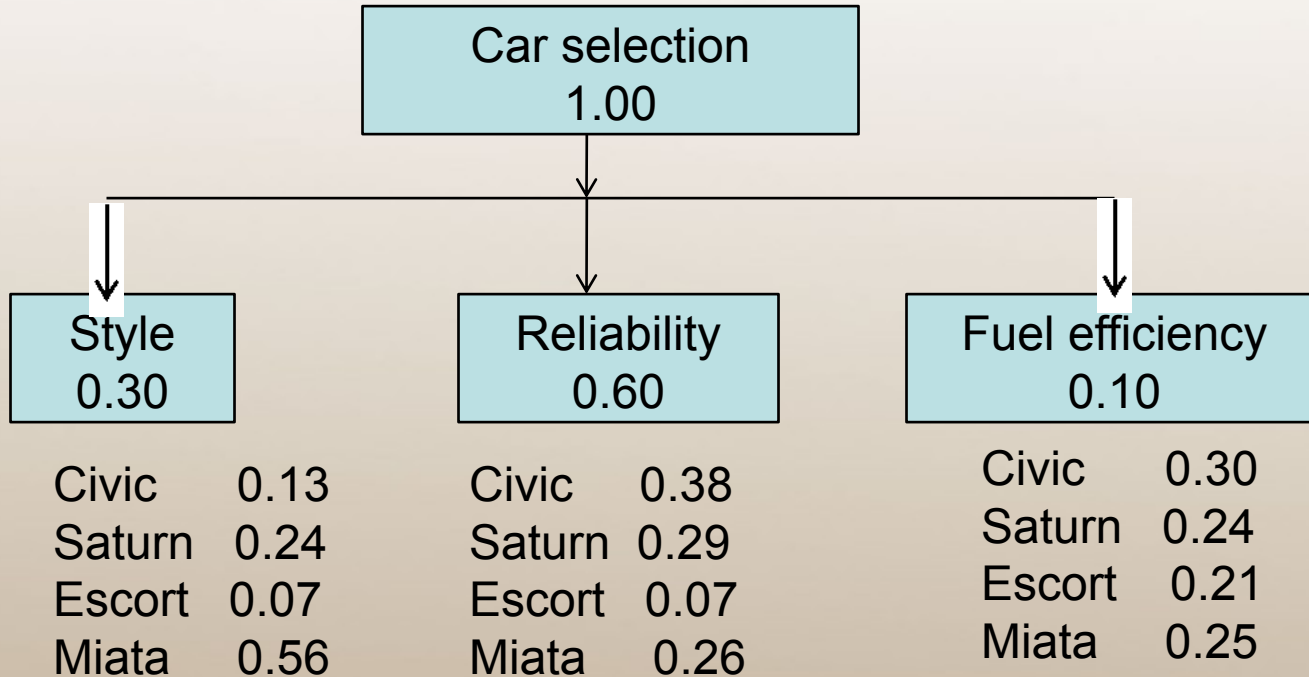

# Ranking values for including quantitative (not expert) evaluation

|                        |               | <u>KM/L</u>      | <u>Normalized</u> |
|------------------------|---------------|------------------|-------------------|
| <u>Fuel efficiency</u> | <b>Civic</b>  | <b>34</b>        | <b>.30</b>        |
|                        | <b>Saturn</b> | <b>27</b>        | <b>.24</b>        |
|                        | <b>Escort</b> | <b>24</b>        | <b>.21</b>        |
|                        | <b>Miata</b>  | <u><b>28</b></u> | <u><b>.25</b></u> |
|                        |               | <b>113</b>       | <b>1.0</b>        |

- The indicators of fuel consumption for 100km is recalculated to the indicator “How many km we can drive with 1 liter” (the bigger value is the better should be used for all evaluations – both quantitative and expert)
- If we’d like to reflect difference of fuel efficiency depending on seasons (winter/summer or surroundings (city/highway), the expert ranking can be used again

# The result of two-stage evaluation: criteria weights and evaluation of alternatives by all criteria

# Cost criterion for decision making

Cost can be included to the list of all criteria for expert pairwise evaluation/ However, it tends to dominate and can hide importance of some criteria.

Instead, it can be used for **COST/BENEFIT** analysis. The normalized price is used to estimate COST (price) and is divided by BENEFIT (global evaluation). The smaller value, the more attractive is alternative, as the benefit exceeds cost (CIVIC is most attractive for smallest ratio 0.73, ESCORT is overpriced comparing to its overall benefit – ratio 2.13))

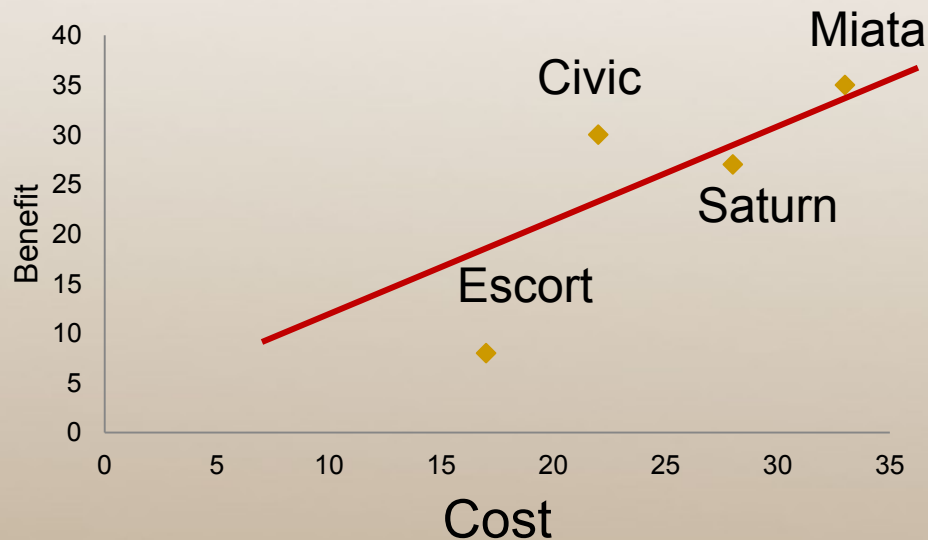

|          | <b>Price</b> | <b>Normalized price</b> | <b>Benefit (global weights)</b> | <b>Cost/Benefit ratio</b> |
|----------|--------------|-------------------------|---------------------------------|---------------------------|
| • CIVIC  | 12K          | 0.22                    | 0.30                            | 0.73                      |
| • SATURN | 15K          | 0.28                    | 0.27                            | 1.03                      |
| • ESCORT | 9K           | 0.17                    | 0.08                            | 2.13                      |
| • MIATA  | 18K          | 0.33                    | 0.35                            | 0.92                      |

# Regression analysis: Graphical visualization of result

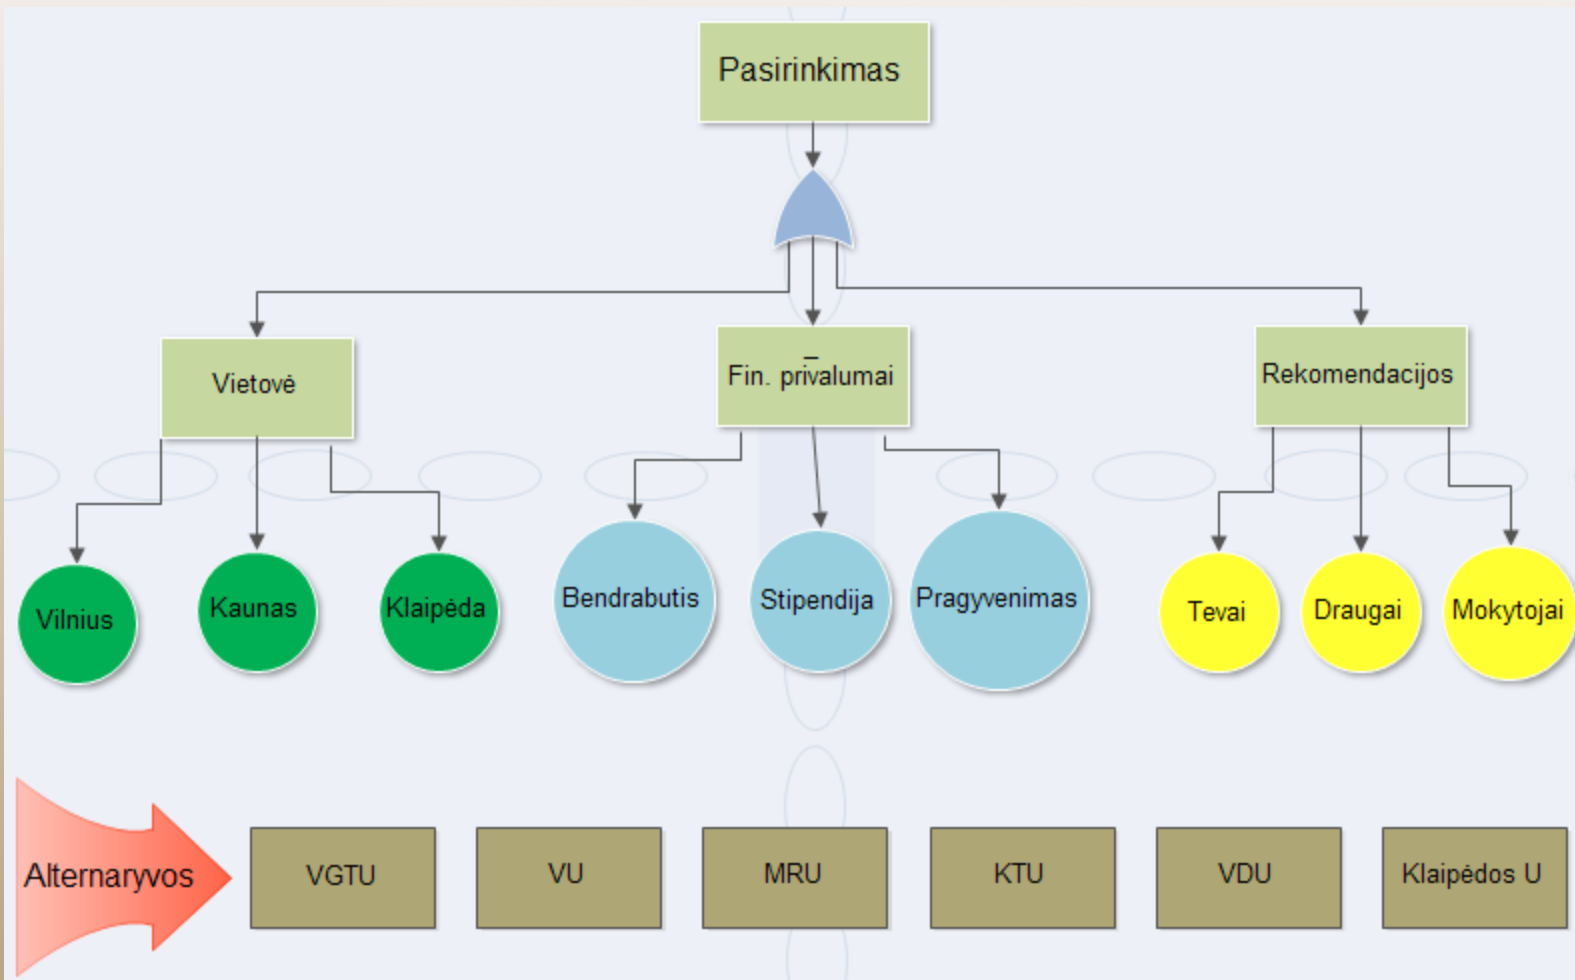

- Regression analysis is applied

- Benefit exceeds the cost (beneficial for us) for all cases above the trendline

# Choosing place to study. Criteria (Location, budget, recommendations). Alternatives (universities)

# Complex decisions

- Many levels of criteria and sub-criteria exists for complex problems.

# Group Decision Making

The AHP allows group decision making, where group members can use their experience, values and knowledge to break down a problem into a hierarchy and solve. Doing so provides:

- Understand the conflicting ideas in the organization and try to reach a consensus.
- Minimize dominance by a strong member of the group.
- Members of the group may vote for the criteria to form the AHP tree. (Overall priorities are determined by the weighted averages of the priorities obtained from members of the group.)

However;

The GDSS does not replace all the requirements for group decision making. Open meetings with the involvement of all members are still an asset.

# More about AHP: Pros and Cons

Pros

- It allows **multi criteria decision making**.
- It is applicable when it is difficult to formulate criteria evaluations, i.e., it allows **qualitative evaluation** as well as quantitative evaluation.
- It is applicable for **group decision making** environments

Cons

- There are hidden assumptions like **consistency**. Repeating evaluations is cumbersome.
- Difficult to use when the **number of criteria or alternatives is high, i.e., more than 7**.
- Difficult to add a **new criterion or alternative**
- Difficult to **take out an existing criterion or alternative**, since the best alternative might differ if the worst one is excluded.

Users should be trained to use AHP methodology.

Use **GDSS**  
Use **constraints** to eliminate some alternatives

Use **cost/benefit** ratio if applicable

# Example 1: : Evaluation of Job Offers

Ex: Peter is offered 4 jobs from Acme Manufacturing (A), Bankers Bank (B), Creative Consulting (C), and Dynamic Decision Making (D). He bases his evaluation on the criteria such as location, salary, job content, and long-term prospects.

Step 1: Decide upon the relative importance of the selection criteria:

|                  | <b>Location</b> | <b>Salary</b> | <b>Content</b> | <b>Long-term</b> |
|------------------|-----------------|---------------|----------------|------------------|
| <b>Location</b>  | <b>1</b>        | <b>1/5</b>    | <b>1/3</b>     | <b>1/2</b>       |
| <b>Salary</b>    | <b>5</b>        | <b>1</b>      | <b>2</b>       | <b>4</b>         |
| <b>Content</b>   | <b>3</b>        | <b>1/2</b>    | <b>1</b>       | <b>3</b>         |
| <b>Long-term</b> | <b>2</b>        | <b>1/2</b>    | <b>1/3</b>     | <b>1</b>         |

# Example 1: Priority Vectors:

- 1) Normalize the column entries by dividing each entry by the sum of the column.
- 2) Take the overall row averages

|                  | <b>Location</b> | <b>Salary</b> | <b>Content</b> | <b>Long-term</b> | <b>Average</b> |
|------------------|-----------------|---------------|----------------|------------------|----------------|
| <b>Location</b>  | 0.091           | 0.102         | 0.091          | 0.059            | 0.086          |
| <b>Salary</b>    | 0.455           | 0.513         | 0.545          | 0.471            | 0.496          |
| <b>Content</b>   | 0.273           | 0.256         | 0.273          | 0.353            | 0.289          |
| <b>Long-term</b> | 0.182           | 0.128         | 0.091          | 0.118            | 0.130          |
|                  | $\frac{+}{1}$   | $\frac{+}{1}$ | $\frac{+}{1}$  | $\frac{+}{1}$    | $\frac{+}{1}$  |

# Example 1: Evaluation of Job Offers

Step 2: Evaluate alternatives w.r.t. each criteria

Location Scores

|   | A   | B   | C   | D |
|---|-----|-----|-----|---|
| A | 1   | 1/2 | 1/3 | 5 |
| B | 2   | 1   | 1/2 | 7 |
| C | 3   | 2   | 1   | 9 |
| D | 1/5 | 1/7 | 1/9 | 1 |

Relative Location Scores

|   | A     | B     | C     | D     | Avg.  |
|---|-------|-------|-------|-------|-------|
| A | 0.161 | 0.137 | 0.171 | 0.227 | 0.174 |
| B | 0.322 | 0.275 | 0.257 | 0.312 | 0.293 |
| C | 0.484 | 0.549 | 0.514 | 0.409 | 0.489 |
| D | 0.032 | 0.040 | 0.057 | 0.045 | 0.044 |

# Example 1: Calculation of Relative Scores

|          | Relative Scores for Each Criteria |        |         |           |   | Relative weights for each criteria |   | Relative scores for each alternative |
|----------|-----------------------------------|--------|---------|-----------|---|------------------------------------|---|--------------------------------------|
|          | Location                          | Salary | Content | Long-Term |   |                                    |   |                                      |
| <b>A</b> | 0.174                             | 0.050  | 0.210   | 0.510     | x | 0.086                              | = | 0.164                                |
| <b>B</b> | 0.293                             | 0.444  | 0.038   | 0.012     |   | 0.496                              |   | 0.256                                |
| <b>C</b> | 0.489                             | 0.312  | 0.354   | 0.290     |   | 0.289                              |   | 0.335                                |
| <b>D</b> | 0.044                             | 0.194  | 0.398   | 0.188     |   | 0.130                              |   | 0.238                                |

# Example 2: AHP in project management

Prequalification of contractors aims at the elimination of incompetent contractors from the bidding process.

It is the choice of the decision maker to eliminate contractor E from the AHP evaluation since it is not “feasible” at all !!

|                     | Contractor A                 | Contractor B  | Contractor C                                  | Contractor D                 | Contractor E           |
|---------------------|------------------------------|---|---|------------------------------|------------------------|
| Experience          | 5 years experience           | 7 years experience                                    | 8 years experience                            | 10 years experience          | 15 years experience    |
|                     | Two similar projects         | One similar project<br>Special procurement experience | No similar project<br>1 international project | Two similar projects         | No similar project     |
| Financial stability | \$7 M assets                 | \$10 M assets   | \$14 M assets                                 | \$11 M assets                | \$6 M assets           |
|                     | High growth rate             | \$5.5 M liabilities                                   | \$6 M liabilities                             | \$4 M liabilities            | \$1.5 M liabilities    |
|                     | No liability                 | Part of a group of companies                          |   | Good relation with banks     |                        |
| Quality performance | Good organization            | Average organization                                  | Good organization                             | Good organization            | Bad organization       |

# Example 2: Hierarchy Tree

# Example 2: AHP in project management

Step 1: Evaluation of the weights of the criteria

Pair-wise comparison matrix for the six criteria<sup>a</sup>

|      | Exp. | FS  | QP  | MPR | ER | CWL | Priority vector |
|------|------|-----|-----|-----|----|-----|-----------------|
| Exp. | 1    | 2   | 3   | 6   | 6  | 5   | 0.372           |
| FS   | 1/2  | 1   | 3   | 6   | 6  | 5   | 0.293           |
| QP   | 1/3  | 1/3 | 1   | 4   | 4  | 3   | 0.156           |
| MPR  | 1/6  | 1/6 | 1/4 | 1   | 2  | 1/2 | 0.053           |
| ER   | 1/6  | 1/6 | 1/4 | 1/2 | 1  | 1/4 | 0.039           |
| CWL  | 1/5  | 1/5 | 1/3 | 2   | 4  | 1   | 0.087           |
|      |      |     |     |     |    |     | $\Sigma = 1.00$ |

<sup>a</sup>  $\lambda_{max} = 6.31$ ,  $CI = 0.062$ ,  $RI = 1.24$ ,  $CR = 0.05 < 0.1$  OK.

Step 2: a) Pairwise comparison matrix for experience

| Exp. | A   | B   | C   | D   | E |
|------|-----|-----|-----|-----|---|
| A    | 1   | 1/3 | 1/2 | 1/6 | 2 |
| B    | 3   | 1   | 2   | 1/2 | 4 |
| C    | 2   | 1/2 | 1   | 1/3 | 3 |
| D    | 6   | 2   | 3   | 1   | 7 |
| E    | 1/2 | 1/4 | 1/3 | 1/7 | 1 |

| Exp. | A    | B     | C     | D     | E     | Priority vector  |
|------|------|-------|-------|-------|-------|------------------|
| A    | 0.08 | 0.082 | 0.073 | 0.078 | 0.118 | 0.086            |
| B    | 0.24 | 0.245 | 0.293 | 0.233 | 0.235 | 0.249            |
| C    | 0.16 | 0.122 | 0.146 | 0.155 | 0.176 | 0.152            |
| D    | 0.48 | 0.489 | 0.439 | 0.466 | 0.412 | 0.457            |
| E    | 0.04 | 0.061 | 0.049 | 0.066 | 0.059 | 0.055            |
|      |      |       |       |       |       | $\Sigma = 0.999$ |

<sup>a</sup>  $\lambda_{max} = 5.037$ ,  $CI = 0.00925$ ,  $RI = 1.12$ ,  $CR = 0.0082 < 0.1$  OK.

# Example 2: AHP in project management

Calculation of priority vector:

|   | Exp. (0.372) | FS (0.293) | QP (0.156) | MPR (0.053) | ER (0.039) | CWL (0.087) |
|---|--------------|------------|------------|-------------|------------|-------------|
| A | 0.086        | 0.425      | 0.269      | 0.151       | 0.084      | 0.144       |
| B | 0.249        | 0.088      | 0.074      | 0.273       | 0.264      | 0.537       |
| C | 0.152        | 0.178      | 0.461      | 0.449       | 0.556      | 0.173       |
| D | 0.457        | 0.268      | 0.163      | 0.081       | 0.057      | 0.084       |
| E | 0.055        | 0.039      | 0.031      | 0.045       | 0.038      | 0.062       |

$$\begin{matrix} \times \\ \end{matrix} \begin{bmatrix} 0.372 \\ 0.293 \\ 0.156 \\ 0.053 \\ 0.039 \\ 0.087 \end{bmatrix} = \begin{bmatrix} 0.222 \\ 0.201 \\ 0.241 \\ 0.288 \\ 0.046 \end{bmatrix}$$

Probably Contractor-E should have been eliminated. It appears to be the worst.

Note that a DSS supports the decision maker, it can not replace him/her. Thus, an AHP Based DSS should allow the decision maker to make **sensitivity analysis** of his judgements on the overall priorities !

# Multi Criteria Decision Making Models: PROMETHEE

- One of the most efficient and easiest MCDM methodologies.
- Developed by Jean-Pierre Brans and Bertrand Mareschal at the ULB and VUB universities since 1982
- Considers a set of criteria and alternatives. Criteria weights are determined that indicate the relative importance
- Utilizes a function reflecting the degree of advantage of one alternative over the other, along with the degree of disadvantage that the same alternative has with respect to the other alternative.
- In scaling, there are six options allowing the user to express meaningful differences by minimum gaps between observations. When type I is used, only relative advantage matters; type 6 is based on standardization with respect to normal distribution.

# Example 3: Media Selection for a Bicycle Co.

A bicycle manufacturing company is intending to advertise its products.

Six marketing actions are considered: Advertising in the international newspaper, *News*; in the newspaper *Herald*; by mean of advertising boards in large cities; of a personal mailing; by TV spots on channels *CMM* or *NCB*.

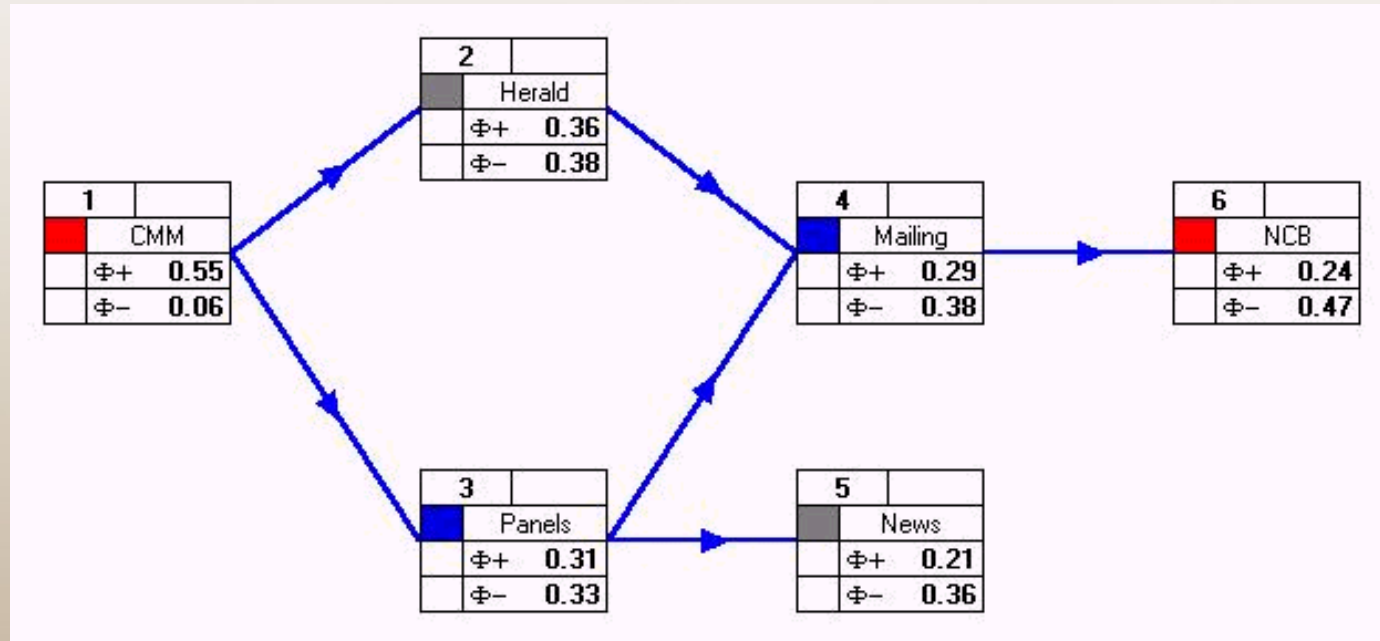

| Criteria       | C1          | C2            | C3            | C4            | C5           |
|----------------|-------------|---------------|---------------|---------------|--------------|
| min/max        | cost<br>min | target<br>max | durat.<br>max | effic.<br>max | manp.<br>min |
| <i>News</i>    | 60          | 900           | 22            | 51            | 8            |
| <i>Herald</i>  | 30          | 520           | 31            | 13            | 1            |
| <i>Panels</i>  | 40          | 650           | 20            | 58            | 2            |
| <i>Mailing</i> | 92          | 750           | 60            | 36            | 3            |
| <i>CMM</i>     | 52          | 780           | 58            | 90            | 1            |
| <i>NCB</i>     | 80          | 920           | 4             | 75            | 6            |

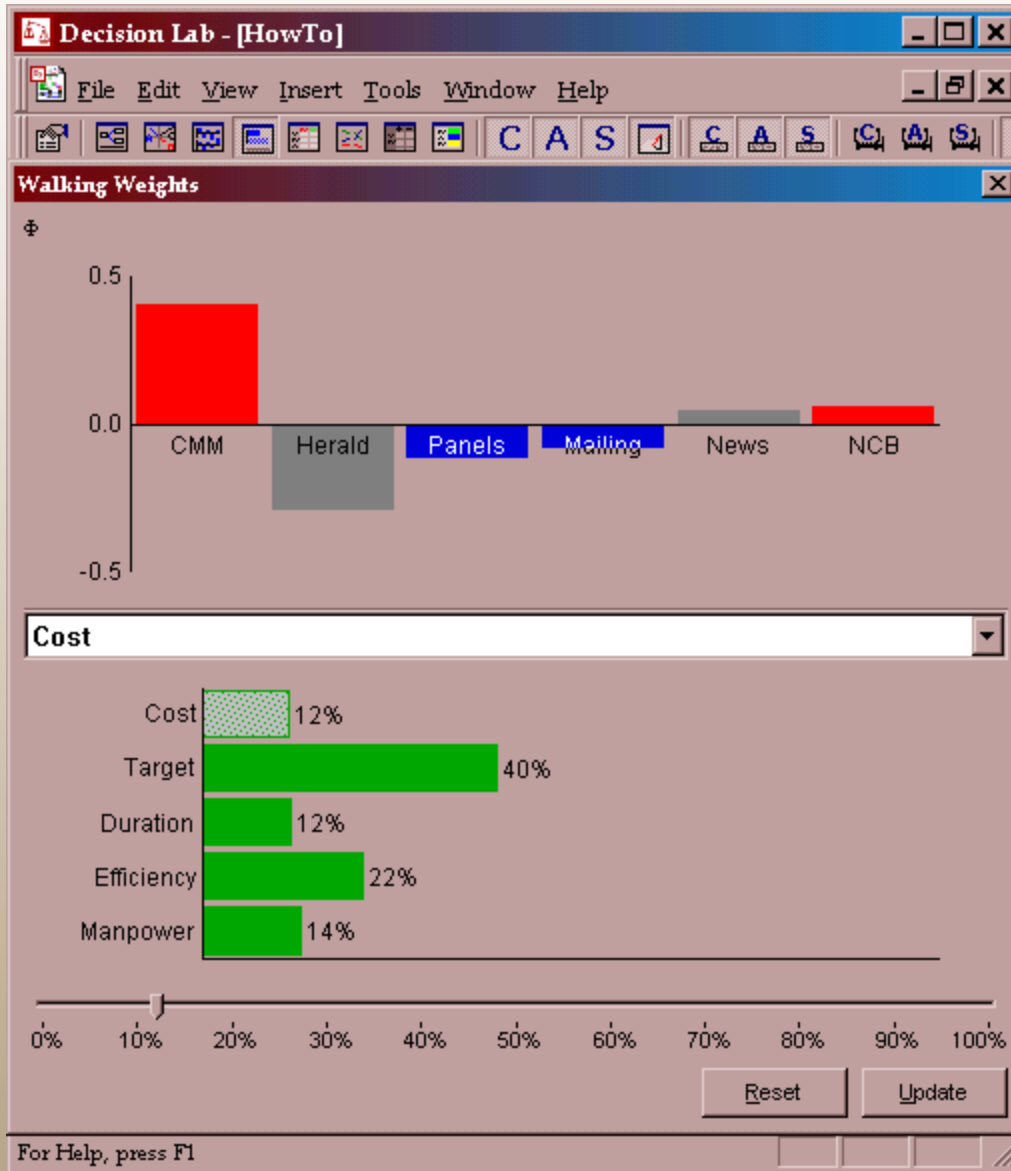

Units: Cost (\$ 1,000), Target (10,000 people), Duration (days), Efficiency (0-100)  
Manpower (# people involved in the company)

# Partial and full rankings with Promethee I and II

Ranking of the alternatives can be obtained for the selected weights

# Including optimization: Additional constraints

- It is often necessary that several alternatives have to be selected subject to a set of goals.
- In this case an LP can be constructed with binary decision variables, which gives the selection of  $r$  actions, among  $n$  alternatives.

Let  $x_i=1$  if media  $i$  is selected and 0 otherwise,  $i=1,2,\dots,6$ .

$\varphi(A_i)$  are the relative weight of media  $i$ ,  $i=1,2,\dots,6$ .

Max  $\varphi(A_1) x_1 + \dots + \varphi(A_6) x_6$

*Subject to*

$x_1 + x_2 + x_3 + x_4 + x_5 + x_6 \geq 2$  (at least 2 media should be selected)

$x_1 + x_2 + x_3 + x_4 + x_5 + x_6 \leq 4$  (at most 4 media should be selected.)

$x_1 + x_2 = 1$  (choose exactly one newspaper)

$x_5 + x_6 = 1$  ((choose exactly 1 TV channel)

$625 x_1 + 550 x_2 + 250 x_3 + 150 x_4 + 175 x_5 + 750 x_6 \geq 1200$  (min. expected return)

$- 60 x_1 - 30 x_2 + 40 x_3 + 92 x_4 + 52 x_5 + 80 x_6 \geq 0$  (cost of advertising in newspapers should be less than 50% of total costs)

# AHP web tool

- <https://bpmsg.com/ahp/>
- Top link- Register (**for the leader of AHP evaluation**)
- After registration an Sign in- use - [My AHP Projects](#)
- For New project press “New hierarchy”. It will consist of two stages: 1 stage: criteria hierarchy is created and evaluated and saved (project type in My projects is “H”).
- 2 stage project will be generated automatically by listing alternatives after stage 1 evaluation phase. This will be shown in the My project list as project type A, same title as H.
- For creating project for stage 1, press “New hierarchy” and edit it (keeping the syntax signs- column, semicolon. E.g.
- ATOSTOGOS:Saule,Gamta,Pramogos,Lankytini objektai;
- Hierarchy is extended by explaining criteria – e.g. „Pramogos“ has to be explained, so the new line is written in the same format:
- Pramogos: Jaunimui, Vaikams, Sportas;
- After creating (save, submit) hierarchy, copy the link for expert evaluation to all members (they must not be registered or signed to the system)

# AHP web tool

- After receiving the link (or the session code), the experts can do evaluation. If they have a session code, they use [AHP Group Session](#) menu. Each place where they see AHP, they have to do evaluation. They evaluate pairs of criteria : chose a dot for the more important criterion, assign value, how much more it is important.
- After submitting evaluation, the „consistency ratio“ is computed by system, and , if CR value  $> 10\%$ , the suggestions for changing evaluation are highlighted. The experts are allowed to revise to reach  $CR < 10\%$  (if this is not achieved, the evaluation will be excluded forom the decision).
- For initiating STAGE 2, project leader reviews the Stage 1 group results, selects "View results" press "Define alternatives" and writes the number of alternatives for discussion in the stage 2 etapui. Then the window opens for writing down the list of alternatives. After Save, the new code for voting is assigned. The new link with the new code is sent out to all experts.
- The same procedure for evaluation (following each AHP in red square) and adjusting CR is done.
- The team report will include the visualizations and tables about voting : criteria weights, alternative weights, table of voting by group members and their results . If some experts have  $CR > 10$ , their results have to be excluded.

# Decision making method: mindmapping

- Mind maps
- <https://www.mindmeister.com/>

It is an idea organization and visualization tool for grouping the ideas, summarizing them for further applying other (quantitative) decision making methods.

# Decision alternatives – evaluation by “6 hats” method

- Present evaluation of alternatives by taking a role, expressed by the hat color:
- White hat – relies on information and facts;
- Yellow – positive support, discuss pros, potential;
- Red – based on emotional argumentation, convincing, taking perspective of market response;
- Black – reserved, critical, cautious thinking and argumentation;
- Green – creativity aspect, comparative evaluation of innovation and creativity influence for development;
- Blue- management aspects, control and summarizing all pros and cons

# Delphi method

- Delphi is based on the principle that forecasts (or decisions) from a structured group of individuals are more accurate than those from unstructured groups.
- The experts answer questionnaires in **two or more rounds**. After each round, a facilitator or change agent provides an anonymised summary of the experts' forecasts from the previous round as well as the reasons they provided for their judgments.
- Thus, experts are encouraged to **revise their earlier answers** in light of the replies of other members of their panel.
- Finally, the process is stopped after a predefined stop criterion (e.g., number of rounds, achievement of consensus, stability of results), and the **mean or median scores of the final rounds determine the results**
