

# **Experimentally induced acute radiation syndrome in experimental animal**

# What is ionizing radiation?

**particles or electromagnetic radiation**, where the particles / photons carry enough energy to ionize atoms and molecules (by removing the electron from their orbit).

It produces electrically charged particles (= ions)

Ionization is biologically very important in macromolecules that are encompassed within the human body.

# Types of ionizing radiation?

$\alpha$  =  $\alpha$ -particles (atoms of helium)  
 $\beta$  = electrons or positrons  
 $\gamma$  = electromagnetic radiation (photons)  
neutrons

# Units?

the dose of ionizing radiation received by a person is expressed as absorbed energy, the unit being gray (Gy)

$1\text{Gy} = 1\text{ J / kg}$  (formerly rad)

same dose in Gy of different types of radiation causes different biological effect (1Gy  $\alpha$  -radiation has greater effect than 1Gy  $\beta$  - radiation)  $\rightarrow$  radiation effect is expressed as effective dose, unit is sievert (Sv)

irrespective of the type of radiation, 1 Sv leads to the same biological effect

example:  $1\text{Gy} = 1\text{Sv}$  for  $\beta$  - or  $\gamma$  radiation,  $1\text{Gy} = 10\text{Sv}$  for neutrons and  $1\text{Gy} = 20\text{Sv}$  for  $\alpha$ -radiation

rate of radioactive decay of radioactive material expressed by units of becquerel (Bq)

$1\text{ Bq} = 1\text{ atomic decay / s}$

# What is radioactivity?

most atoms are stable: carbon-12 or oxygen-16

some have an excess of internal energy and decay spontaneously to form new elements = "radioactive decay"

in decay, excess internal energy is released as  $\gamma$ -radiation or particles

# Sources of ionizing radiation?

Natural

cosmic

exposure increases with altitude

solar

especially  $\gamma$ -radiation

terrestrial resources

radioactive decay of natural radioisotopes  
(soil and rock)

Radon

gas, formed by decay of Radio-226 (from uranium)

has the largest share of the total. dose of ionizing radiation

Artificial

medicine

diagnostics, therapy, sterilization

industry

nuclear energy production

agriculture

# Biological effects and consequences of ionizing radiation?

Direct ionization of macromolecules  
Indirectly through "radiolysis" of water

free oxygen radicals

Consequences:

cycle blockade → apoptosis

mitotic or post-mitotic death

(proliferating cells)

mutation (gene or chromosome)

reparation

unrepaired change

# Types and consequences of DNA lesions?

point mutations

DNA repair: mismatch repair

Single Strand Breaks (SSB)

DNA repair: base excision repair

Double Strand Breaks (DSB)

lethal (apoptosis)

DNA repair: homologous recombination

(sometimes)

sometimes non-homologous repair

translocation

insertion

# DNA repair

(*in situ* repair)

- base excision repair
- nucleotide excision repair
- mismatch repair

# Character of biological effect

## Deterministic

severity depends („is determined by") on the dose  
specific manifestation  
damage to typical tissues and organs  
the effect occurs only when the threshold dose is exceeded  
damage is due to the death of a large number of cells  
onset of symptoms soon after exposure (short latency)  
Types:  
acute radiation syndrome (ac. radiation sickness)  
whole-body irradiation with a dose  $> 1\text{Gy}$   
chronic post-radiation syndrome (general or local)  
sterility, cataract, radiation dermatitis, alopecia, endarteritis obliterans, pneumonitis, ...  
fetal damage in utero

## Stochastic

probability increases with dose (not severity!)  
non - specific manifestation  
damage to various tissues and organs  
a smooth risk increase without a "safe" threshold dose  
single cell damage is sufficient  
delayed manifestation (long latency, typically years)  
Types:  
somatic mutations - tumors  
leukemia, št. gland, lungs, ml. gland, skeleton  
germinative mutations (oocyte, sperm) - congenital genetic defect

# Deterministic × stochastic

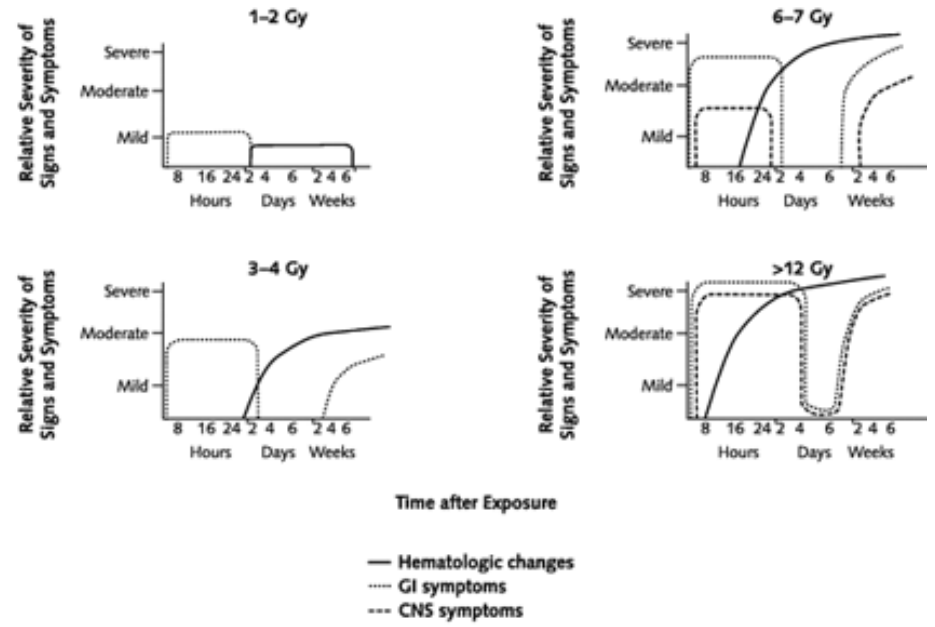

# Acute radiation syndrome

it affects the hematopoietic, gastrointestinal and cerebrovascular systems

time course, extent and severity depends by dose – it is a typical deterministic effect !!!

from several hours to several months after exposure

# Acute radiation syndrome

## **Hematopoietic syndrome (> 1Gy)**

- 1) reticulocytopenia, lymphopenia + granulocytosis
- 2) granulocytopenia (immunodeficiency)
- 3) thrombocytopenia (bleeding)
- 4) anemia (hypoxia)

## **GIT syndrome (> 10Gy)**

early (hours) - nausea, vomiting, diarrhea

late (days) - loss of intestinal integrity

malabsorption, dehydration, toxemia / sepsis, ileus, bleeding

## **Cerebrovascular syndrome (tens of Gy)**

headache, cognitive impairment, disorientation, ataxia, convulsions, exhaustion and hypotension

## **Cutaneous**

erythema, burns, edema, impaired wound healing  
epilation

# Hematopoietic syndrome

irradiation of bone marrow ( $> 1\text{Gy}$ )  
leads to exponential cell death -  
hematological crisis  
hypoplasia to pulp aplasia + peripheral  
pancytopenia (infection, bleeding)  
subpopulation of stem cells. it is  
selectively more radio-resistant  
(probably due to the prevalence of  $G_0$  in  
the  $G_0$  phase)  
necessary for regeneration  
anemia is a late consequence  
(erythrocytes  $\sim 120$  days)!  
massive stress reactions  
(glucocorticoids) contribute to  
lymphopenia (cytolytic effect) and  
paradoxically delay the onset of  
granulocytopenia (release of stocks of  
granulocytes from the pulp and spleen)

**THE UKRAINIAN WEEKLY**  
Published by the Ukrainian National Association Inc., a fraternal non-profit association

Vol. LXIV No. 16 THE UKRAINIAN WEEKLY SUNDAY, APRIL 21, 1986 \$1.25/\$2 in Ukraine

## CHORNOBYL: THE FIRST DECADE

"An accident has taken place at the Chernobyl power station, and one of the reactors was damaged. Measures are being taken to eliminate the consequences of the accident. Those affected by it are being given assistance. A government commission has been set up."  
-- Announcement of USSR Council of Ministers read on April 28, 1986, on Moscow television.

"At the Chernobyl atomic energy station there was an accident that led to the ruin of a portion of the building housing the [fourth] reactor and to some release of radioactive materials. As a result of the accident, two people have died. The radiation situation at the CAES, as well as surrounding areas, is stabilized."  
-- Report in Pravda Ukraine on April 30, 1986.

The destroyed fourth reactor of the Chernobyl nuclear power plant as photographed soon after the April 26, 1986 disaster by Andrey Il'ich.

Super quick explanation of the what the Chernobyl nuclear disaster and reactor number 4 including it's timeline of events in the seconds and minutes and days following April 26<sup>th</sup>, 1986 and what radioactivity is

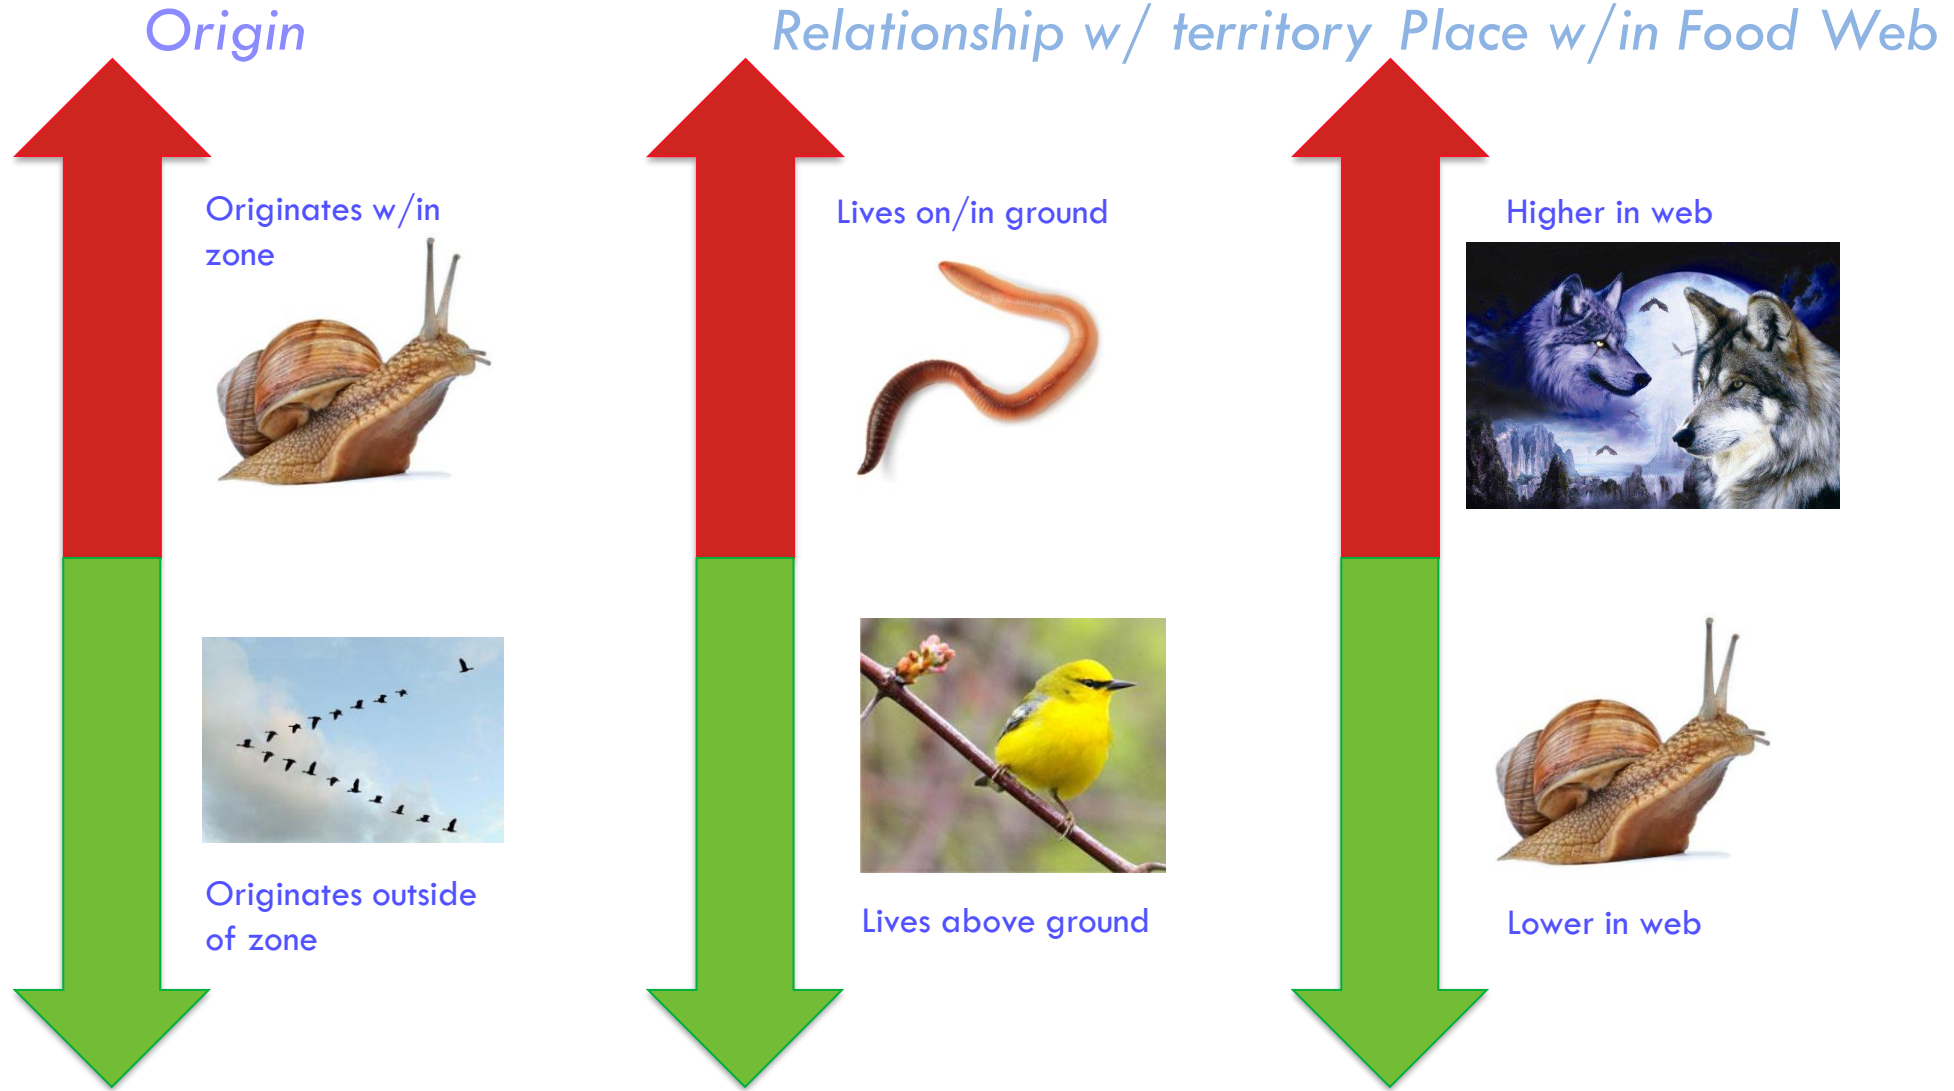

# Bioaccumulation

Practical:

**EXPERIMENTALLY INDUCED  
ACUTE RADIATION SYNDROME IN  
EXPERIMENTAL ANIMAL**

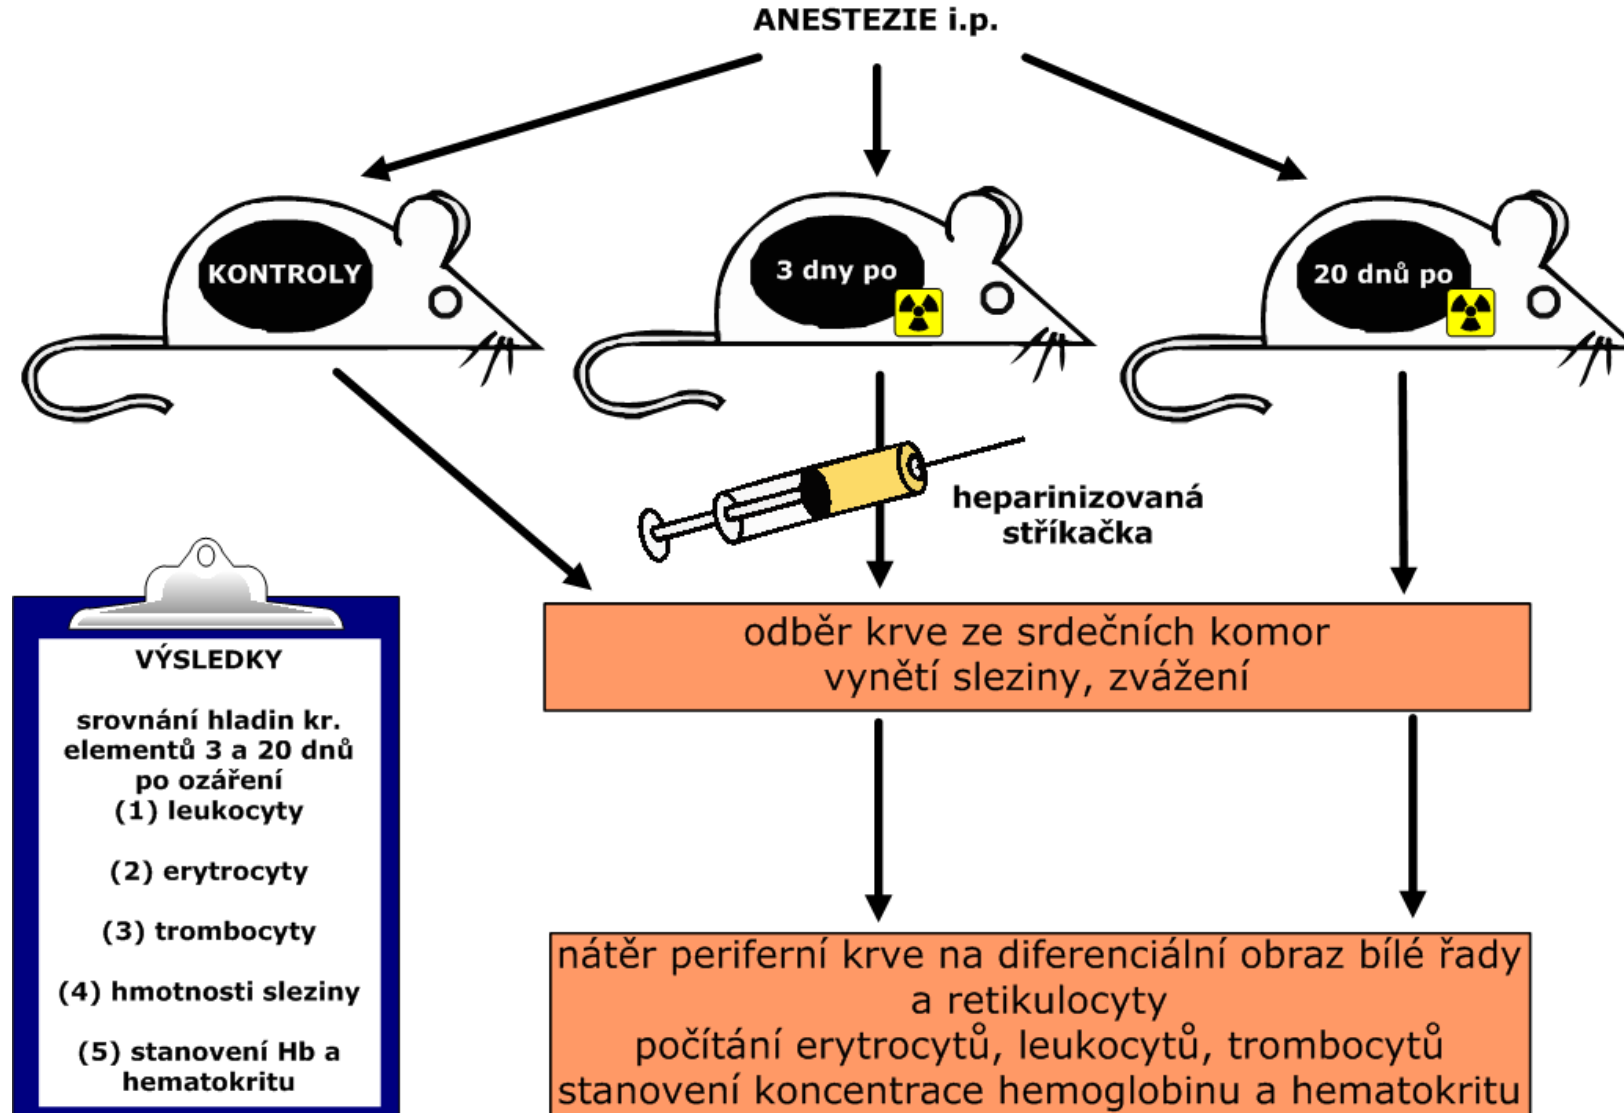

# Aim of the practical

to document the deterministic nature of radiation effects on the practical examples

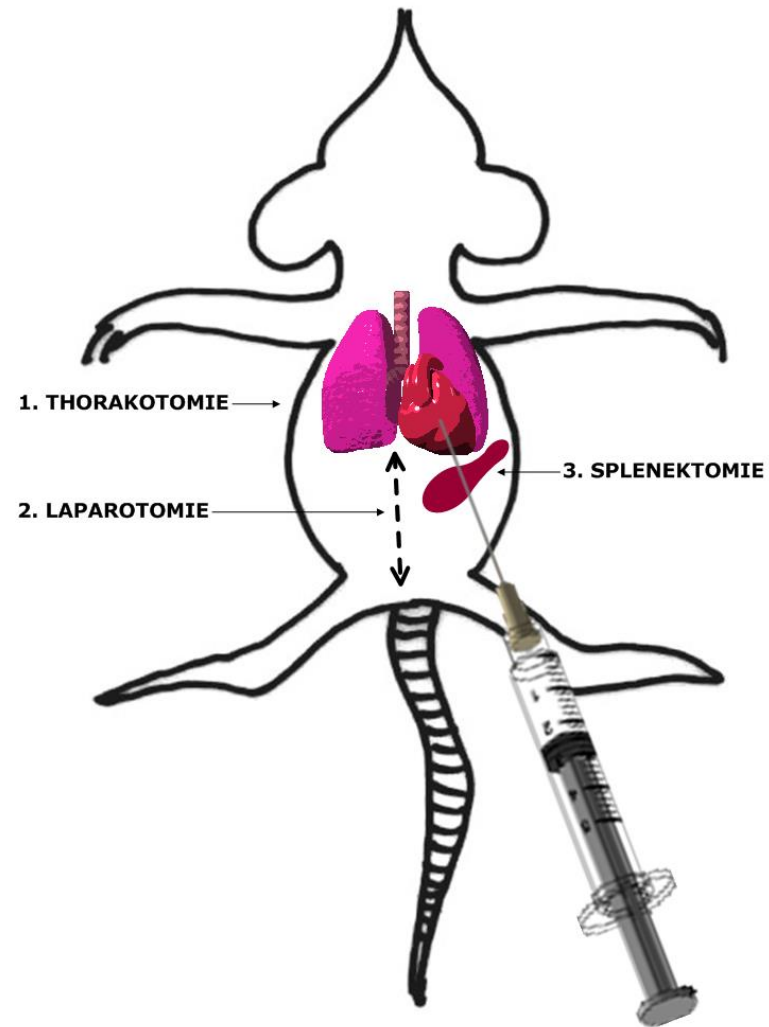

to monitor the dynamics of peripheral blood count changes as a result of the bone marrow

acute radiation syndrome is a model situation on which the principle of hematopoiesis regulation can be demonstrated

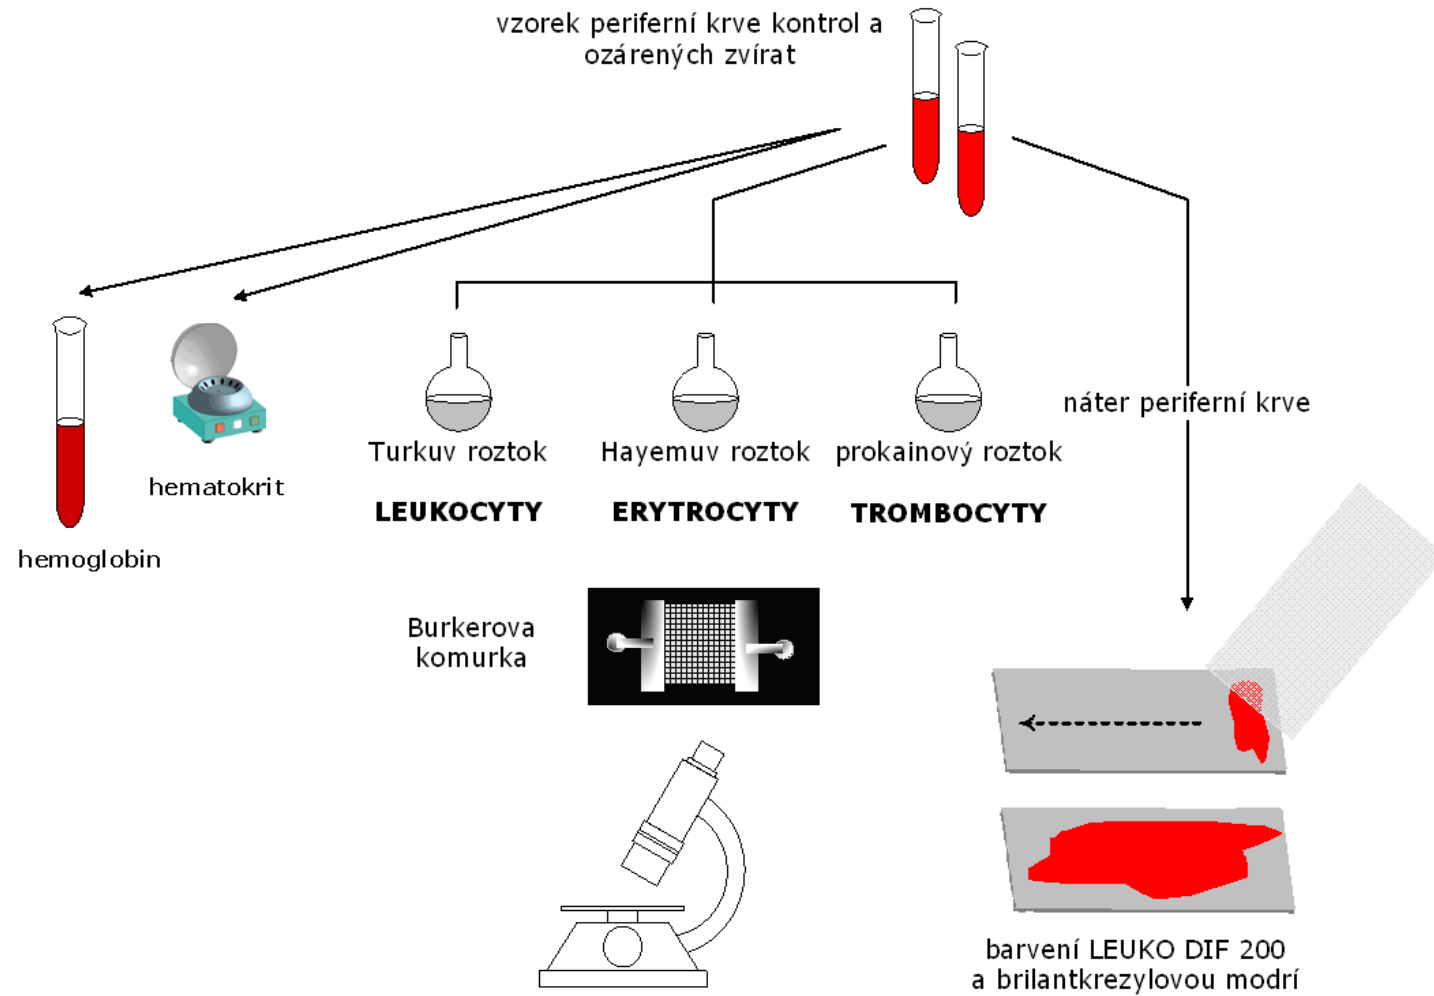

# Practical experiment I - design

# Practical experiment I – surgery technique

# Practical experiment I - evaluation

# Effects of ionizing radiation on haematopoietic tissue

Practical experiment II – evaluation of peripheral blood smears

# Control questions

What is ionizing radiation?

What is radioactivity?

How are the biological effects of ionizing radiation mediated?

Types of biological effects of radiation + examples?

# Hematopoiesis

# Hematopoiesis = bone marrow

bone marrow

(1) haematopoietic cells.

(2) hematopoietic stroma - essential for normal production of blood cells.

fibroblasts, adipocytes, macrophages, T-lymphocytes: connective tissue, fat

own hematopoietic bb. - tribal bb.

pluripotent hematopoietic stem cell

differentiation into all series + self-renewal !!!

unclear phenotype - antigen classification CD34 + in the pulp <0.01%

progenitor (determined) stem bb.

do not have long-term self-renewal ability

unclear phenotype - classification according to the ability to form colonies (CFU-E, CFU-M, CFU-G, CFU-Meg,...)

blood precursors bb.

clear phenotype (morphology, histochemistry)

in medulla ~ 90%

proerythroblast - basophilic erythroblast -

polychromatophilic erythroblast - orthochromic

erythroblast - reticulocyte - erythrocyte

myeloblast - promyelocyte - myelocyte -

metamyelocyte - granulocyte (rod)

promonocyte - monocyte

megakaryoblast - megakaryocyte

mature elements

# Stem cells

basic properties of KB are  
self-renewal  
division without differentiation  
(asymmetric)  
production of specialized bb. (tissue  
regeneration)  
KB types  
mature KB (pluripotent)  
adult, somatic  
individual KBs give rise to a limited  
repertoire of bb.  
eg haematopoietic KB,  
mesenchymal KB,...  
early KB (toti- / omnipotent)  
embryonic (blastocyst)  
they give rise to all types of body  
cells  
they are the only ones that do not  
need growth factors to stimulate  
division, in all others the cell cycle is  
initiated by mitogens

# Stem cells

## Hierarchy of Stem Cells

# Somatic stem cells

located in most body tissues as a source of cells for constant self-renewal and replacement  
they are pluripotent  
give rise to all bb. of a specific type of tissue, but not another (this is only the ability of embryonic KB)  
however, it appears that some universality is possible

# Regulatory factors

interplay of autocrine,  
paracrine and endocrine  
factors  
endocrine  
erythropoietin (kidney)  
thrombopoietin (liver)  
cytokines  
para- / autocrine  
hematopoietic growth  
factors (cytokines)  
produced by stromal cells,  
eg CSFs (colony-stimulating  
factors)

# Erythropoietin (EPO)

HIF-1 $\alpha$  regulation by proline hydroxylation

90% oxygen in the body is used for ox. phosphorylation - ATP production  
 oxygen is relatively insoluble in water - Hb allows 100- more oxygen to be transported by blood than would be possible only in physically dissolved form  
 EPO is hl. regulator conc. Hb and hence oxygen availability  
 1893 - alpine environment leads to increase in Hb in humans – adaptation to hypoxia!  
 1950 - A humoral factor produced by the kidneys stimulating erythropoiesis  
 bilateral nephrectomy in rats led to anemia  
 1977 purification of EPO from the urine of a patient with aplastic anemia  
 1983 cloning of EPO gene - recombinant EPO production (epoetin)  
 long-term treatment of renal failure and some anemia  
 EPO production - peritubular fibroblasts of kidney (deep in cortex and outer cortex)  
 why kidney?  
 phylogenesis - in lower organisms, the kidney is a haemopoietic organ  
 more sensitive sensing of the actual Hb content and hence oxygen (after separation of plasma and circulating elements) at glom. filtration

# Blood count – reference values

	Muži	Ženy
Ery [RBC] ( $\times 10^{12}/l$ )	4.2 – 5.8	3.8 – 5.2
Leu [WBC] ( $\times 10^9/l$ )	5 – 10	
Tromb ( $\times 10^9/l$ )	150 – 400	
hematocrit (%)	0.38 – 0.49	0.35 – 0.46
hemoglobin (g/l)	135 – 175	120 – 168
Mean volume Ery [MCV] (fl)	80 – 95	80 – 95
Average Hb content in ERY [MCH] (pg) <i>MCH = Hb <math>\times</math> 10/RBC</i>	27 – 32	27 – 32
Average concentration of Hb [MCHC] <i>MCHC = Hb <math>\times</math> 100/hematocrit</i>	0.32 – 0.37	0.32 – 0.37
Red Cell Distribution Width [RDW] (%)	11 – 15	

# Peripheral blood cells

# Differential white blood count
