

## MINITASK 5

An 11-year-old boy with normal psychomotor development, normal sickness rate, negative family history

4 weeks ago he endured a Campylobacter infection (confirmed microbiologically) with a benign course

Over the past 3 days progressive weakness of the lower extremities occurred limiting the walk

He's sent by an experienced GP to confirm/exclude the GBS

- A) What does the abbreviation GBS mean and to what larger group of diseases does it belong ?
- B) What clinical neurological findings would support the suspicion for GBS ?
- C) What paraclinical examinations would you recommend and what findings are typical for GBS ?
- D) The first line treatment in GBS ?
