

Mastering git

Lesson 2

Irina Gulina

Tomas Tomecek

Recap Lab 1

Lab 1: Local => Origin

- ▶ Slides 41 and 52 from Lecture #1
 - Create a local repository
 - Make it a version controlled
 - Create a file with some content. What will show `git status`?
 - Notify git about that new file
 - Save your changes in a repository
- ▶ Share your local repository publicly
 - Create an origin
 - How to connect your origin with a local? What protocol? Why?
 - Sync origin and local. How?

Lab 1: Origin => Local

- ▶ Create an origin repository in UI
- ▶ Create a local version of it. How?
- ▶ Difference between init and clone

Any questions or
suggestions?

We have questions!

Questions

- ▶ What is a staging area?
- ▶ In what 4 states can a file be when running `git status`?
- ▶ What does `git commit` do?

Today's class

- ▶ **How does branching work in git**
 - ▶ Best practices for branching
 - ▶ Git tags: how to use them and what's their use case?
 - ▶ Stash: put your current work on a shelf and restore it later.
-
- ▶ Labs: branching!!
 - ▶ Homework 1 assignment

Git Branching

What branch is?

Why do we need branches?

- ▶ Work in parallel
- ▶ Keep main branch free from questionable code
- ▶ Experiment easily

What is the first branch?

```
[Irina@localhost test_git]$ git init
hint: Using 'master' as the name for the initial branch. This default branch name
hint: is subject to change. To configure the initial branch name to use in all
hint: of your new repositories, which will suppress this warning, call:
hint:
hint:   git config --global init.defaultBranch <name>
hint:
hint: Names commonly chosen instead of 'master' are 'main', 'trunk' and
hint: 'development'. The just-created branch can be renamed via this command:
hint:
hint:   git branch -m <name>
```

Git version 2.41.0

Branching operations

- Default branch
- Create a new branch
- List branches
- Switch branches
- Work in parallel on different branches
- Merge branches
- Delete a branch
- Rename a branch
- *Stash changes and tags
- Push and pull a branch to a remote server

Create a branch

```
$ git branch testing
```

List branches

```
$ git branch <--list>  
$ git branch -v  
$ git branch -vv  
$ git branch -a
```

Switch branches

```
$ git switch testing
```

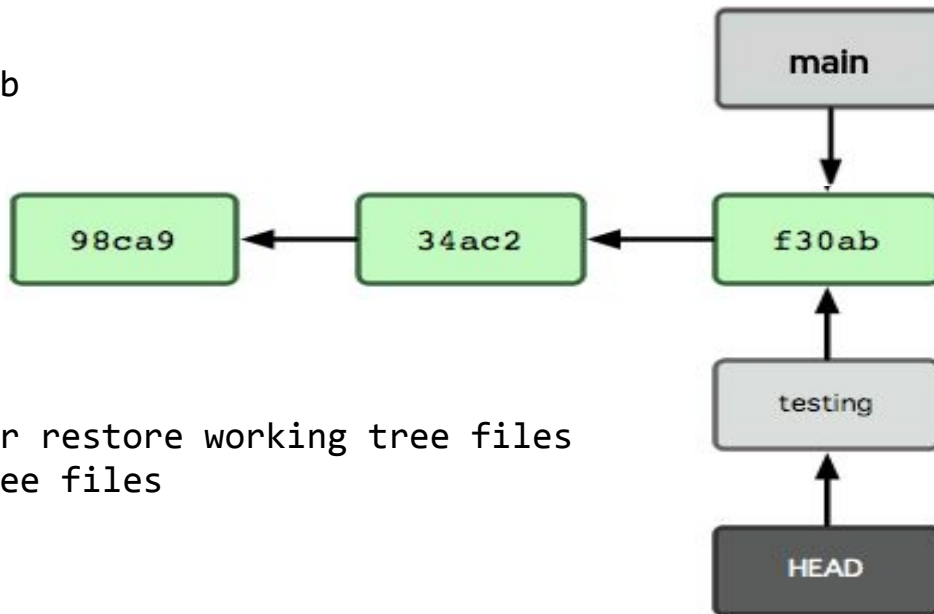

Create and switch

```
$ git switch -c testing
```

Switch vs Checkout

```
$ git switch = git checkout  
$ git switch -c = git checkout -b
```

```
git-checkout - Switch branches or restore working tree files  
git-restore - Restore working tree files  
git-switch - Switch branches
```

HEAD

`.git/refs/heads/`
`.git/HEAD`

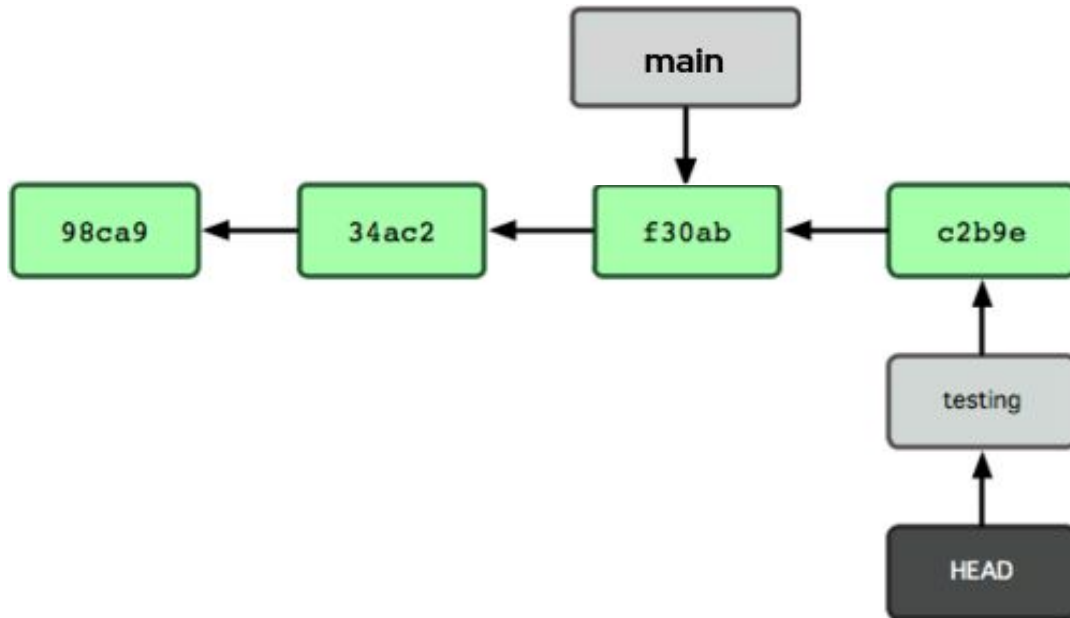

Work in parallel

```
$ touch file.txt  
$ git commit -a -m "add file.txt"
```

Work in parallel

```
$ git switch main
```

Work in parallel

```
$ touch file2.txt  
$ git commit -a -m "add file2.txt"
```

Rename a branch

```
$ git branch -m <new_name>
```

Merge branches

```
$ git switch main  
$ git status  
$ git fetch  
$ git pull  
$ git merge hotfix
```

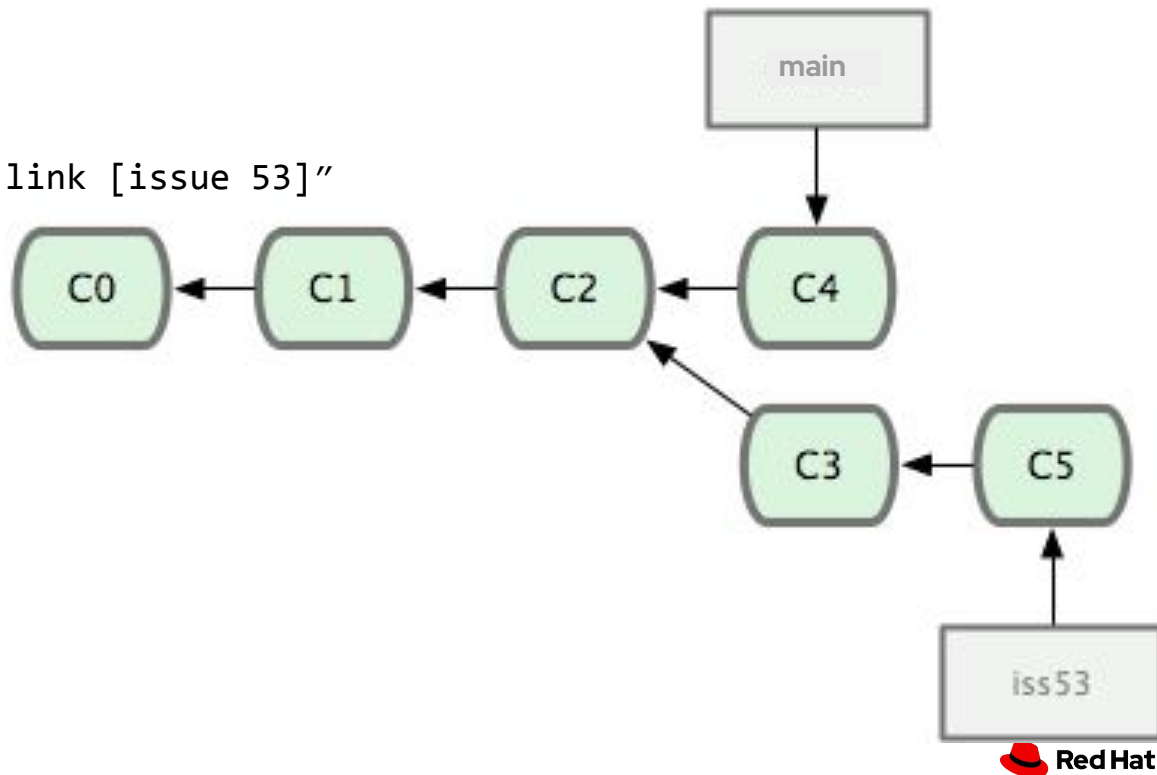

Merge branches (ff)

```
$ git switch main  
$ git status  
$ git fetch  
$ git pull  
$ git merge hotfix
```

Merge branches

```
$ git switch iss53  
$ vi index.html  
$ git commit a -m "fix link [issue 53]"
```

Merge branches (merge commit)

```
$ git switch main  
$ git status  
$ git merge iss53
```

Merge branches

0 conflicts ♥
merge successful

Delete a branch

```
$ git branch -d testing  
$ git branch -D testing
```

```
$ git push origin --delete testing  
$ git push origin :testing
```

Stash

git stash

A special “branch”

git has high-level operations to work with it

Handy to put things on side

git stash (commands)

git stash list

git stash show

git stash [push]

git stash apply vs. git stash pop

stash@{2}

git log stash

THE END

Tags

git tag

Points to a commit and doesn't change as you commit more

Used mainly to track releases and deployments

Lightweight vs. Annotated

Push/pull tags

Test your knowledge now!

Task

- ▶ Fork this repo and clone it: <https://gitlab.com/redhat/research/mastering-git/>
- ▶ Create a branch
- ▶ Switch to that branch
- ▶ List branches
- ▶ Create another branch
- ▶ Switch to it and create a commit
- ▶ Switch to the previous branch and merge the last branch into it
- ▶ Delete the previous branch
- ▶ Special task: create a new branch and merge it into the first branch in a way so it's not fast-forward: there is a merge commit

THE END

Questions?

Class 2 homework

<https://gitlab.com/redhat/research/mastering-git#class-2-homework>

All homework info will be in README.md

Bonus Task

Make a contribution to an Open Source project.

- ▶ Not an University Project
- ▶ Not owned by you
- ▶ MR/PR doesn't need to be merged by the Task/Course deadline
- ▶ A change can be of any content (not necessary code, it can be docs for example), but it must be meaningful, positive
- ▶ See details in "Mastering git" Readme
