

ELECTROCARDIOGRAPHY

- 1893 Einthoven introduces the term 'electrocardiogram'
- 1895 Einthoven distinguishes five deflections - P, Q, R, S and T
- 1902 Einthoven publishes the first electrocardiogram
- 1905 Einthoven starts transmitting electrocardiograms from the hospital to his laboratory 1.5 km away via telephone cable
- 1924 the Nobel prize

Willem Einthoven

1860 - 1927

ELECTROCARDIOGRAPHY = methods enabling to register electrical changes caused by heart activity from body surface.

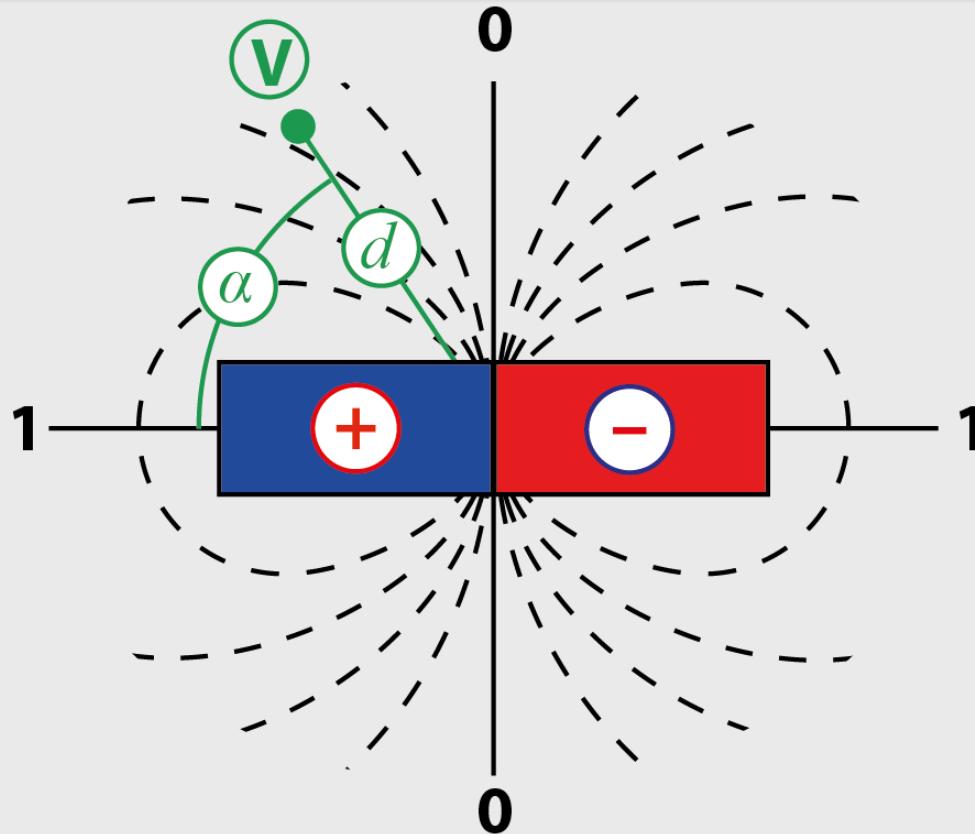

ECG – information about:

1. **Frequency disorders** (changes of HR in SA node or arrhythmias, sick sinus syndrome)
2. **Conduction disorders** (blocks – SA, AV)
3. **Rhythm disorders** (ES – supraventricular, ventricular)
4. **Disorders of ventricular gradient** (relationship between depolarisation and repolarisation:

origin – metabolic, haemodynamic, anatomic, physical...ischemia, hypertrophy, dilatation, cardiomyopathy, inflammations, changes in electrolytes, drugs...)

ELECTRICAL DIPOLE

stationary in homogenously conducting environment

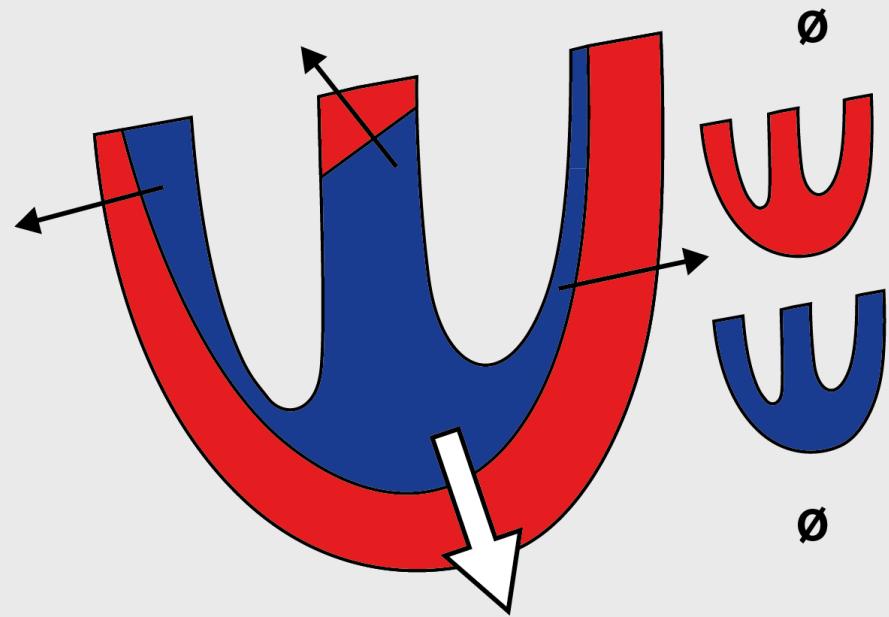

Local currents

- Maximal in dipole axis (1)
- Zero in the place of the centre (0)

SPREADING OF DEPOLARIZATION FRONT

ELECTRICAL FIELD OF THE HEART (vector)

- Consists of sum of momentary dipoles on the depolarization front
- **Its size** is a function of number of dipoles and steepness of boundary line
- **Direction from** depolarized (-) to (re)polarized (+) area

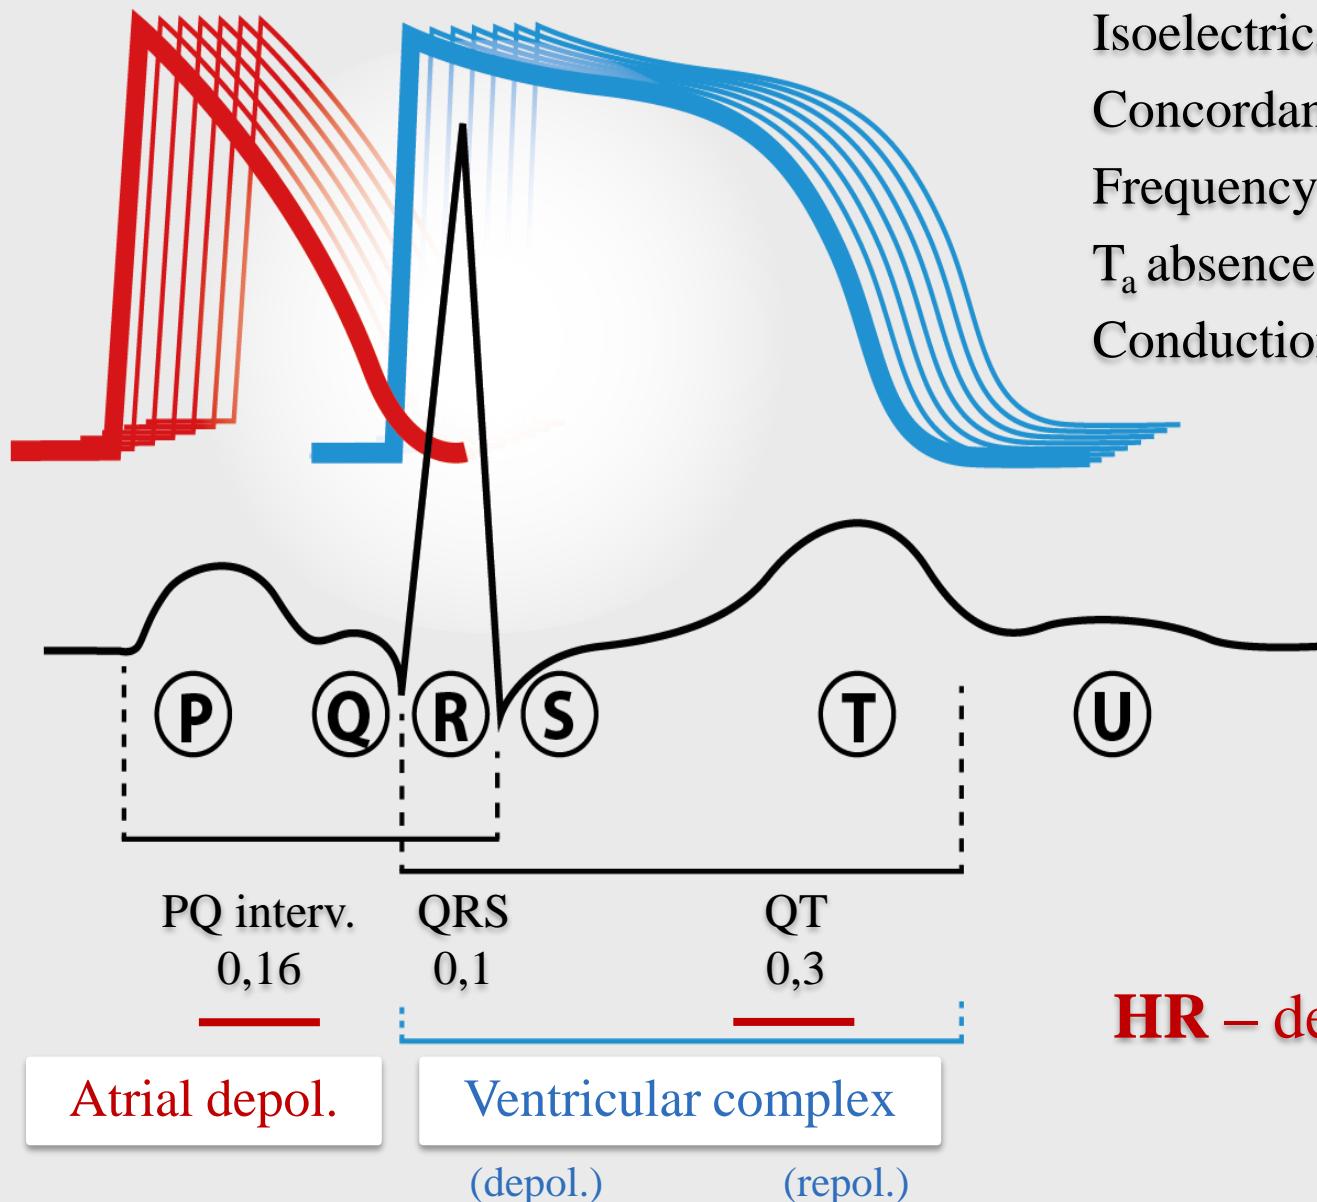

REGIONAL VECTORS

INTEGRAL VECTOR

during excitation is changing:

- Size of momentary dipoles
- Their direction
- They are spreading to body surface – **ELECTROCARDIOGRAPHY**

Concordance of T wave
Frequency dependence
 T_a absence
Conduction system

3D SMYČKY SRDEČNÍHO VEKTORU

F – frontální rovina hrudníku

S – sagitální rovina hrudníku

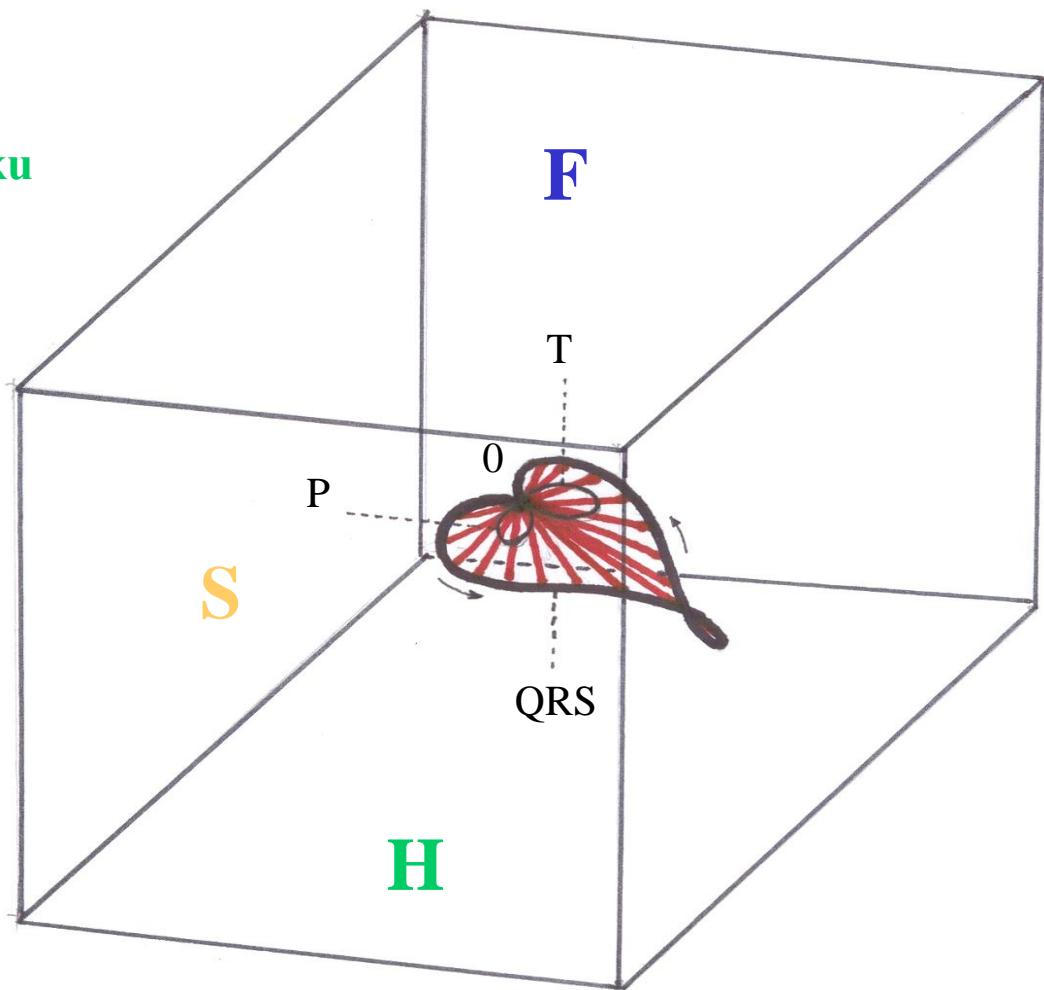

H – horizontální rovina hrudníku

0 – elektrický střed srdce

P – síňová depolarizace

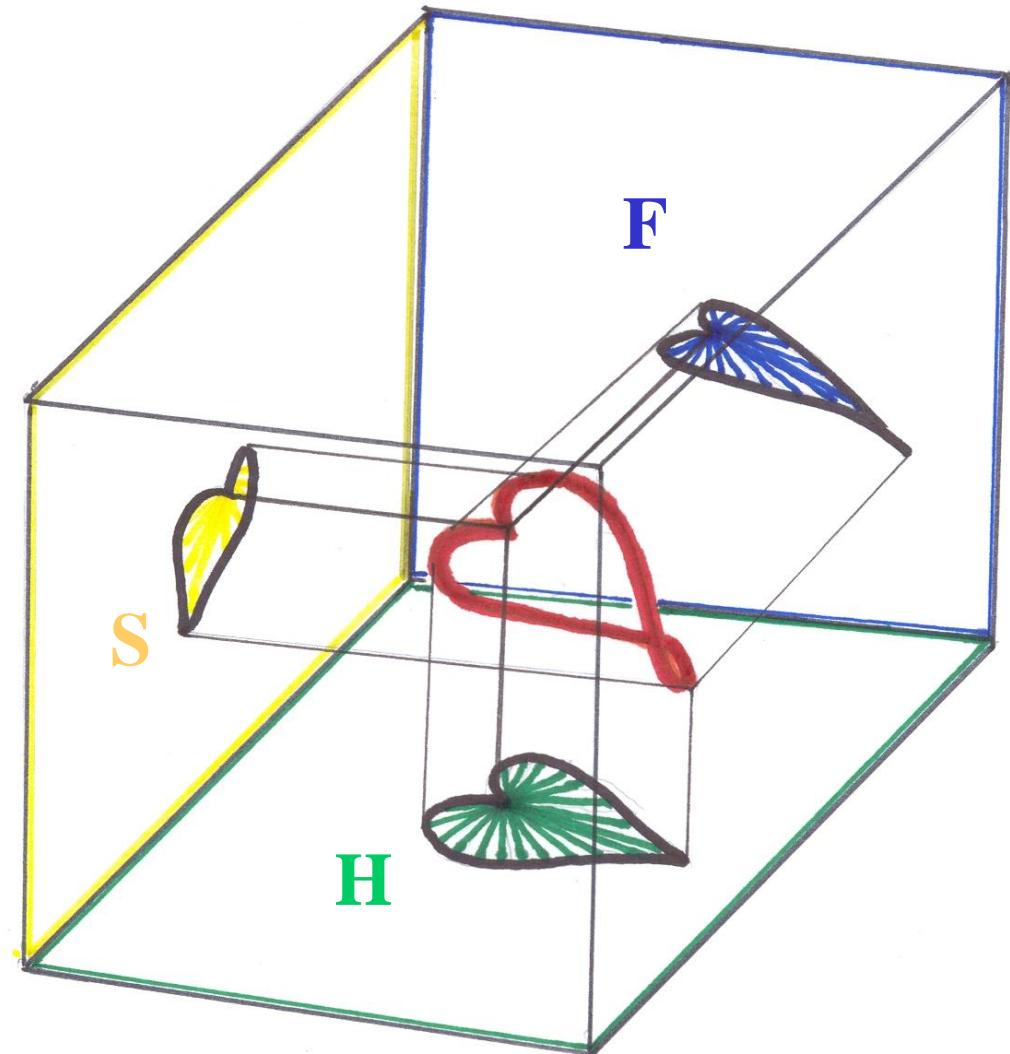

QRS – komorová depolarizace

T – komorová repolarizace

2D PROJEKCE HLAVNÍHO SRDEČNÍHO VEKTORU

F – frontální rovina hrudníku
S – sagitální rovina hrudníku
H – horizontální rovina hrudní

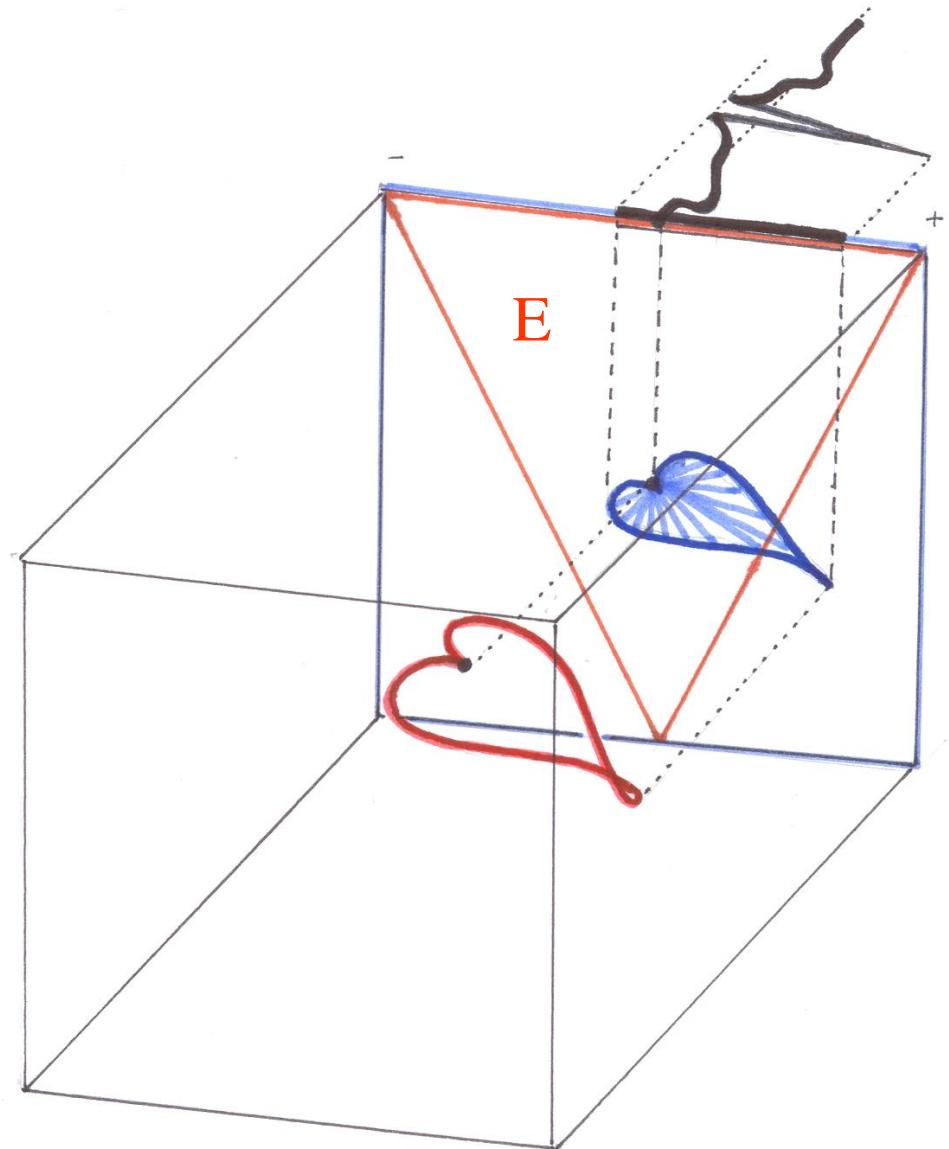

1D PROJEKCE HLAVNÍHO SRDEČNÍHO VEKTORU

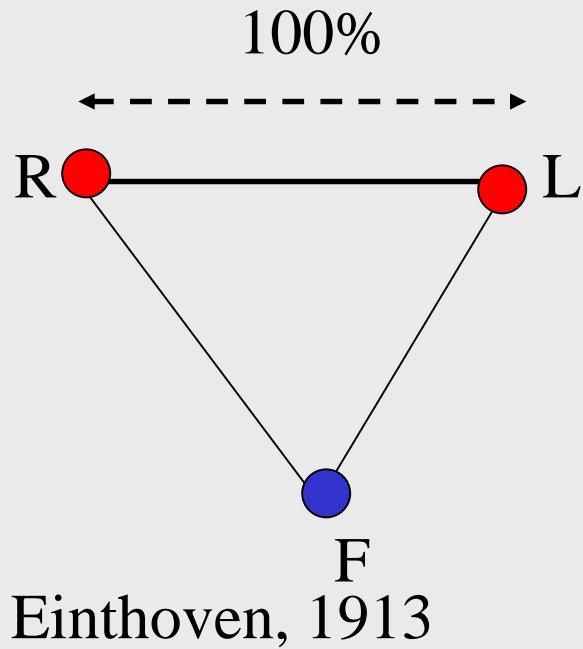

Projekce na povrch hrudníku
do frontální roviny (2D)

a její projekce na přímku
(1D), osu I. EKG svodu

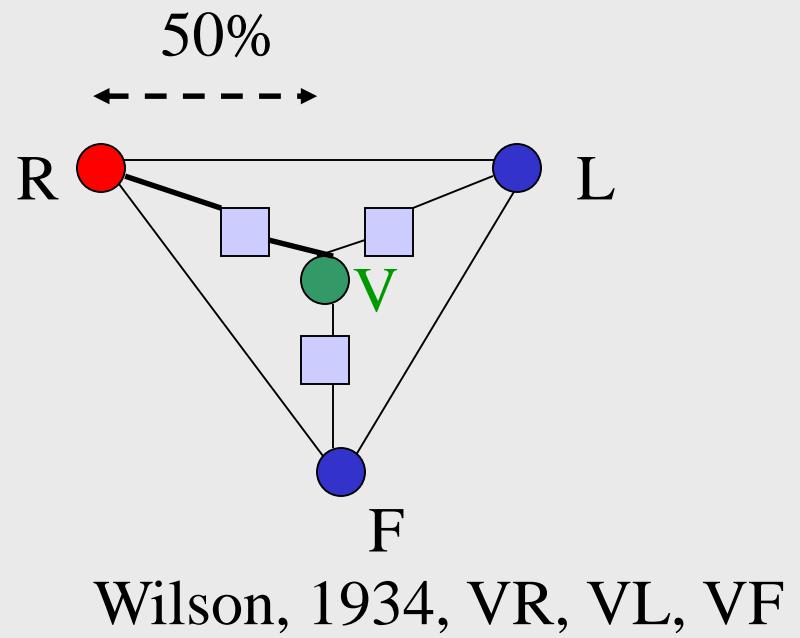

rozepsaná v čase

E – Einthovenův trojúhelník

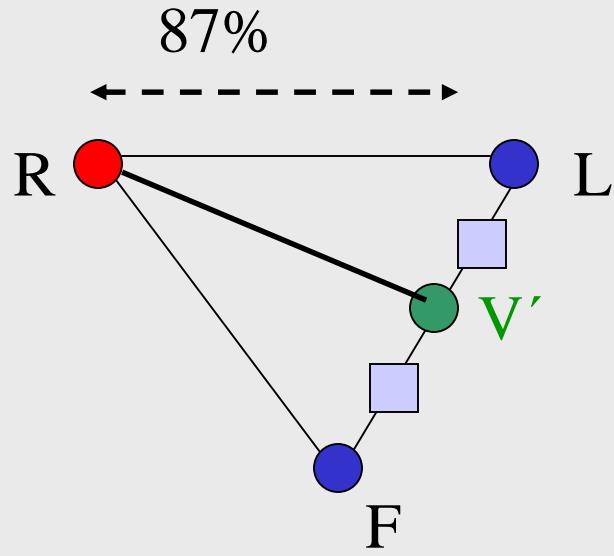

Einthoven, 1913
I, II, III

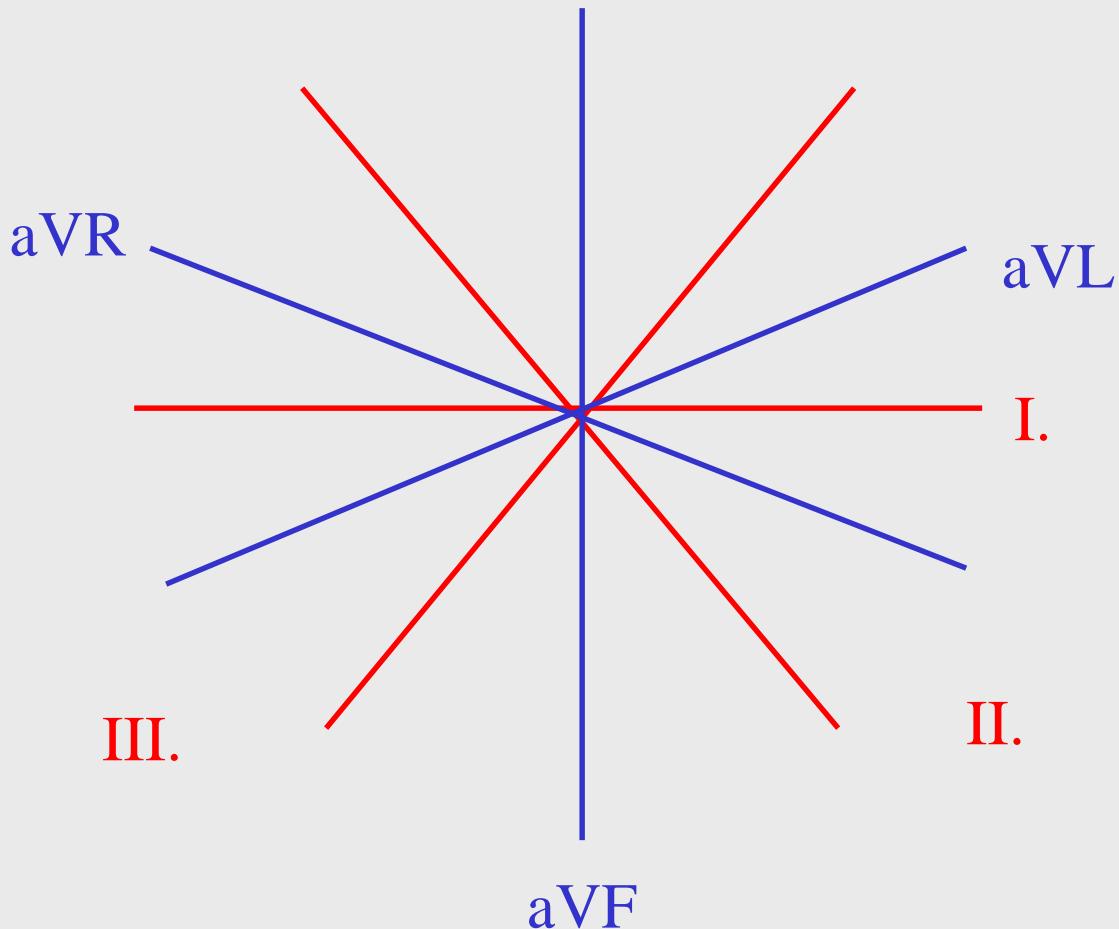

Wilson, 1934, VR, VL, VF

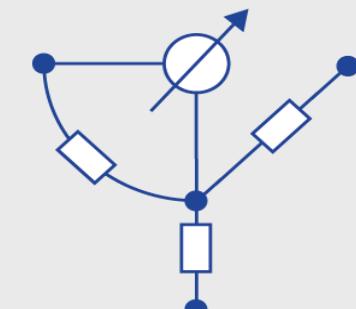

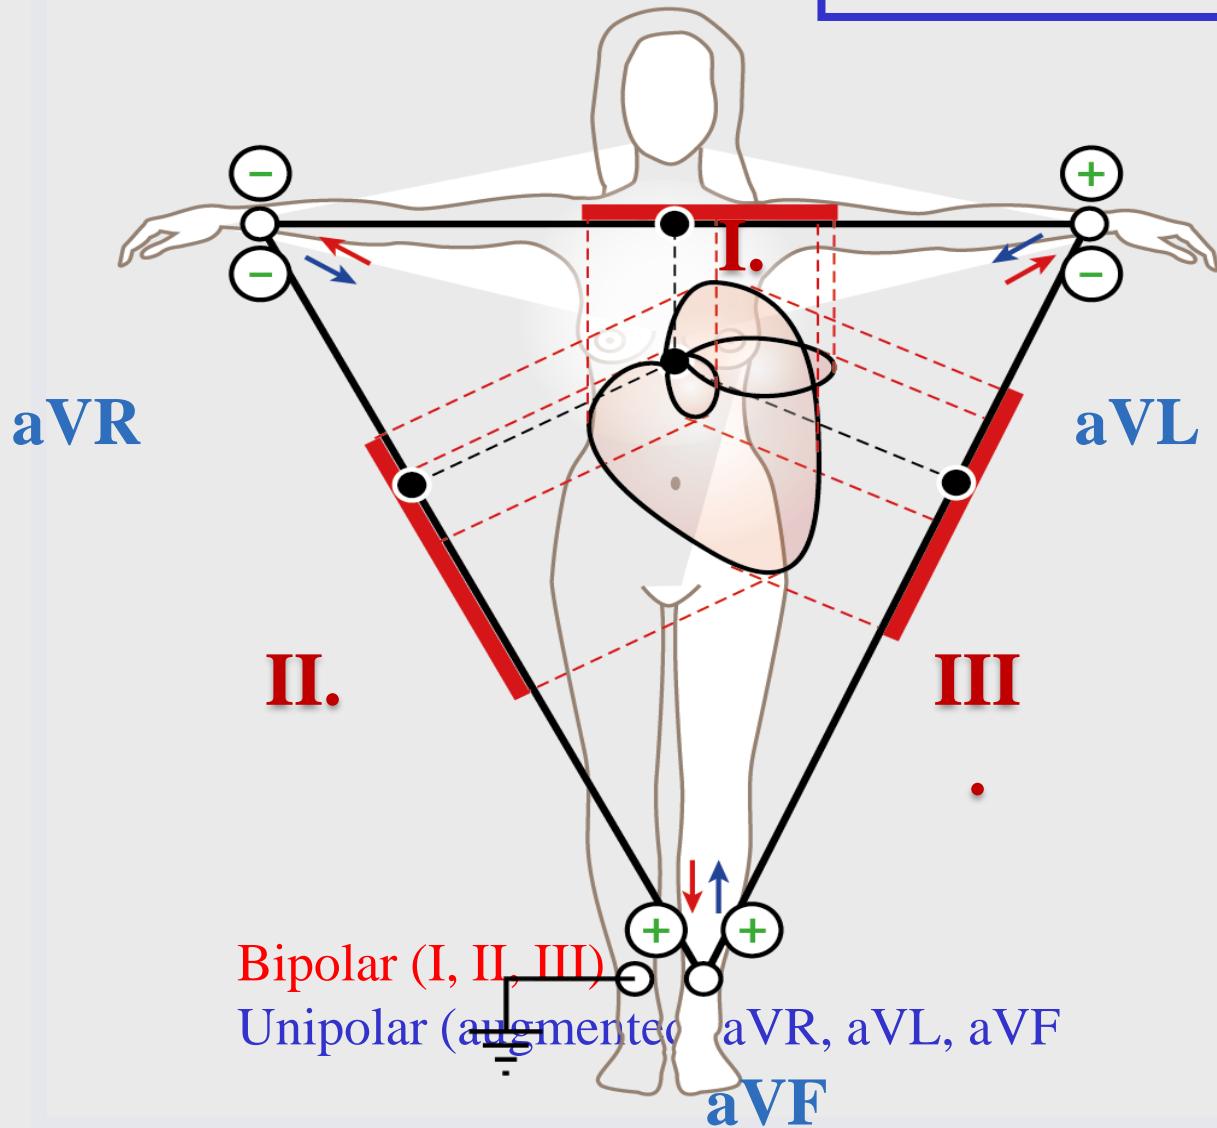

Goldberger, 1947, aVR, aVL, aVF

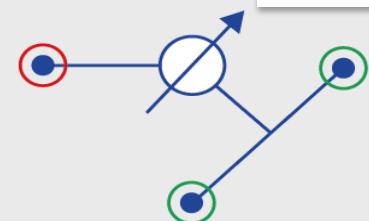

HEXAAXIAL SYSTEM

LIMR LEADS

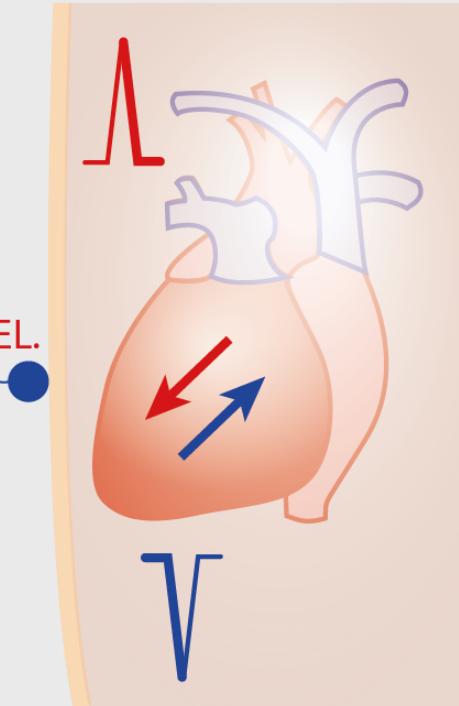

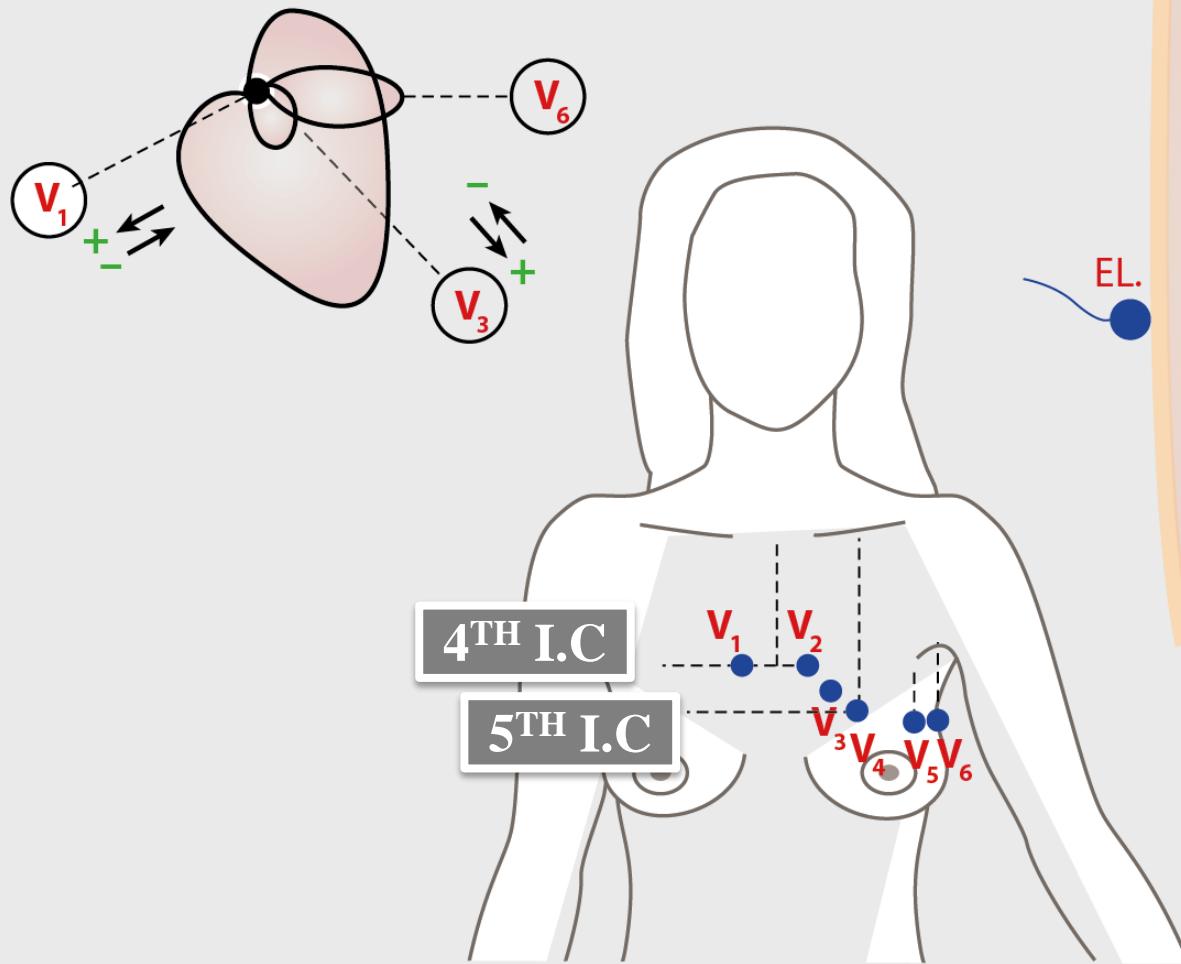

WILSON

GOLDBERG

Terminology

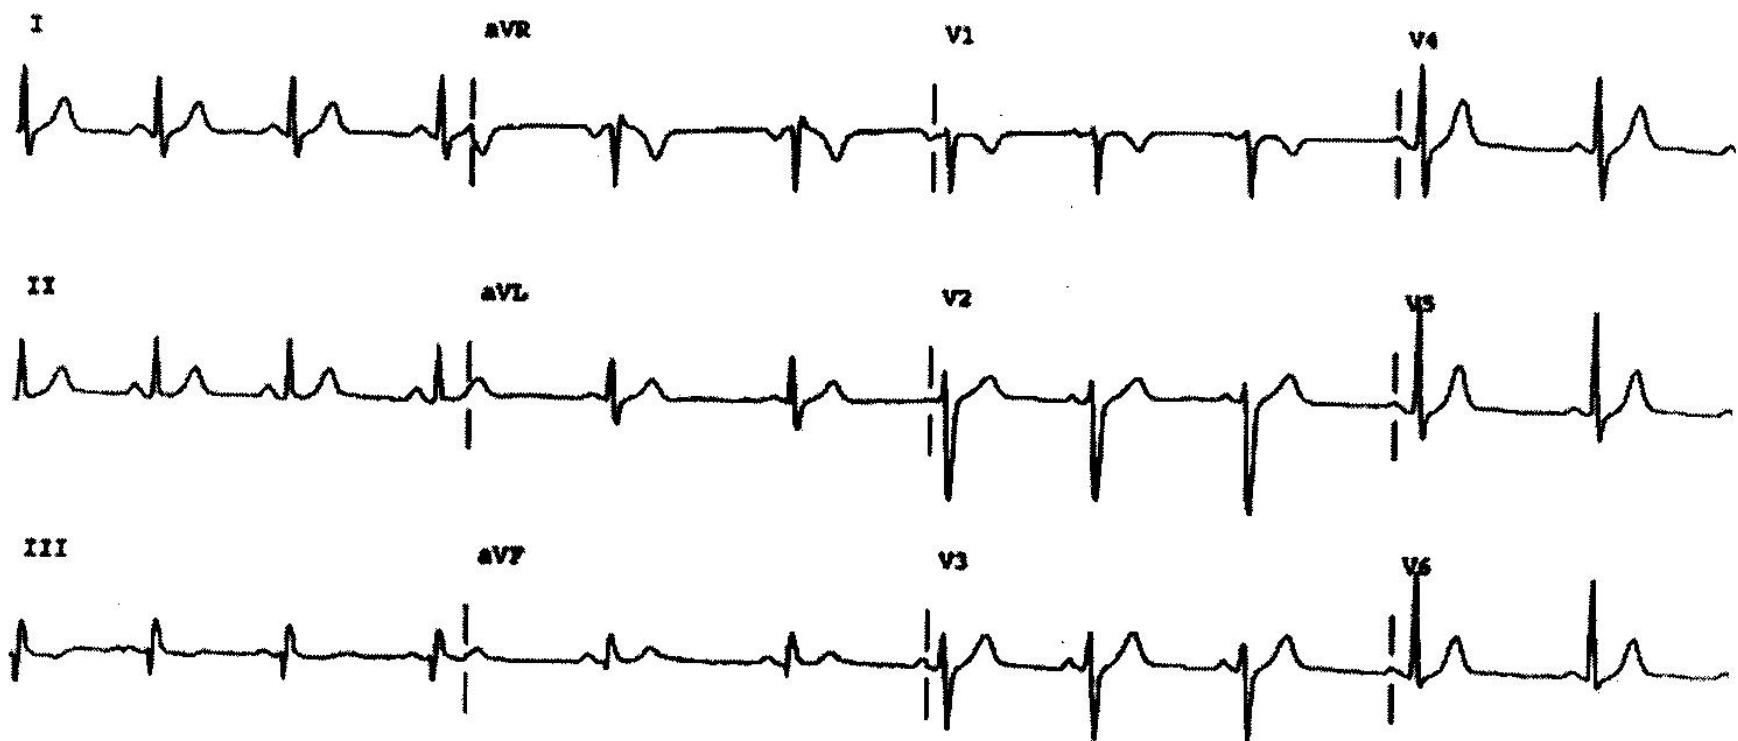

ELECTRICAL AXIS OF THE HEART

Summary of all momentary vectors, which form ventricular depolarisation loop. Expresses the direction of ventricular activation. Reflects asymmetry in ventricular wall thickness and the position of the heart in the chest.

LEFT DEVIATION, RIGHT DEVIATION

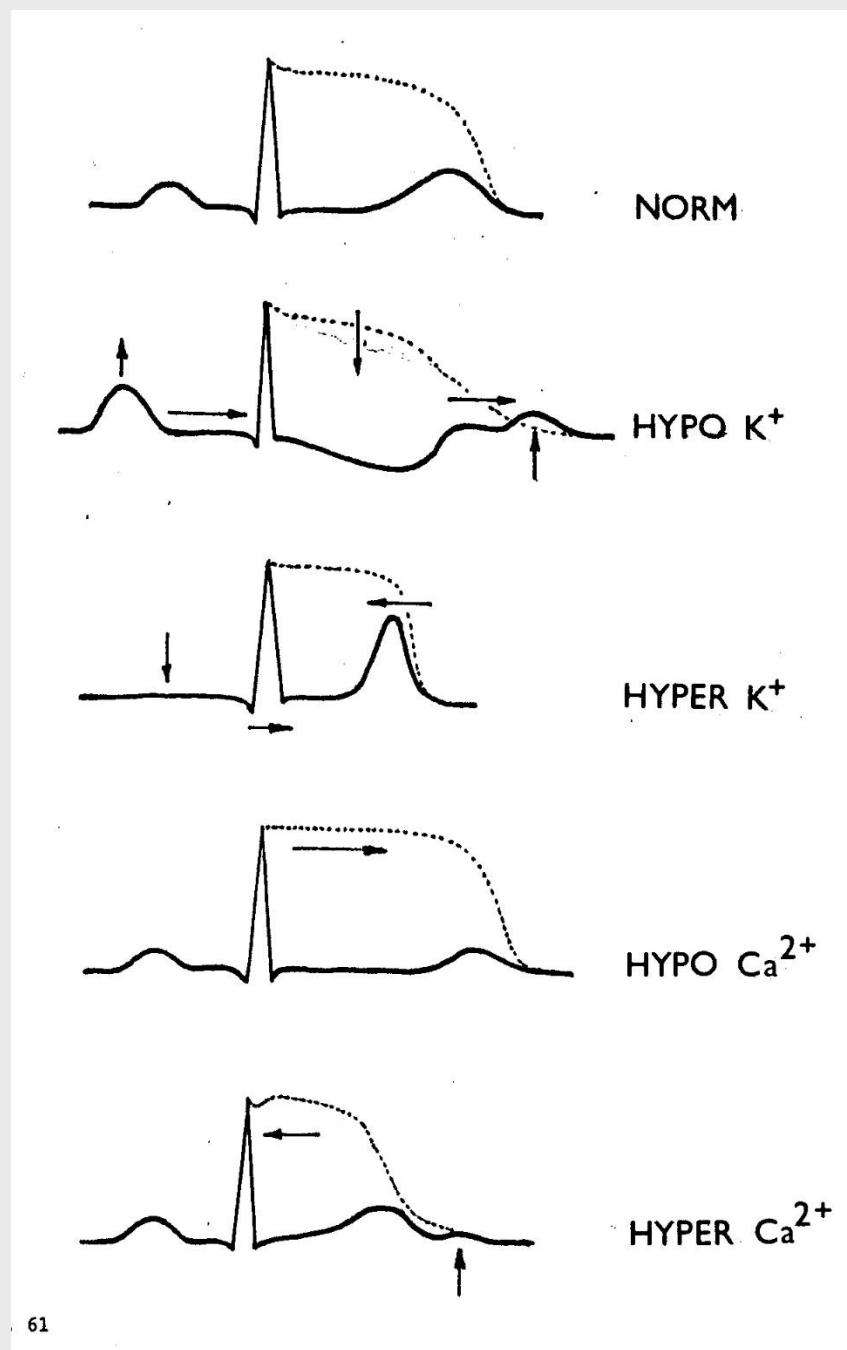

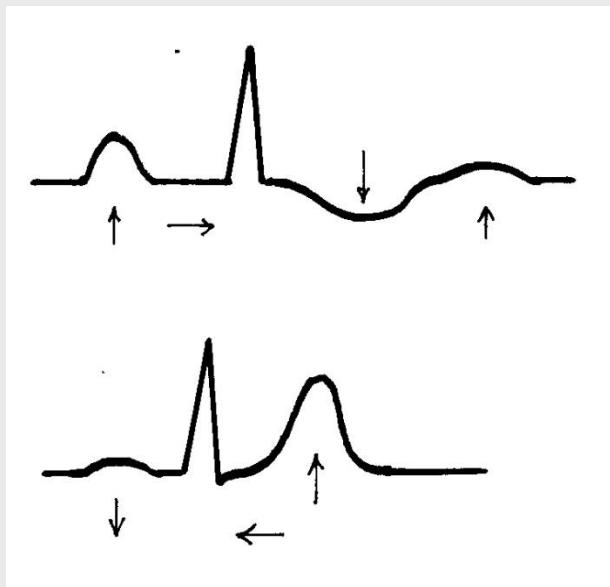

Normal 12-lead electrocardiogram

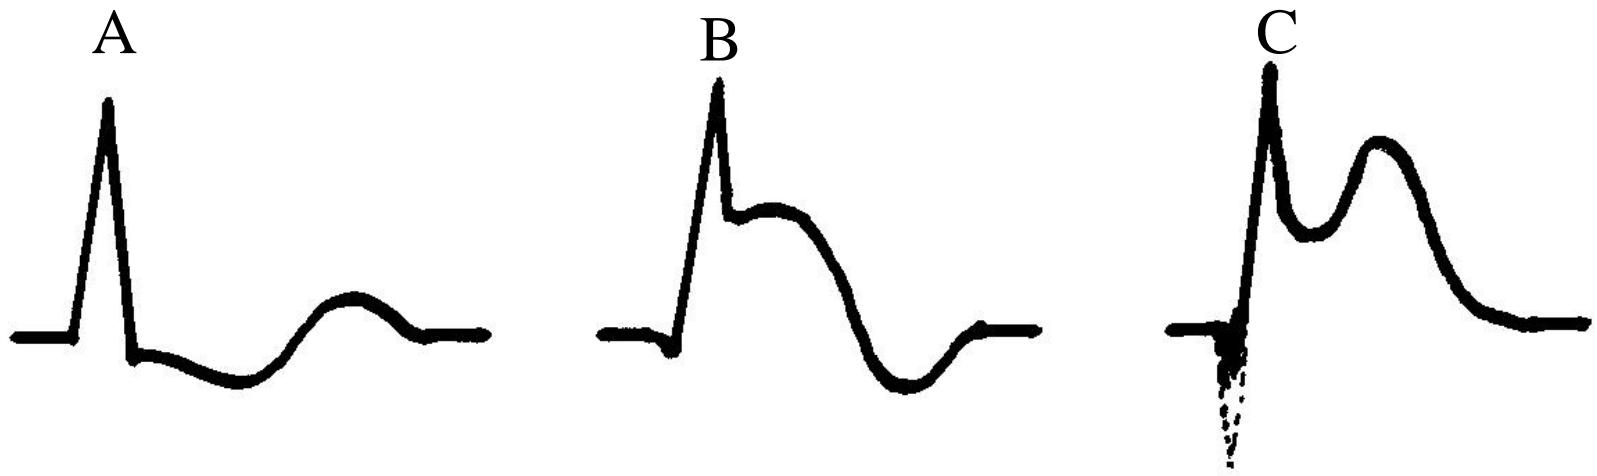

ECG – information about:

1. Magnitude and position of the heart (electrical axis)
2. Site of impulse origin (P, QRS)
3. Conduction path (P-Q, QRS)
4. Impulse regression (T)
5. Rhythm (P-P, R-R)
6. Action potential alterations (ST, T)
7. Effect of drugs, remedies, ion composition changes,...

HEART ISCHEMIA

A: exercise angina pectoris

B: acute non-Q myocardial infarction

C: acute Q myocardial infarction

ARRHYTHMIAS

DISTURBANCES OF IMPULSE GENERATION OR CONDUCTION

RHYTHM: Regular

HEART RATE (normal range: 70 – 220 bpm; effect of age)

1. Sinus tachycardia (60 - 100 bpm; exercise; aging)

2. Sinus bradycardia (below 60 bpm; athletes' heart)

(nodal rhythm below 40 bpm, ventricular rhythm below 20 bpm)

RHYTHM: Irregular

sinus respiratory arrhythmia (**physiological**)

extrasystoles (ES) single, coupled (bigeminy, trigeminy)

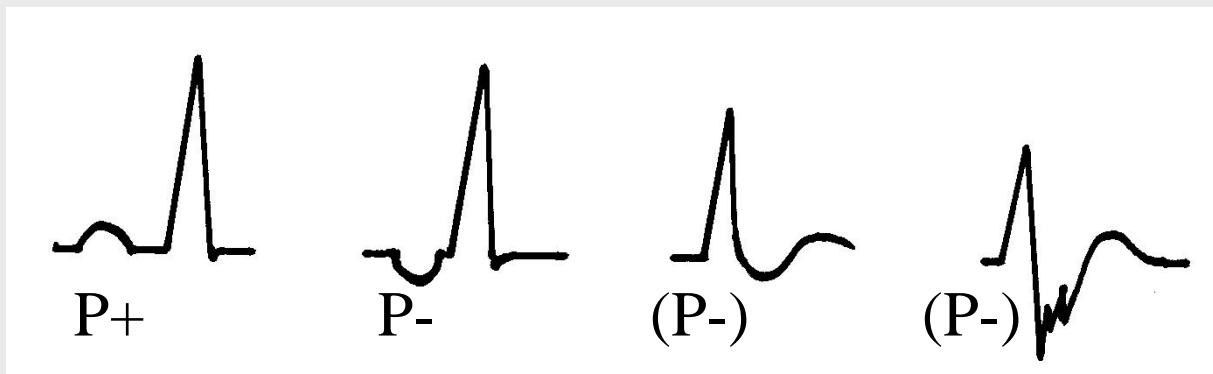

sinus, atrial, junction, ventricular

- Sick sinus syndrome
- Syncope

ARHYTMIAS

SITE OF ORIGIN

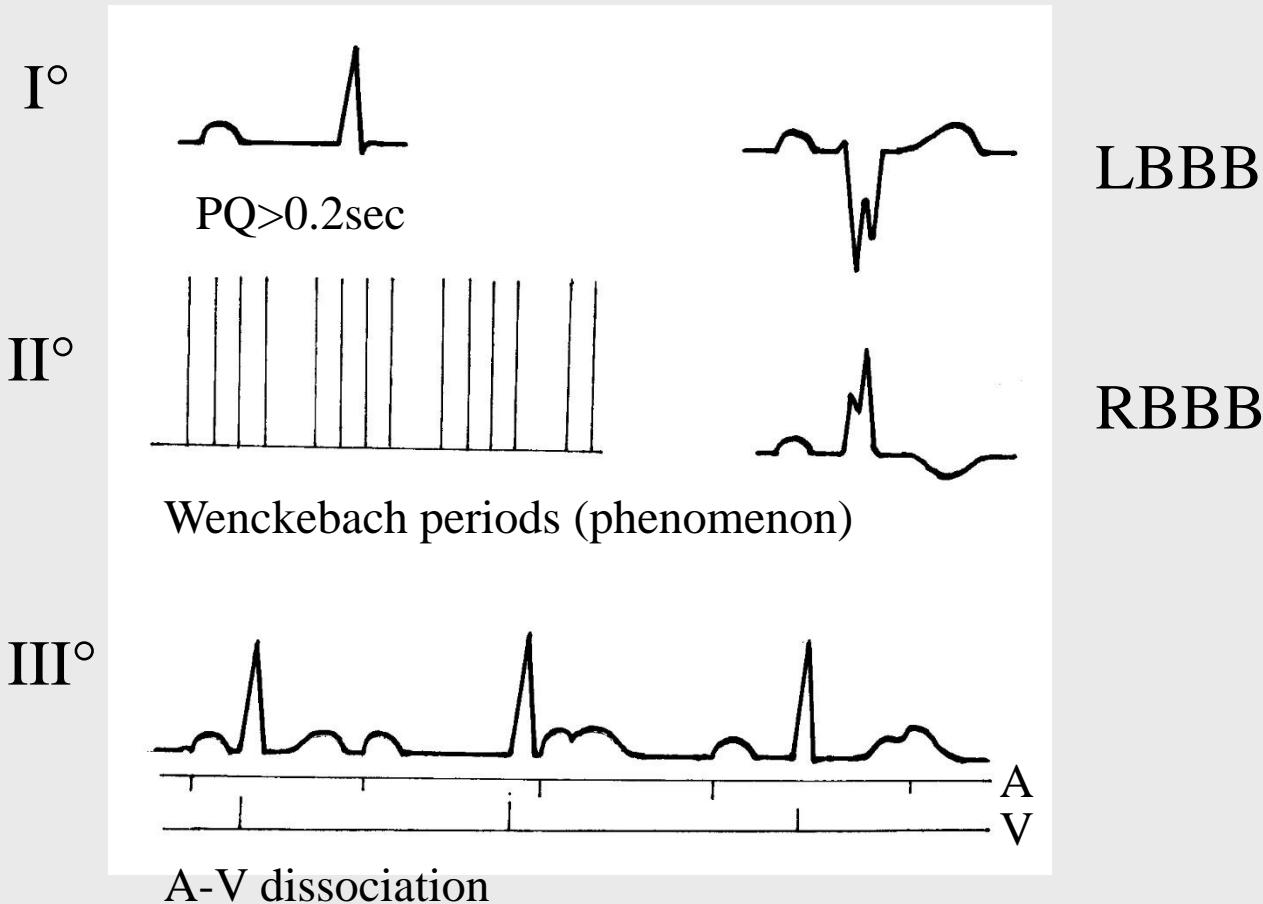

SINUS ATRIA JUNCTION VENTRICLES

- Polarity of P wave
- PQ interval (QP)
(physiological PQ interval: 0.12 – 0.2 s)

BLOCKS

- SICK SINUS SYNDROM
- AV BLOCKS

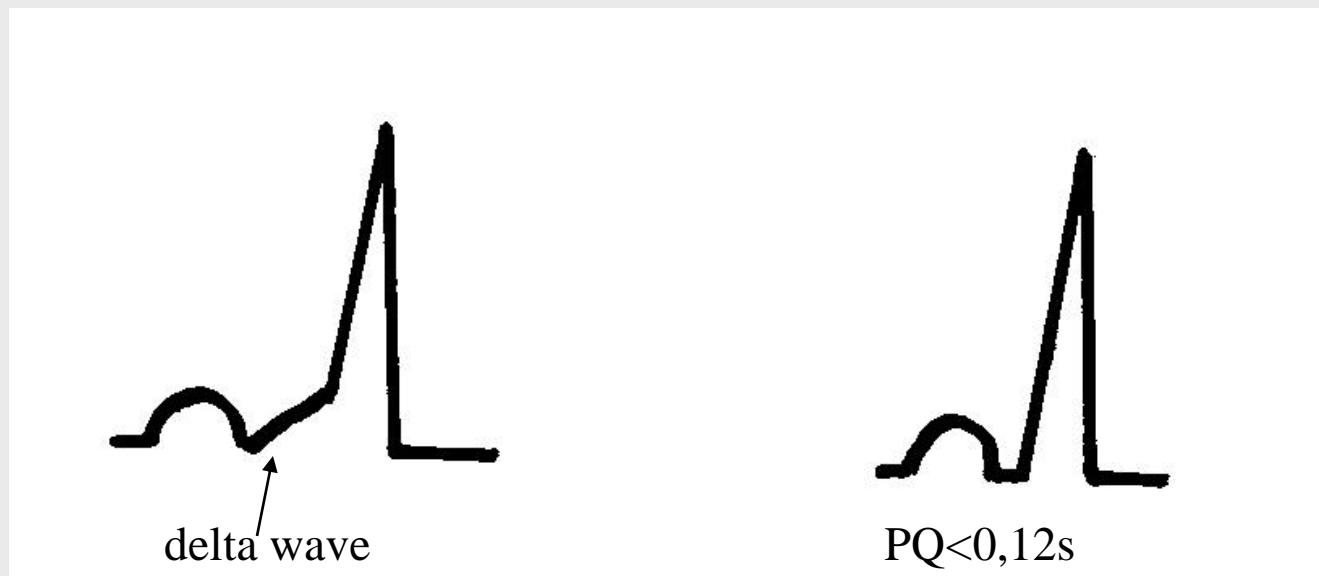

- BUNDLE BRANCH BLOCK (BBB) – LEFT, RIGHT**

PREEXcitation

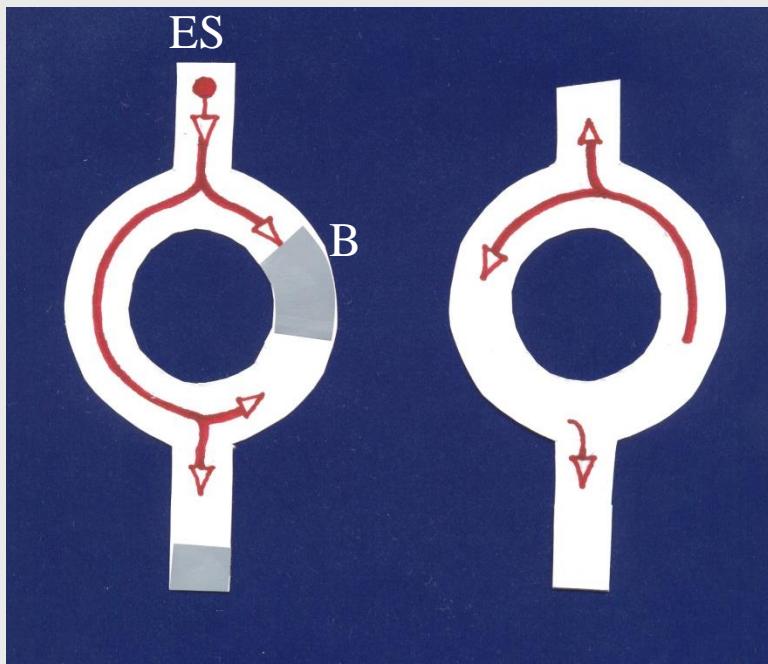

AV node is „by-passed“, fast conduction

- „short nodus“
- Wolf-Parkinson-White syndrome (WPW) – sensitive to paroxysmal tachycardia – see re-entry

REENTRY

Common mechanism of (paroxysmal) tachycardias, extrasystoles, bigeminy, etc.

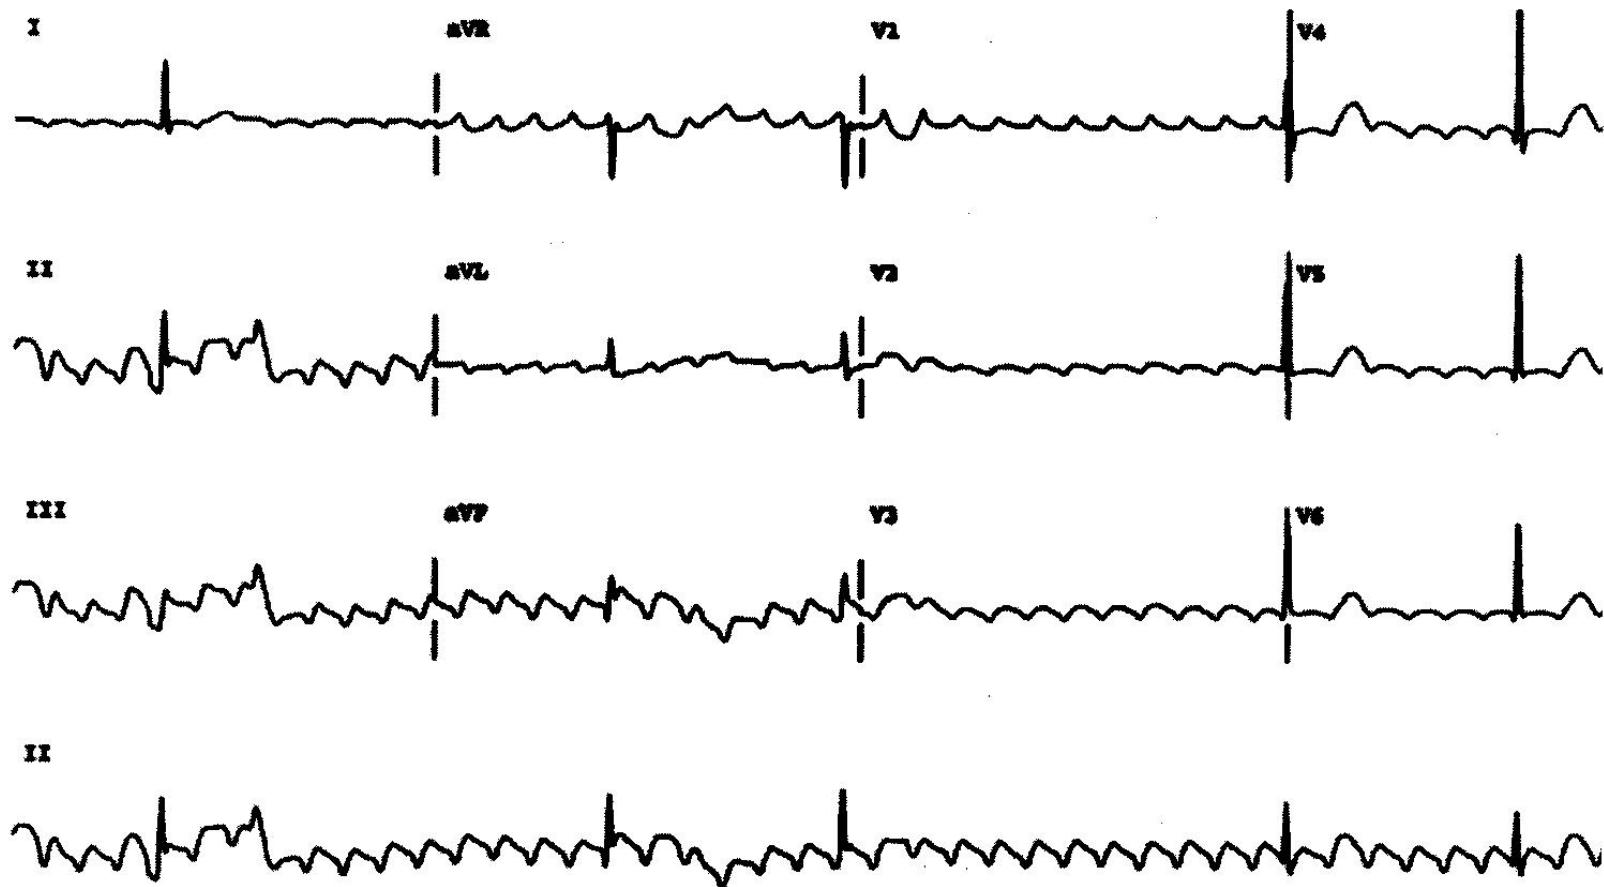

- Double pathway
Diverging and converging of excitation pathways
- Unidirectional block
 - 1. Long refractory period
 - 2. Slowed conduction
 - 3. Reentry

- Loops most often at the level of AV junction
- Determinants of re-entry:
 1. Proper dimension of the loop
 2. Proper timing of the trigger ES

TACHYRHYTHMIA

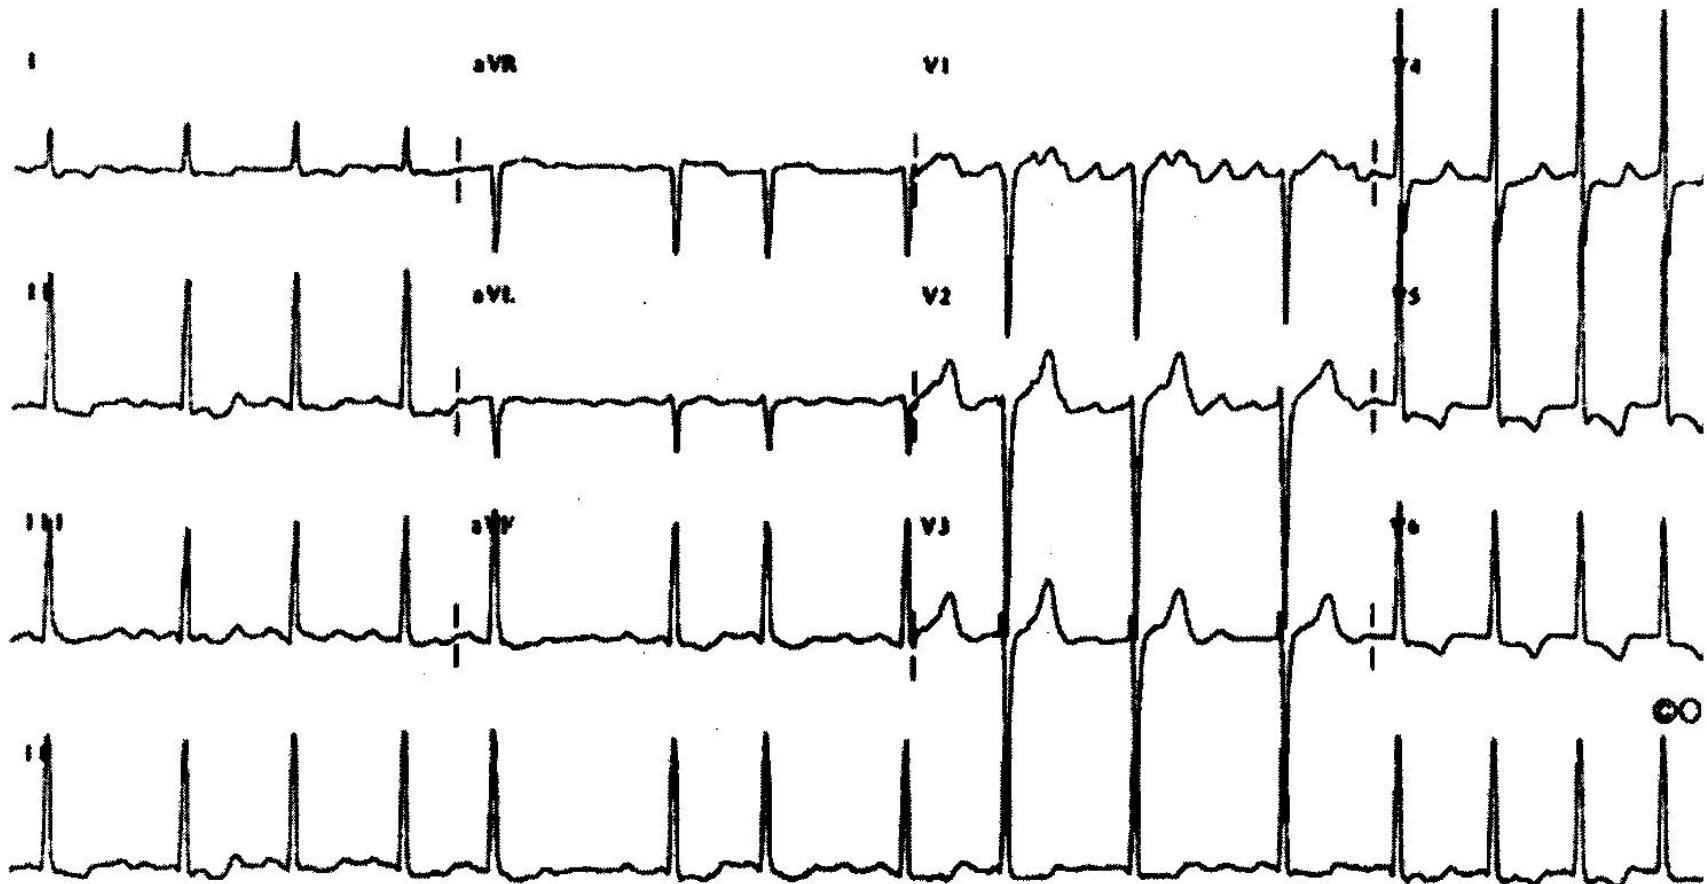

- **SINUS TACHYCARDIA**
- **PAROXYSMAL TACHYCARDIA** (supraventricular, ventricular)
- **FLUTTER** (>250/min; atrial)
- **FIBRILLATION** (>600/bpm; **atrial, ventricular**; breakdown of electrical homogeneity)

ATRIAL FLUTTER

Frequency 250 – 600/bpm
Atrioventricular block n:1

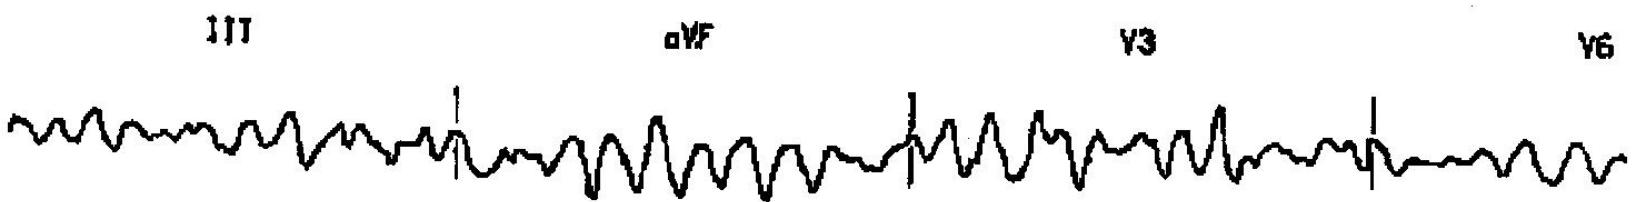

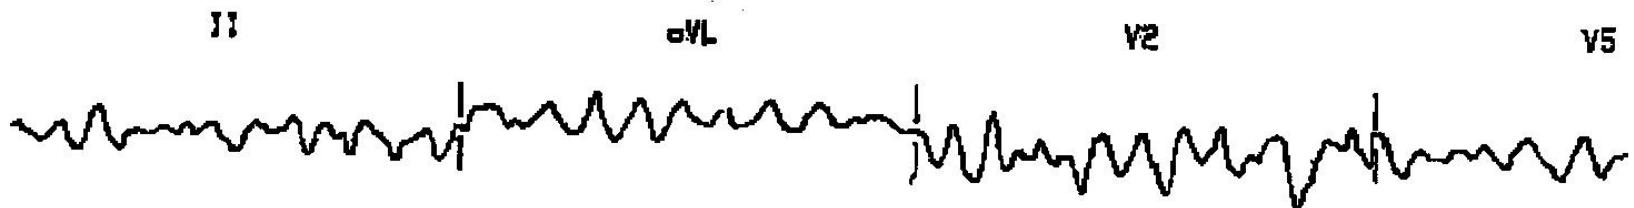

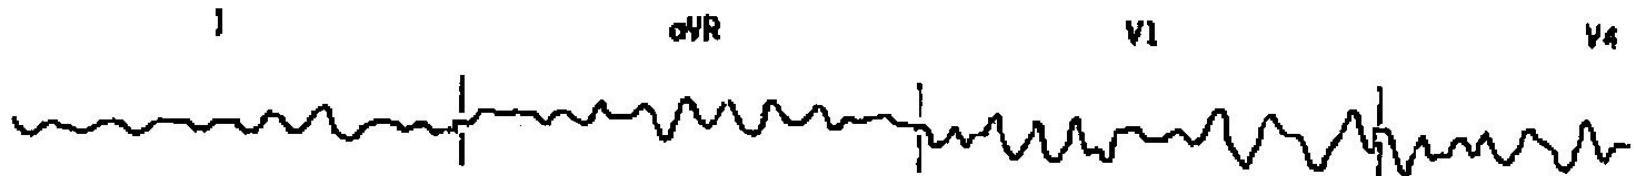

ATRIAL FIBRILLATION

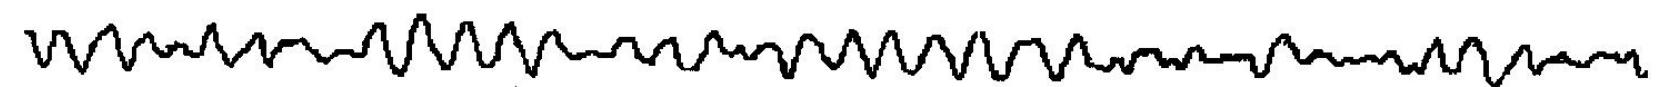

Irregular ventricular rhythm

+ f-waves

VENTRICULAR FIBRILLATION

RHYTHM STRIP: 11.
25 mm/sec; 1 cm/mV

C 00000-0000

F 4

Frequency above 600/bpm, LETHAL

ANTIARRHYTHMICS

- BLOCKERS OF Na CHANNEL – prolong inactivation of I_{Na} , e.g. refractoriness, „block“ fast ways
- BLOCKERS OF Ca CHANNELS – „block“ fast ways
- BLOCKERS OF K CHANNEL – prolong refractory period
- β -SYMPATOLYTICS – slowing of heart rate
