Task 2 Reading - Orthopedic physical therapy

Orthopedic physical therapy focuses on the problems of the muscular skeletal system (muscles, bones, ligaments or tendons). It deals with diagnosing, managing and treating injuries and problems and rehabilitating right after orthopedic operations, as well. Orthopedic therapy workers function *particularly* in treating post-operative joints, injuries *due to* sporting activities, arthritis and amputations.

Orthopedic physical therapy is very important for *restoring* the patients' activity, strength and motion right after injuries or surgery. You can find a number of things therapists can do in orthopedic physical therapy and there are lots of rehabilitation tools that they have on hand. Among these we should mention: stretching, strengthening, ice and heat therapy (hot and cold packs), electrical stimulation, ultrasound, etc.

Stretching is necessary if a patient has a stiff joint which can affect normal activities *severely*. Proper stretching exercise can assist to *preserve* such functions. To help a patient in improving the function of his/her muscles, increasing endurance and maintaining or improving the range of motions strengthening *workouts* are used.

The ice and heat therapy warm up and cool off muscles and *contribute to* the stimulation of blood circulation and assist to decrease swellings, as well. By using an ultrasound probe, deep tissues are stimulated and warmed while the *blood flow* will improve.

a) Answer the questions:

Which problems does orthopedic physiotherapy focus on?
Which conditions is it required for?
What are the main orthopedic instruments?
When are stretching exercises necessary?
How is ice and heat therapy used?

b) Replace the expressions in bold with synonyms.

Task 3 Word formation

1. I wrote a for a course of antibiotics. (PRESCRIBE)
2. He has made a full (RECOVER)
3. The lab made an of the blood sample. (ANALYZE)
4. The patient was given a hip (REPLACE)
5. The patient was given a to a specialist. (REFER)
6. His arm was after the stroke. (PARALYSIS)
7. The blood clot formed an in the artery. (OBSTRUCT)
8. The surgeons operated to repair the patient's heart valve. (DEFECT)
9. His diet is calcium-..... (DEFICIENCY)
10. The doctor noted an amount of bile in the patient's blood. (EXCESS)
11. She complained of joints. (STIFFNESS)
12. He was diagnosed with cancer but thankfully his tumour is (OPERATE)
13. Fruit juices can be to your teeth. (HARM)

Task 4 Idioms

Read the sentences below and see if you understand the meaning of idiomatic phrases:

- a) I had a good cry and *got it out of my system*.
- b) The woman *went under the knife* at the hospital last evening.
