

## The History of the Universe

This text presents a brief sum up of TED talk by David Christian who described the main thresholds of the history of the universe.

According to David Christian the principle of the universe is to move from order and structure to lack of both - order and structure while becoming complex and fragile. The complexity is created by coincidence (what takes time) and information transfer (e.g. DNA, human language). With human collective learning ability more complex system has been created and it is still evolving.

Regarding the tendency described above the process will continue, but Christian warned, the human kind does not have to be in charge of the collective learning which may bring ecological problems or wars. Consequently it could destroy the Earth due to high fragility. In conclusion people should learn from the history in order to understand today's world.

Excellent vocab and grasp of the ideas. Be careful that all linkers at the start of a sentence always end with a comma – Consequently, ... In conclusion,
