FIRST EVENTS IN HUMAN LIFE

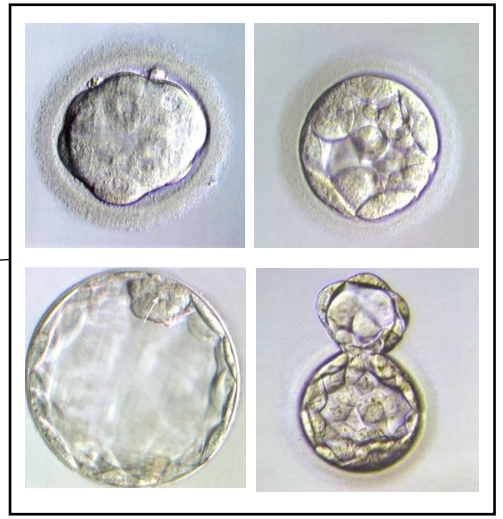
Fertilization

START! 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21

1st week

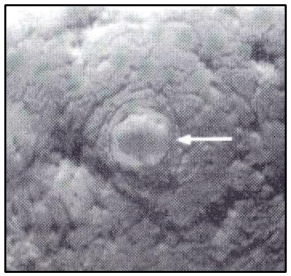
Cleavage

Blastogenesis



Implantation

- Adhesion of blastocyst
- Differentiation of trofoblast
- End of implantation



Embryogenesis

2nd week

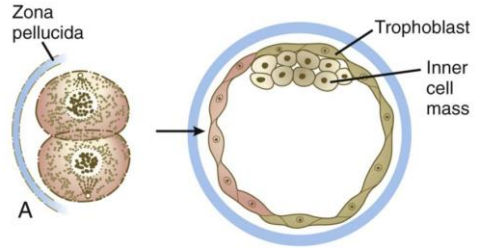
- Differentiation of embryoblast
- **Bilaminar germ disc**
- Amniotic cavity
- Primary yolk sac
- Extraembryonic mesoderm

3rd week

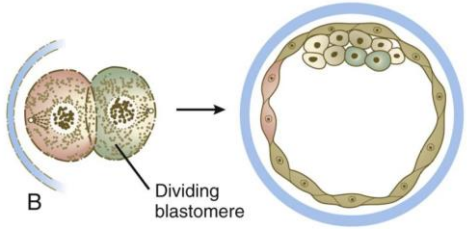
- **Trilaminar germ disc**
- Differentiation of epiblast
- Primitive node and primitive streak
- Differentiation of mesoderm
- Differentiation of ectoderm and neuroectoderm
- Somitogenesis

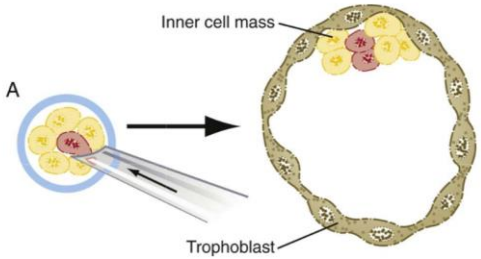
1st week

Mechanism of diferentiation

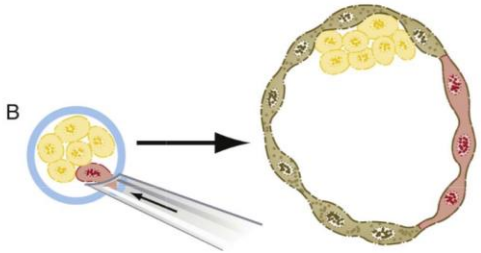


„cell polarity“



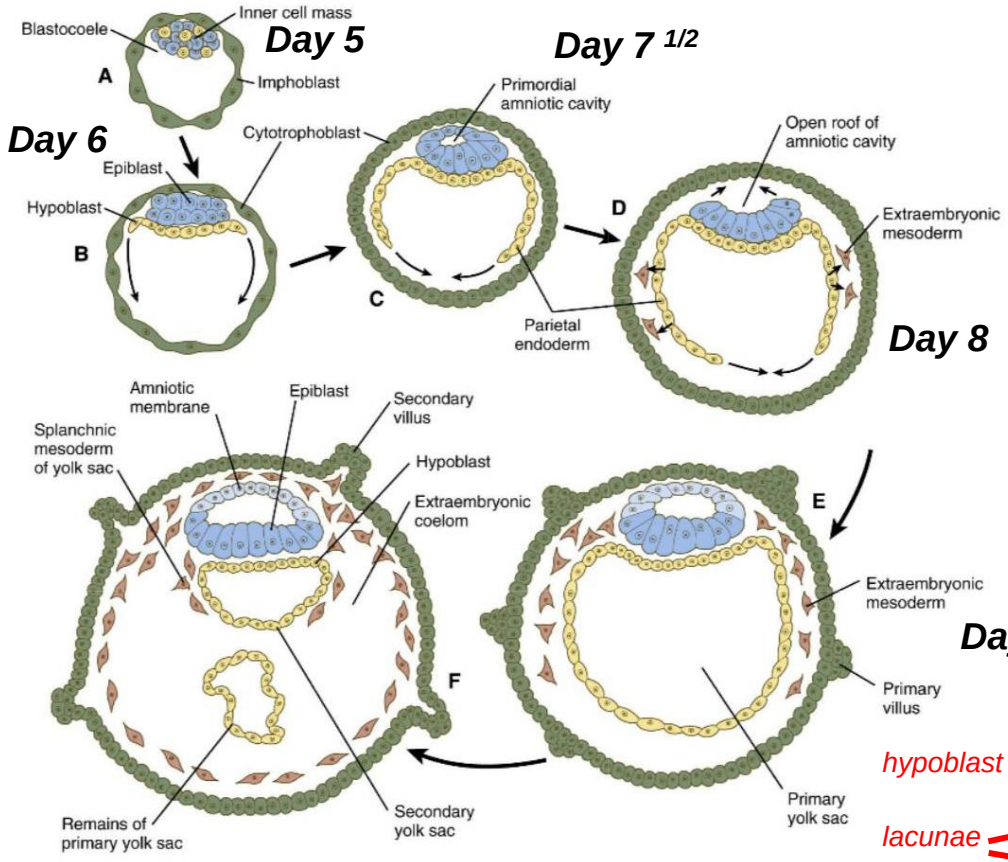


„inside-outside“

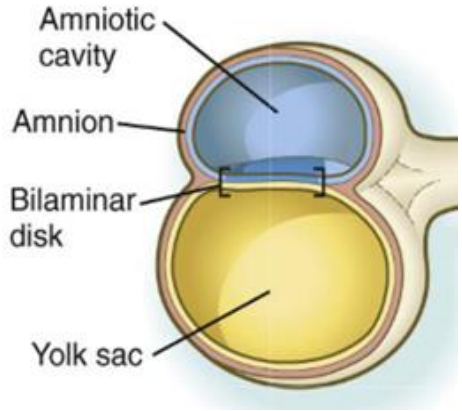


- 16-cell embryo is still totipotent – later (32-cell), it loses the full developmental potential → cell are **determined.**

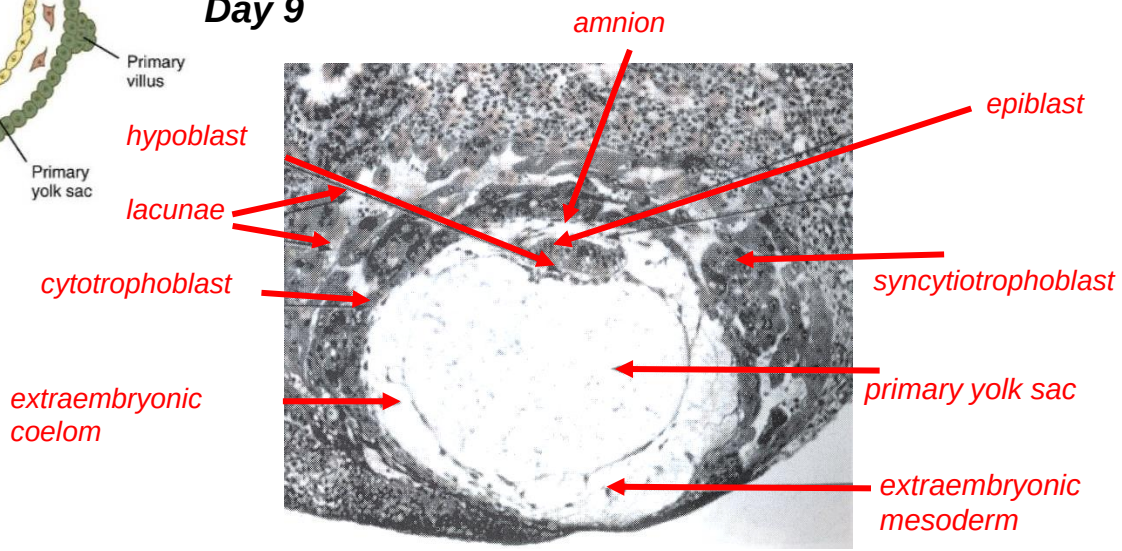
1st-2nd week BILAMINAR GERM DISC



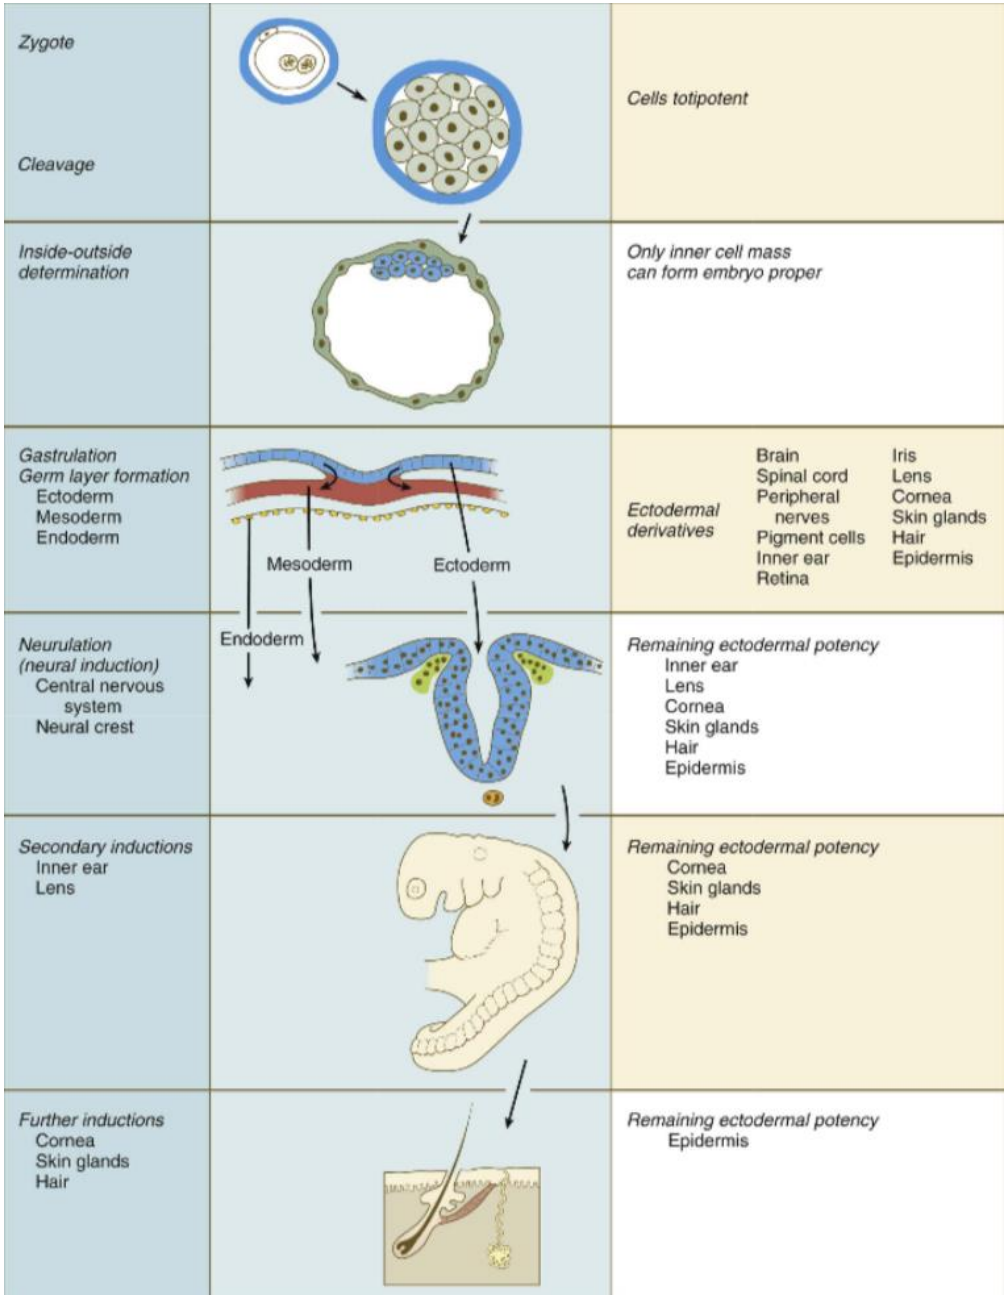
end of 2nd week



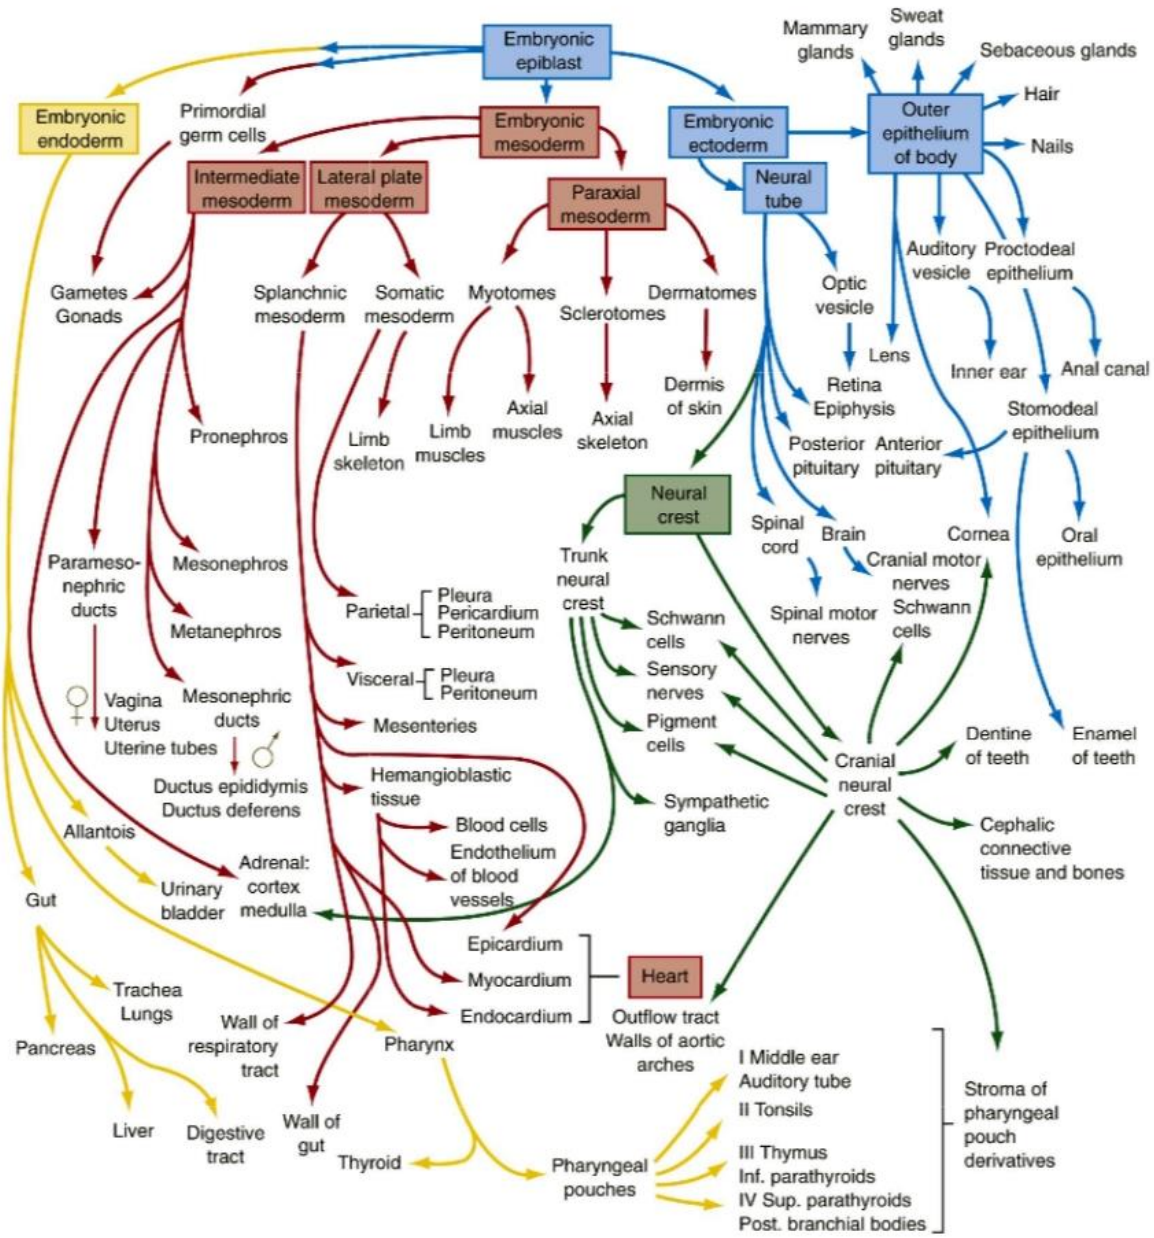
Day 9



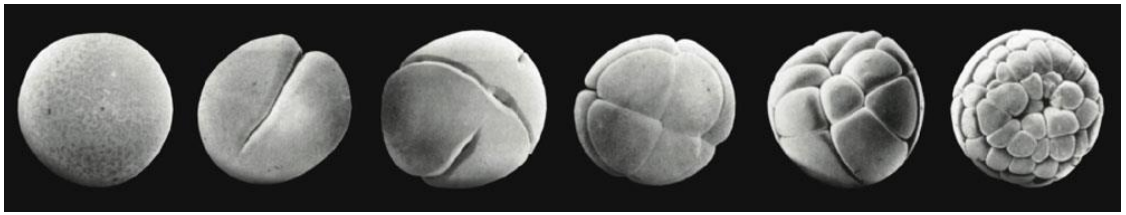
EMBRYONIC INDUCTION AND DETERMINATION

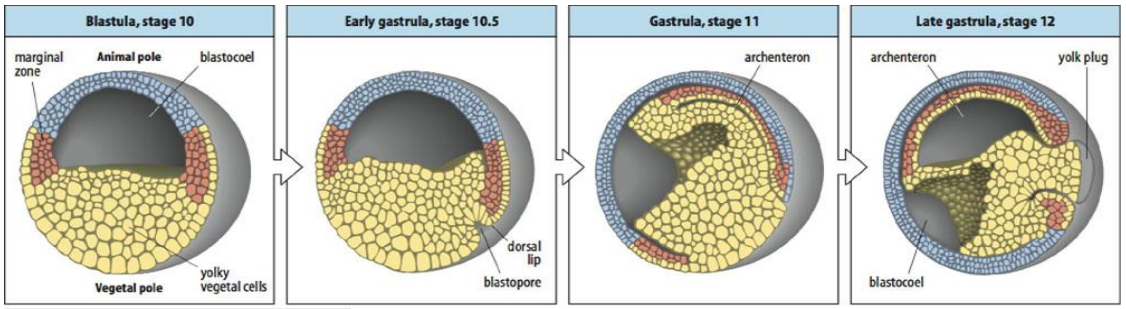


EMBRYONIC INDUCTION AND DETERMINATION DRIVE DEVELOPMENT OF TISSUES AND ORGANS

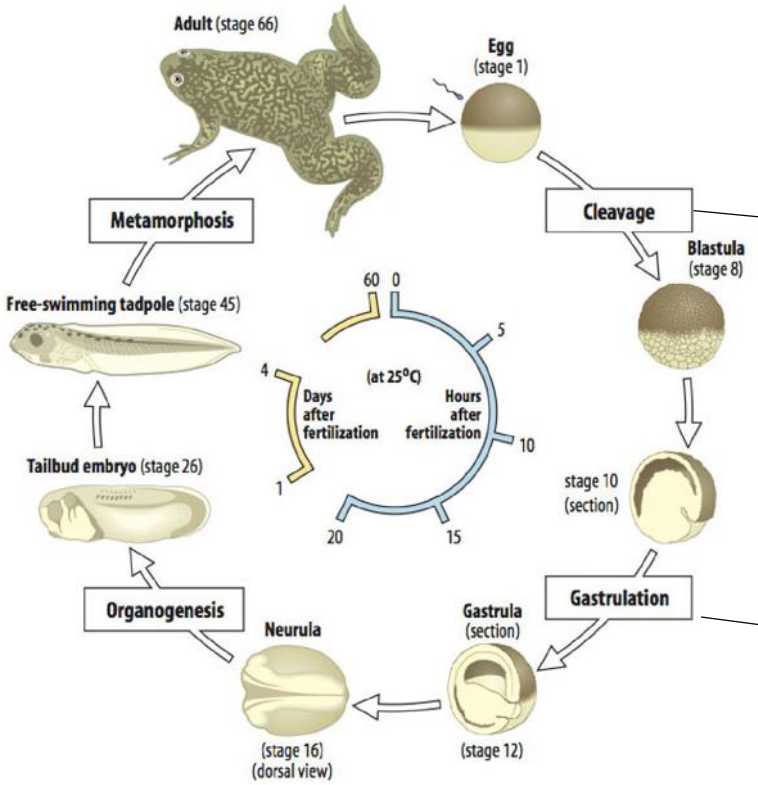


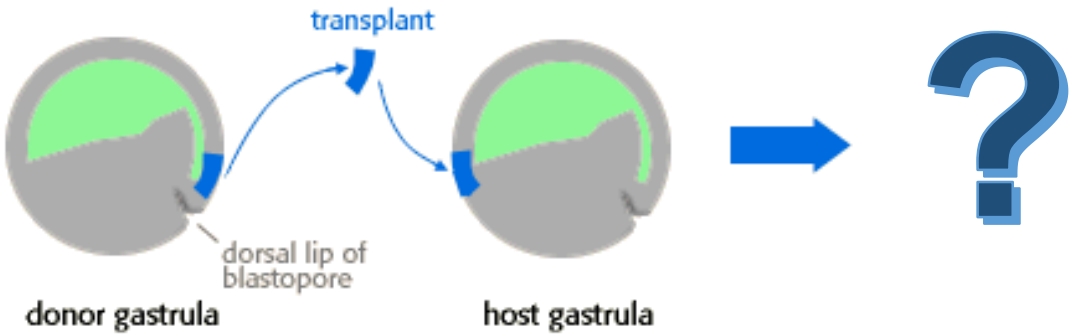
BREAKTHROUGH EXPERIMENT OF HANS SPEMANN AND HILDE MANGOLD 1923





BREAKTHROUGH EXPERIMENT OF HANS SPEMANN AND HILDE MANGOLD





What did they get?

BREAKTHROUGH EXPERIMENT OF HANS SPEMANN AND HILDE MANGOLD

Induction of Embryonic Primordia by Implantation of Organizers from a Different Species

by

HANS SPEMANN and HILDE MANGOLD *(Née Pröscholdt)*

Freiburg i.B.

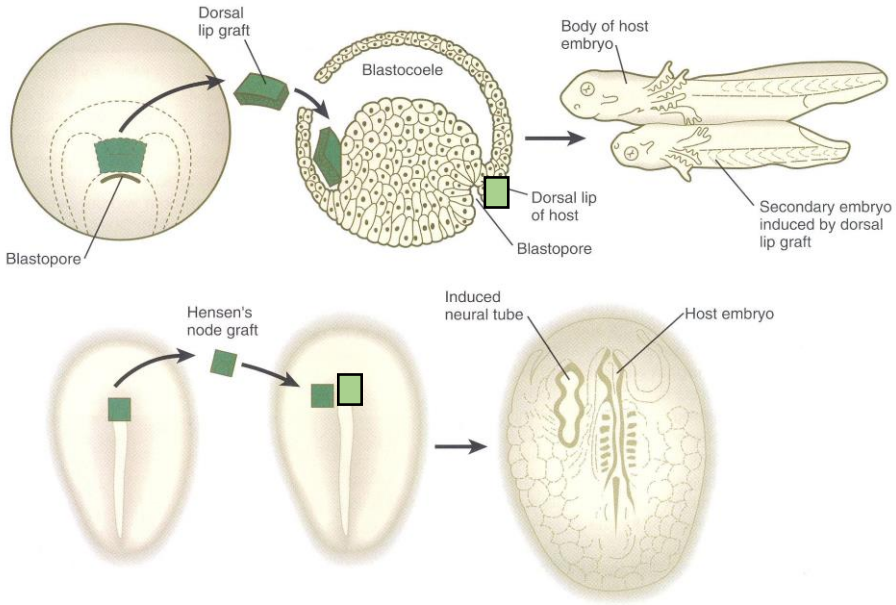
With 25 illustrations

(Submitted 1 June 1923)

„A piece of upper blastopore lip of an amphibian embryo undergoing gastrulation exerts an organizing effect on its environment in such a way that, if transplanted to an indiferent region of another embryo, it causes there the formation of a secondary embryonic anlage. Such a piece can therefore be designated as an **Organizer**.“

SPEMANN'S ORGANIZER

PRINCIPLE OF EMBRYONIC INDUCTION

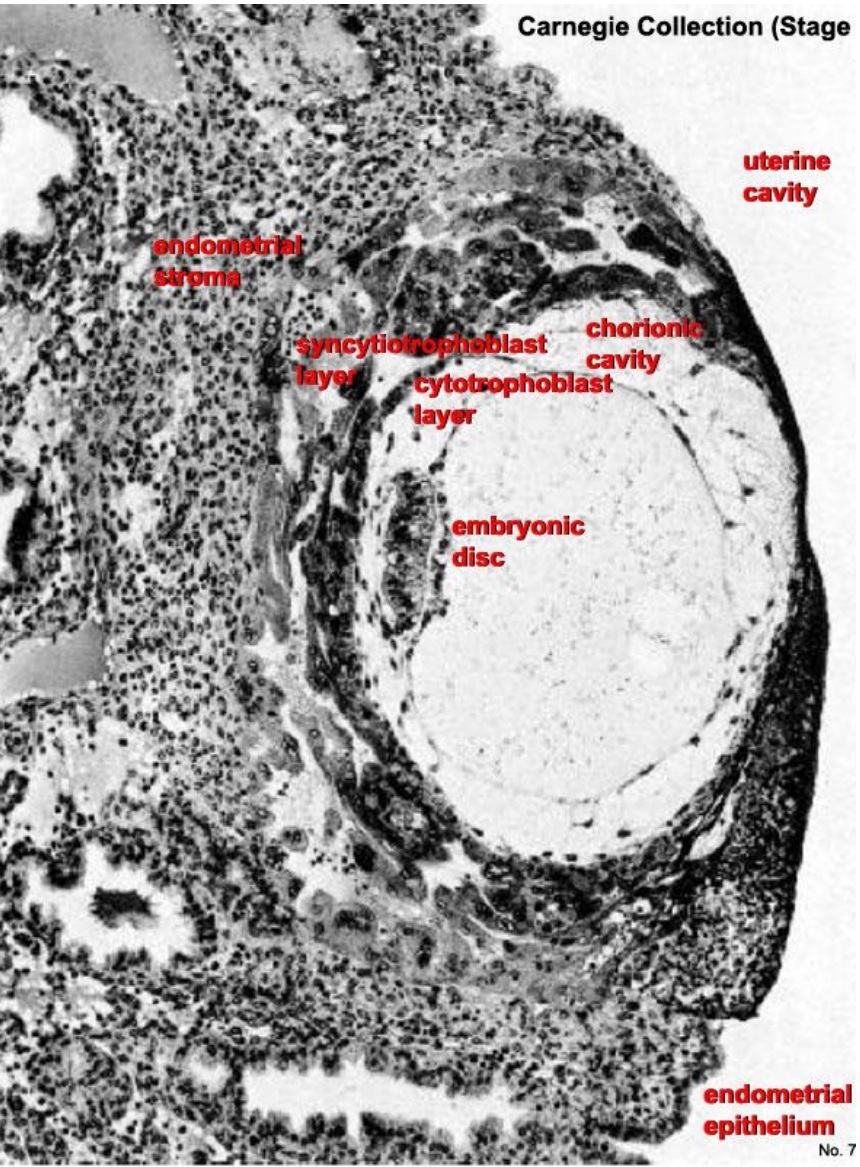


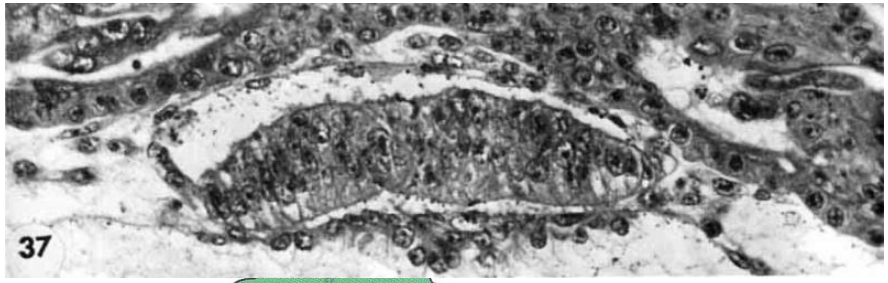
The embryonic „organizer“ stimulates other cells to proliferate, differentiate and make new structures.

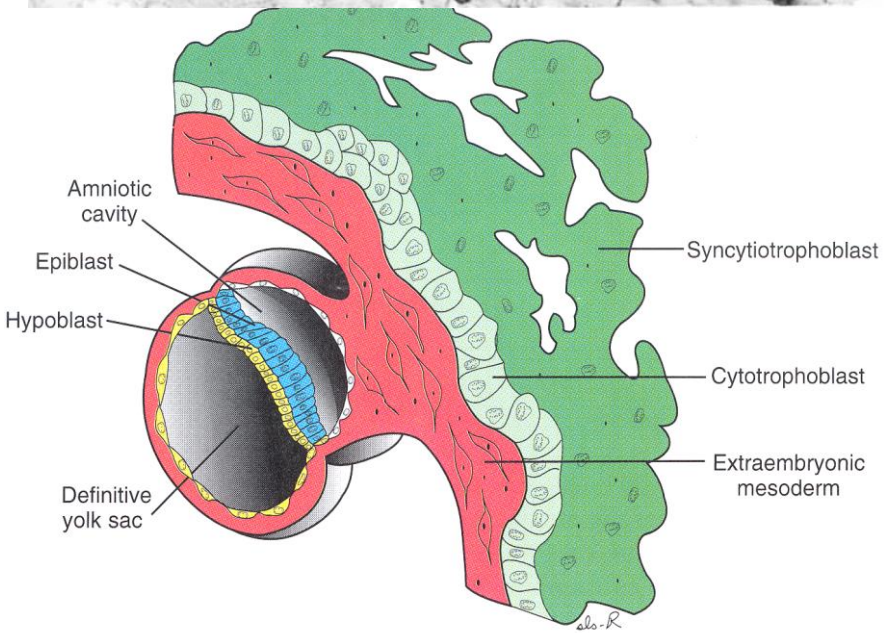
ORGANIZER EXISTS IN MAMMALLS

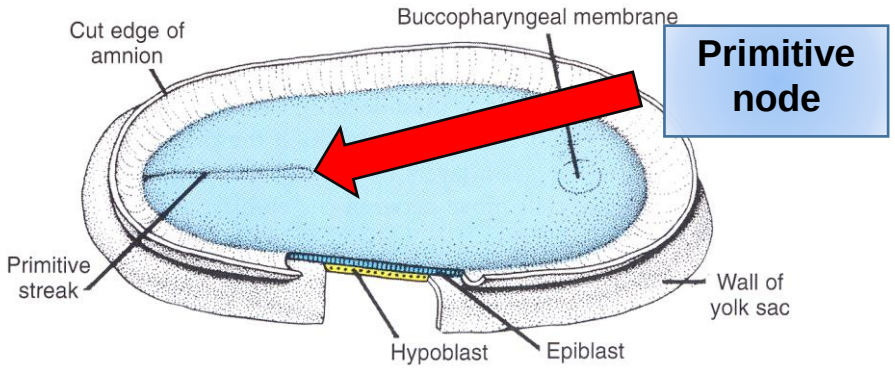
BILAMINAR GERM DISC

2nd week





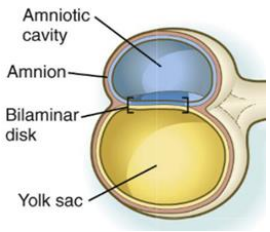




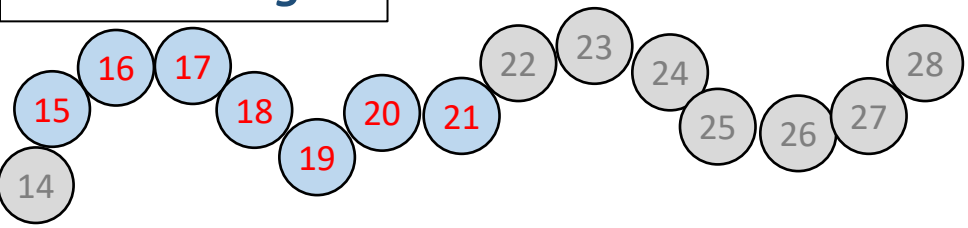
TRILAMINAR GERM DISC

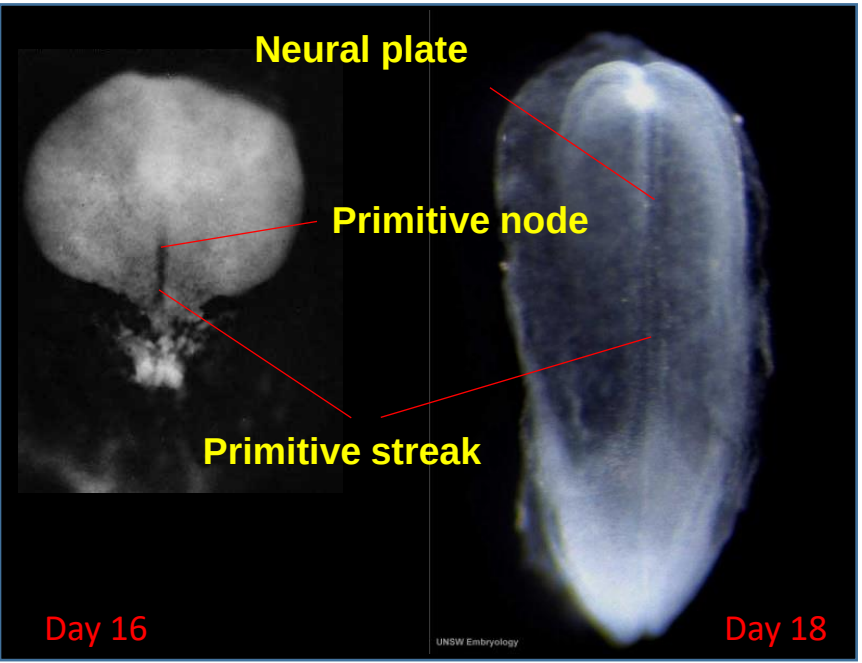
PRIMITIVE STREAK AND PRIMITIVE NODE

2nd week *ends*

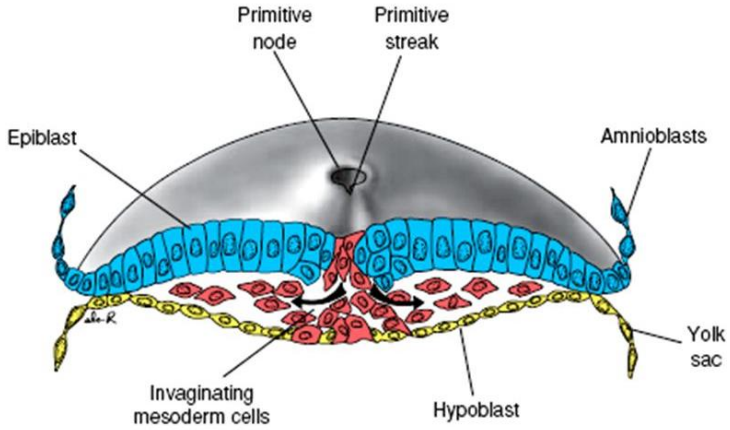


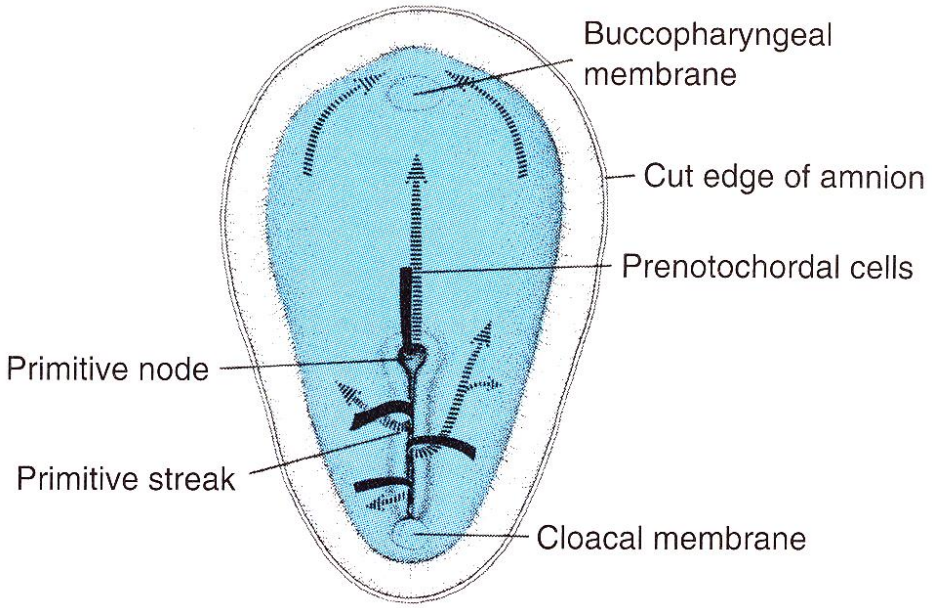
3rd week *begins*





NEW STRUCTURES

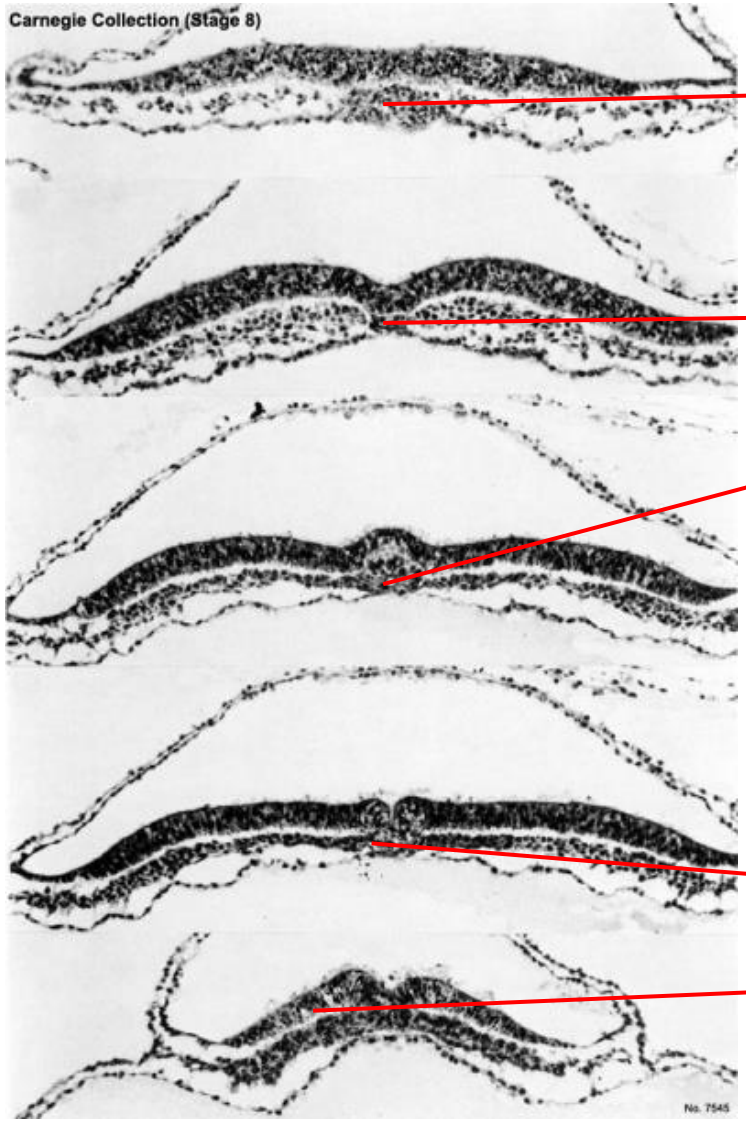




TRILAMINAR GERM DISC

PRIMITIVE STREAK AND PRIMITIVE NODE

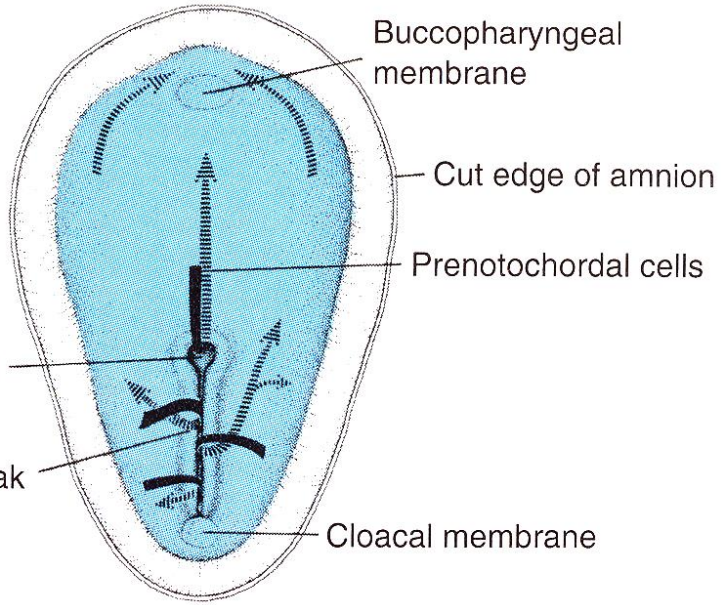
3rd week



Prechordal plate

Neural plate

Notochordal process



TRILAMINAR GERM DISC

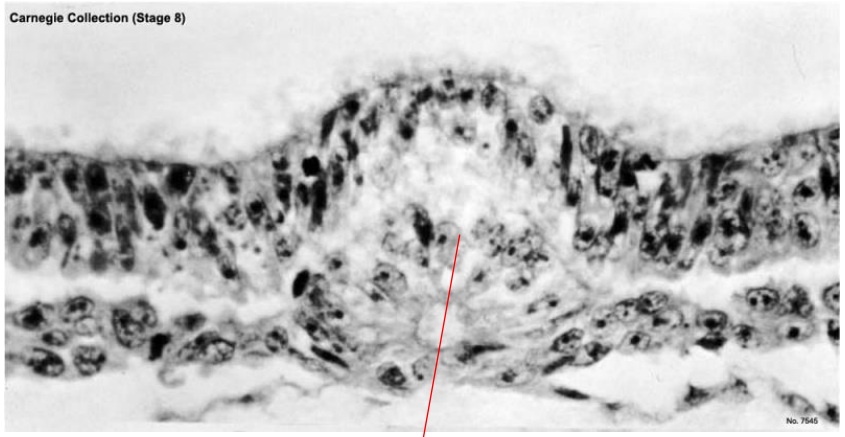
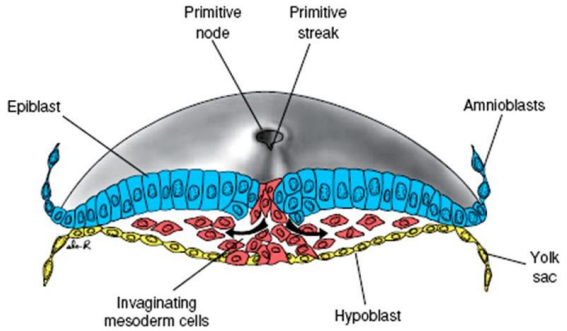
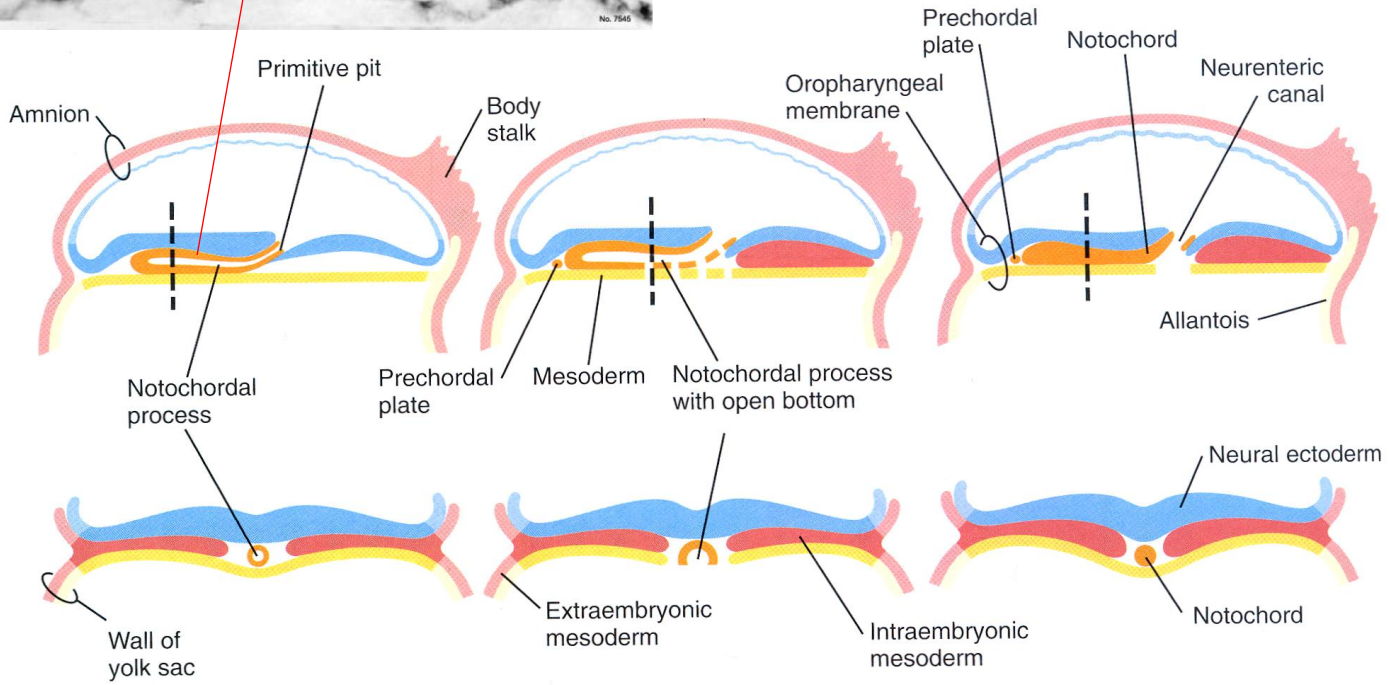
3rd week







TRILAMINAR GERM DISC

PRIMITIVE STREAK AND PRIMITIVE NODE

3rd week

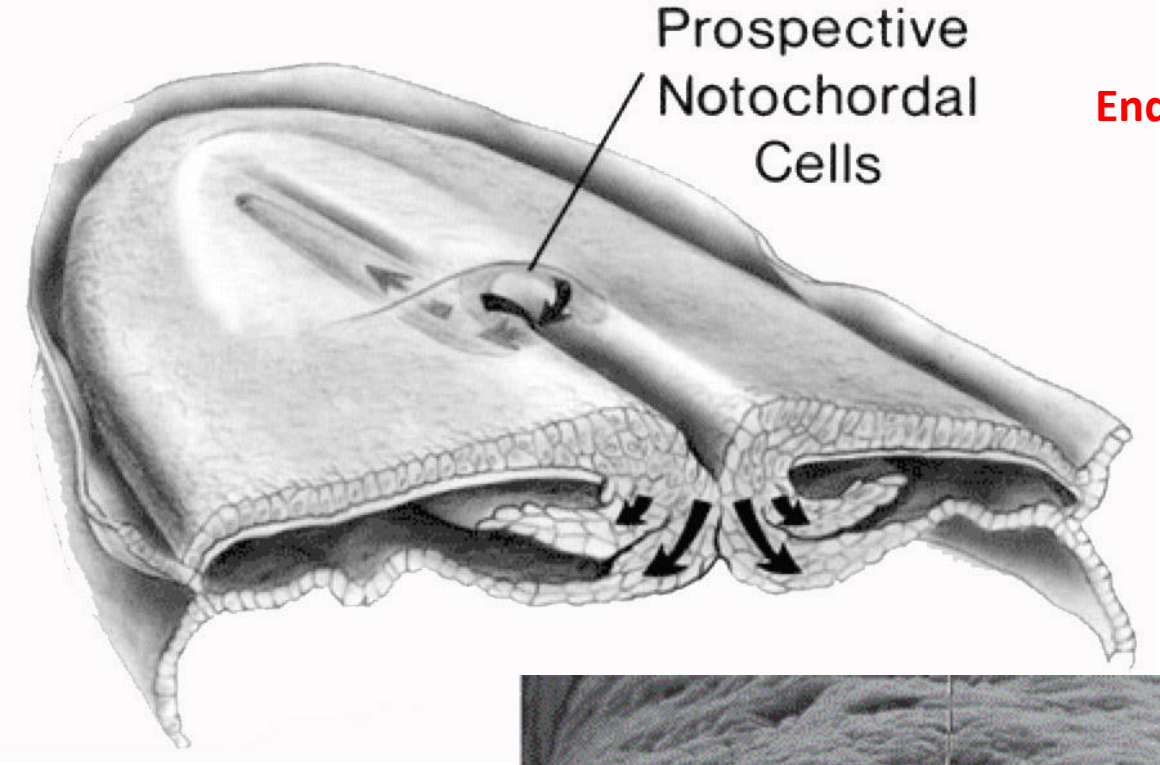
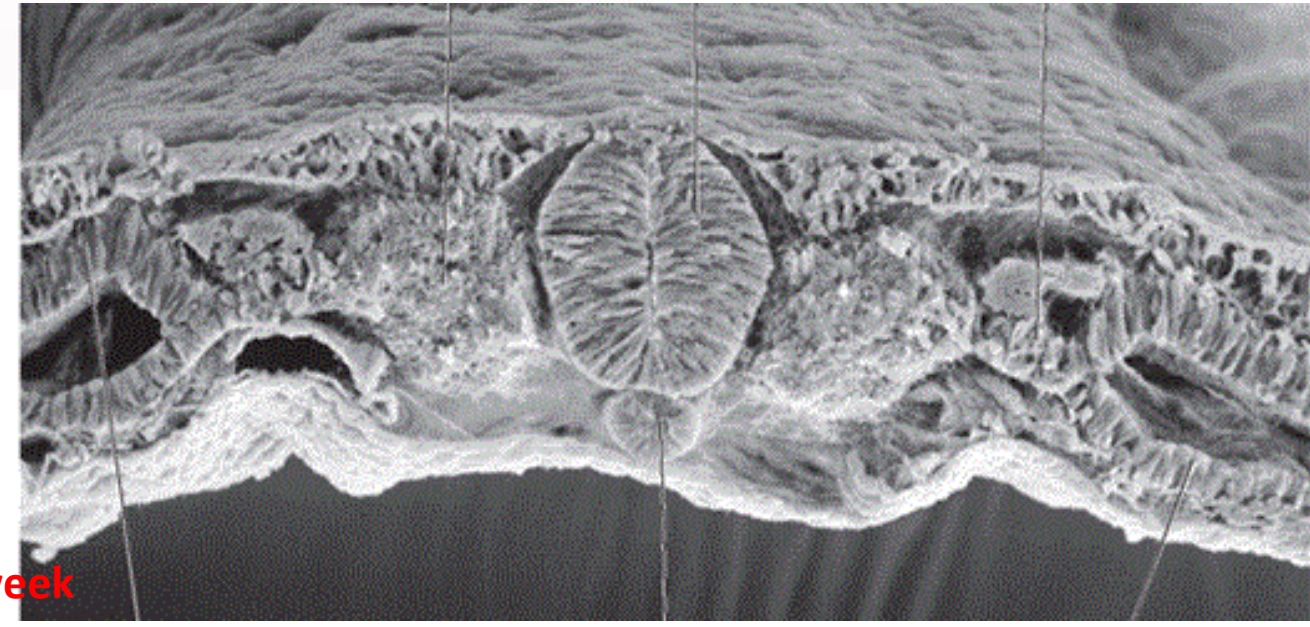
A new cell population appears – EMBRYONIC MESODERM

NOTOCHORD

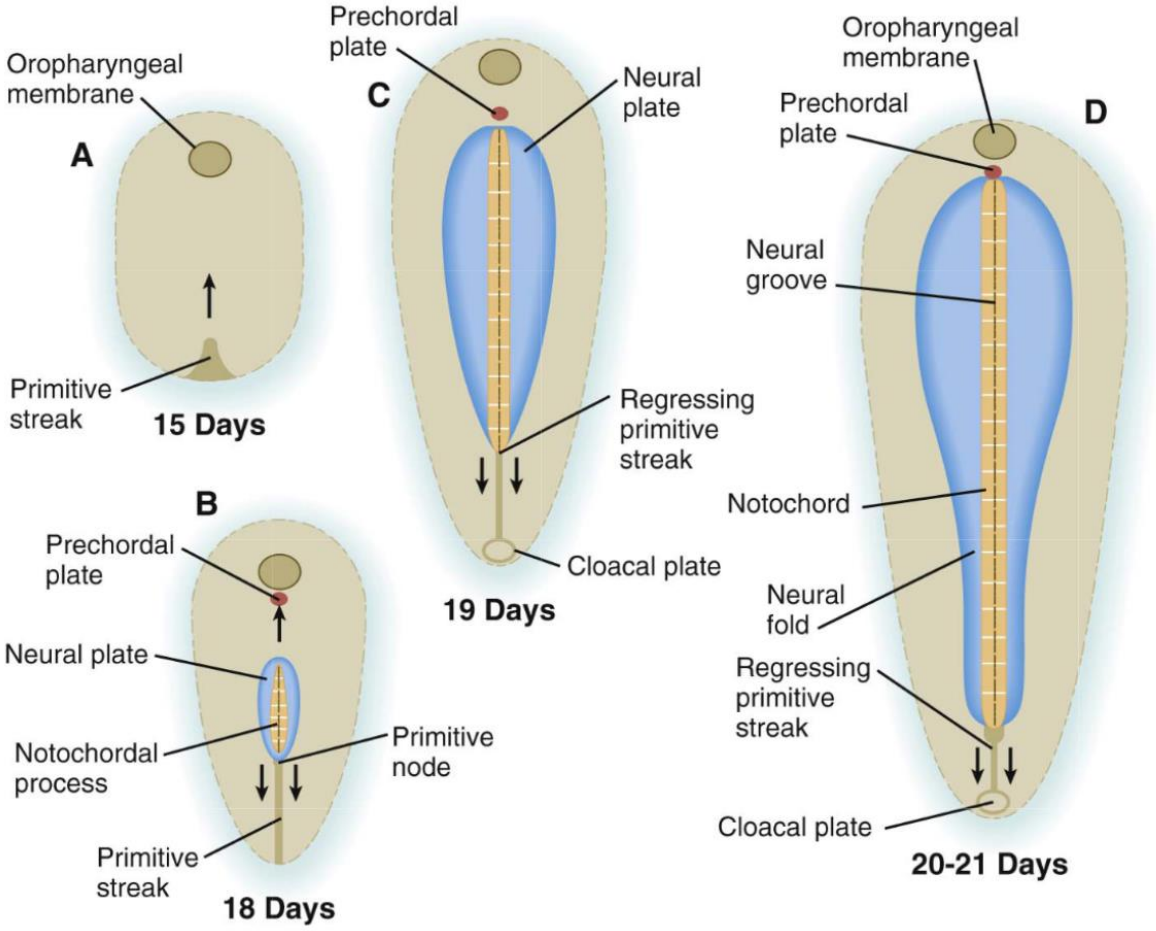


End of 2nd week



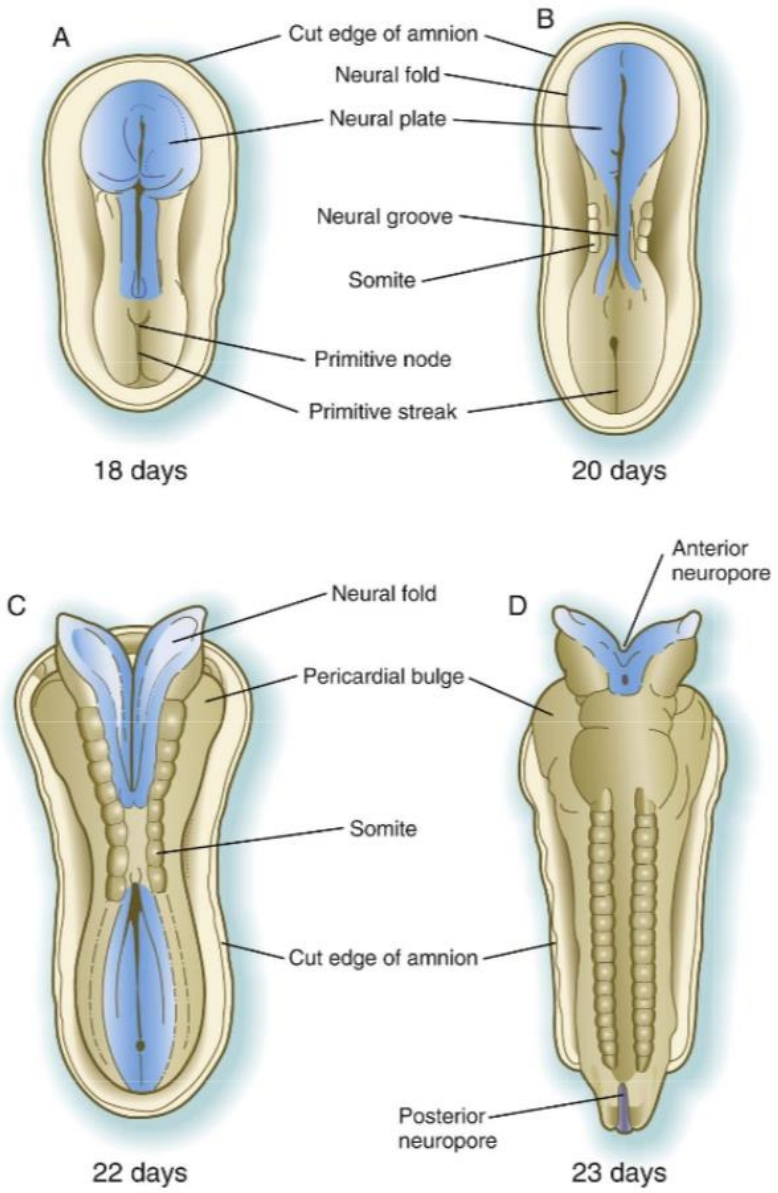
End of 3rd week

3rd week



Notochord induces differentiation of ectoderm – cellular basis of nerve system is established – **NEUROECTODERM**

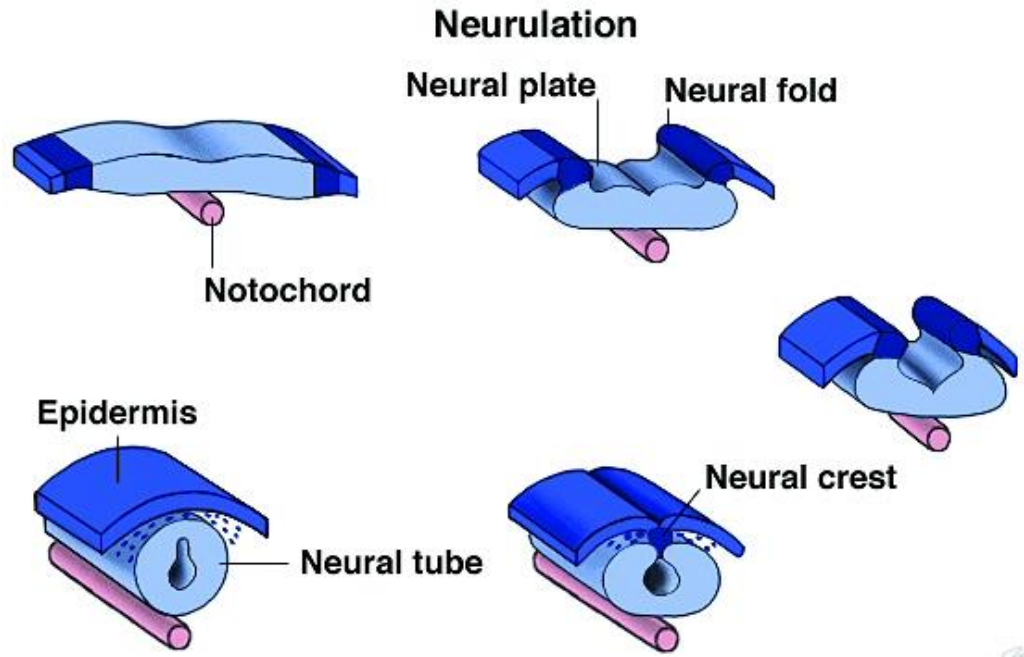
3rd week

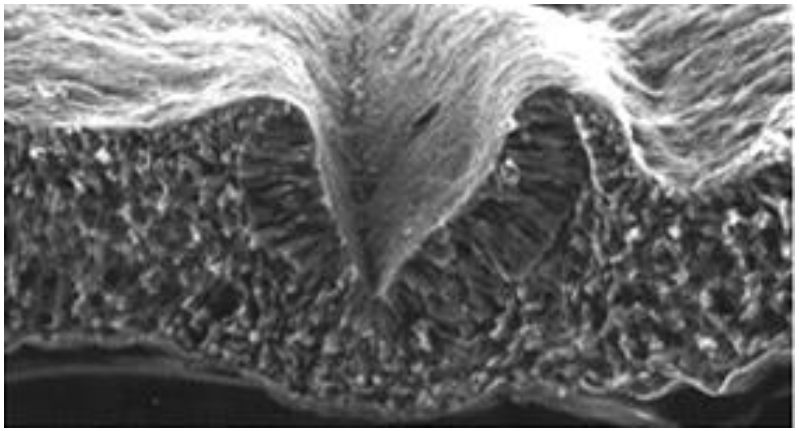


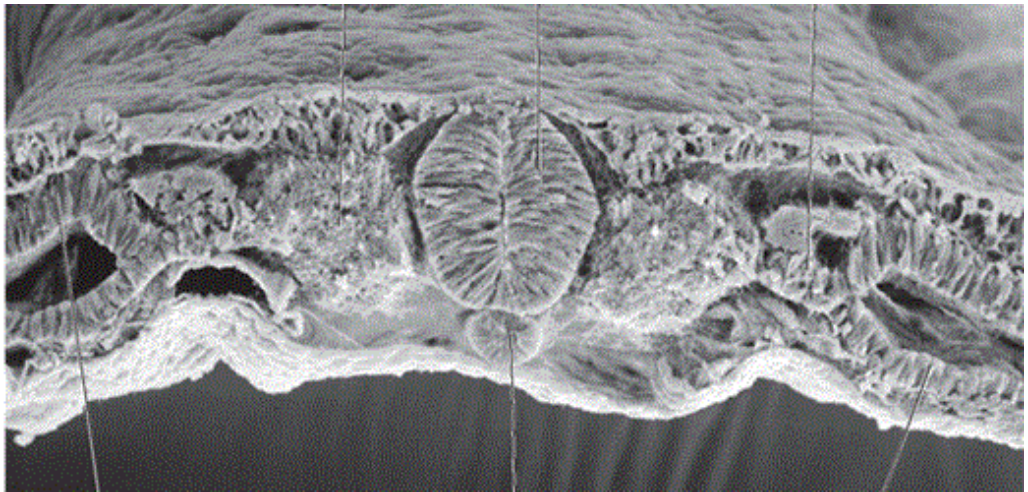
- **Neural plate**
- **Neural folds**
- **Neural tube**

- **Neural crest**

3rd week



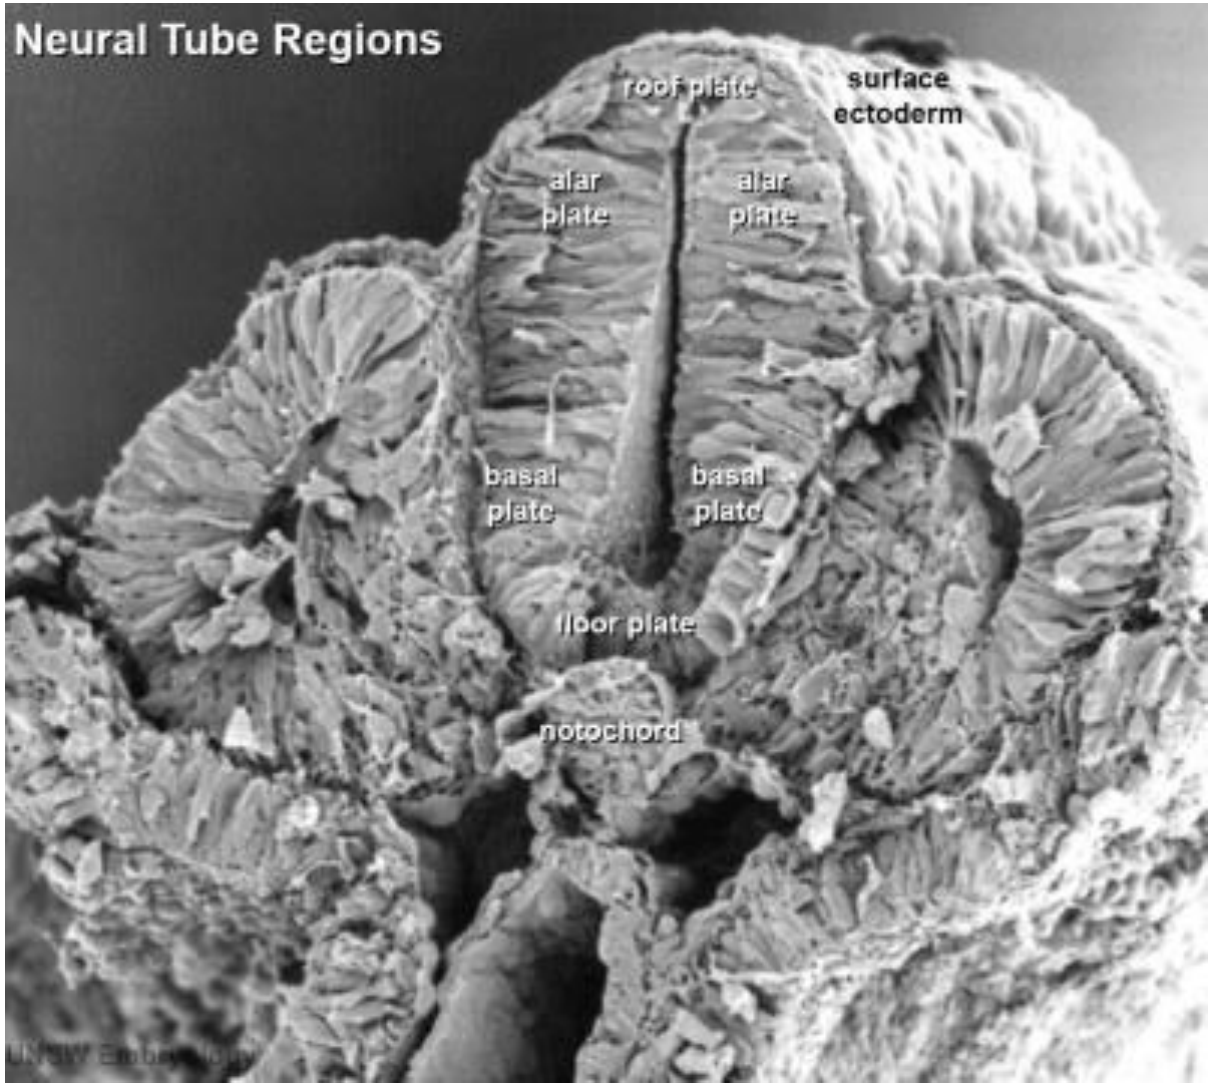




Endoderm and mesoderm produce BMP4 growth factors, that induce development of ***epidermis***

Notochord produces inhibitors of BMP4 - noggin, chordin and follistatin (cranially) a wnt3a and FGF (caudally) - ectoderm differentiates into ***neuroectoderm****.*

3rd – 4th week



Neural Tube Regions
roof plate
surface ectoderm
alar plate

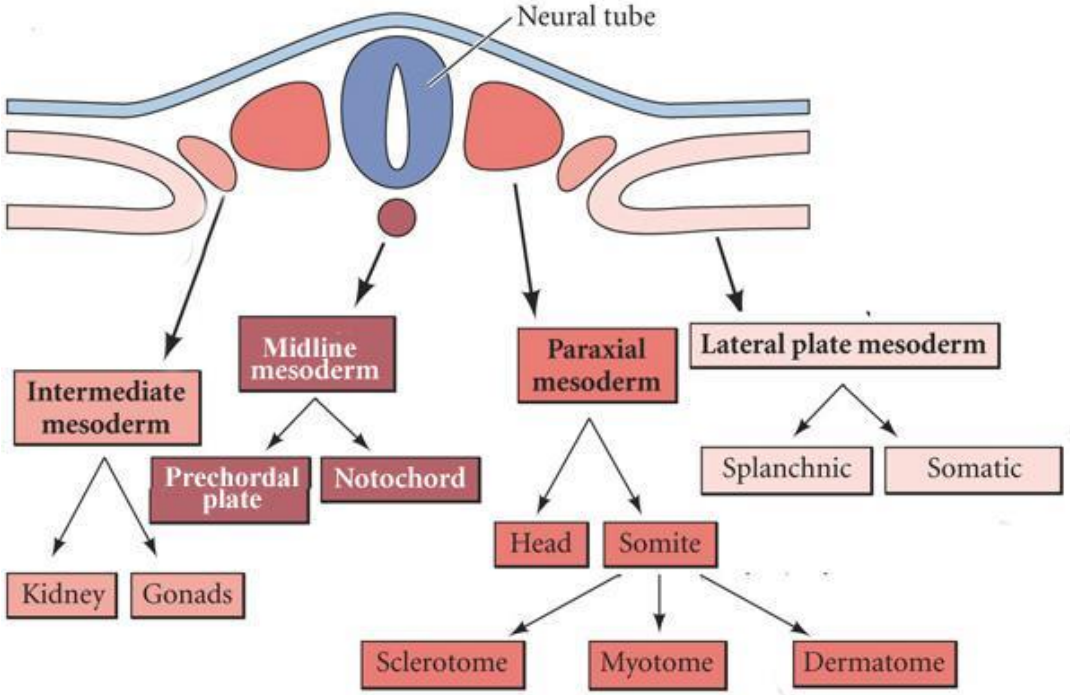
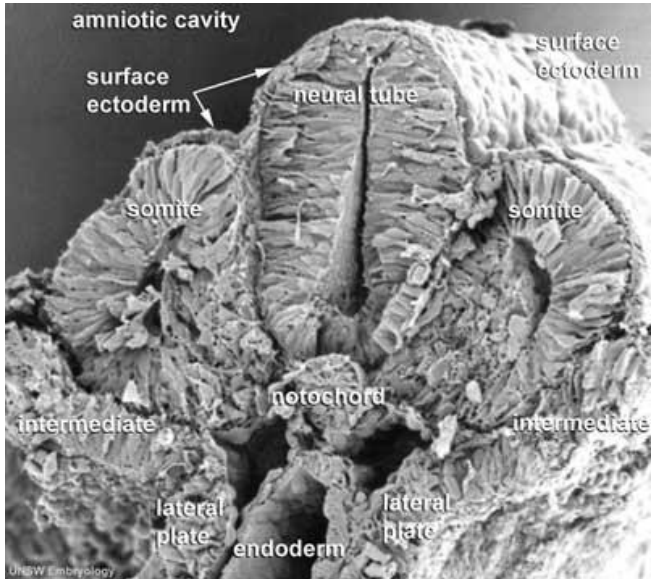
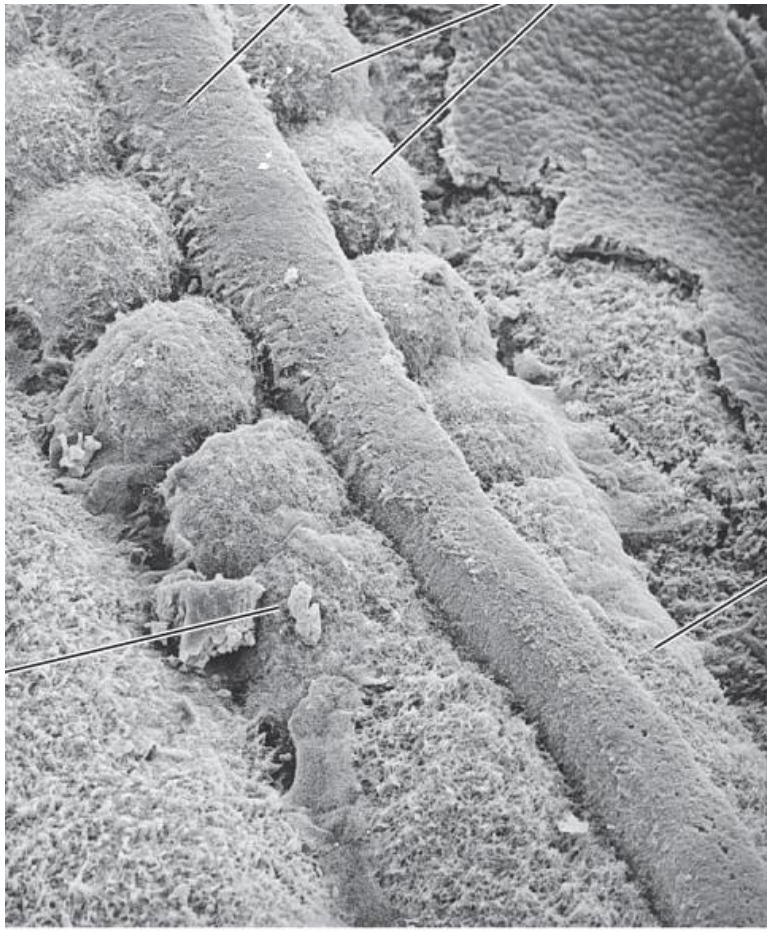
DERIVATIVES OF MESODERM

SOMITES

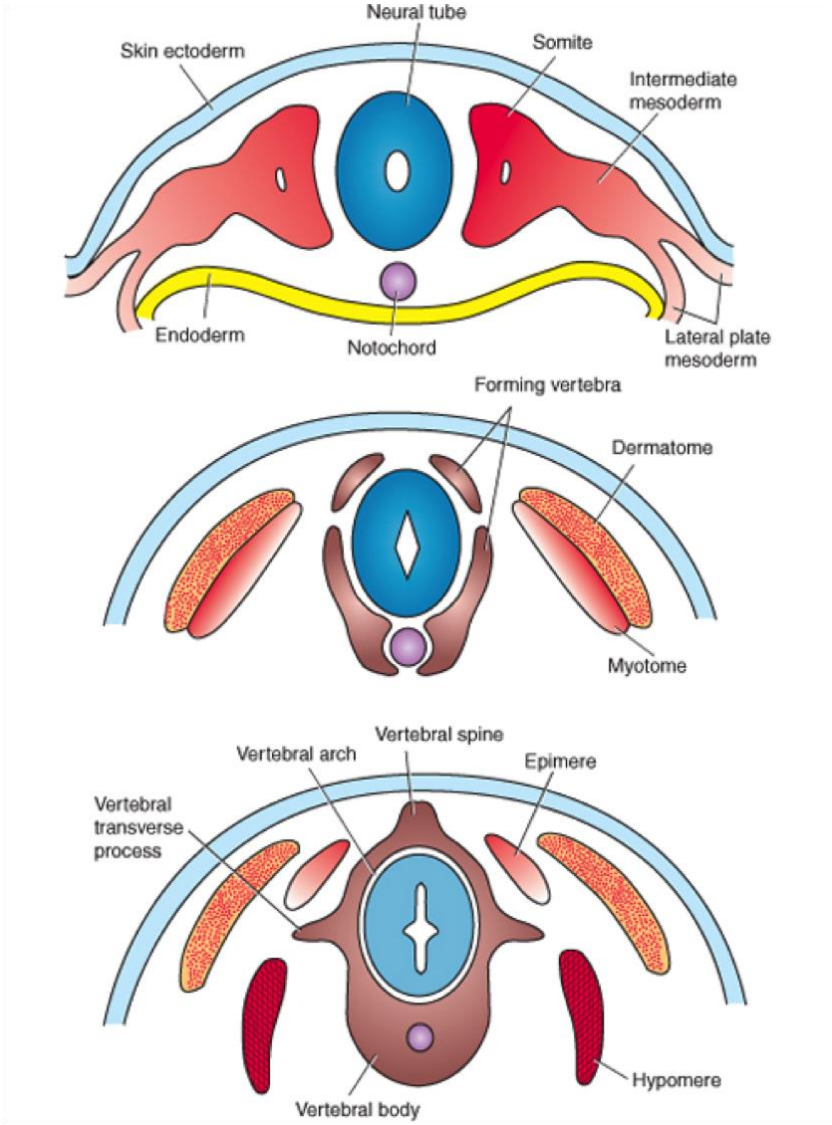


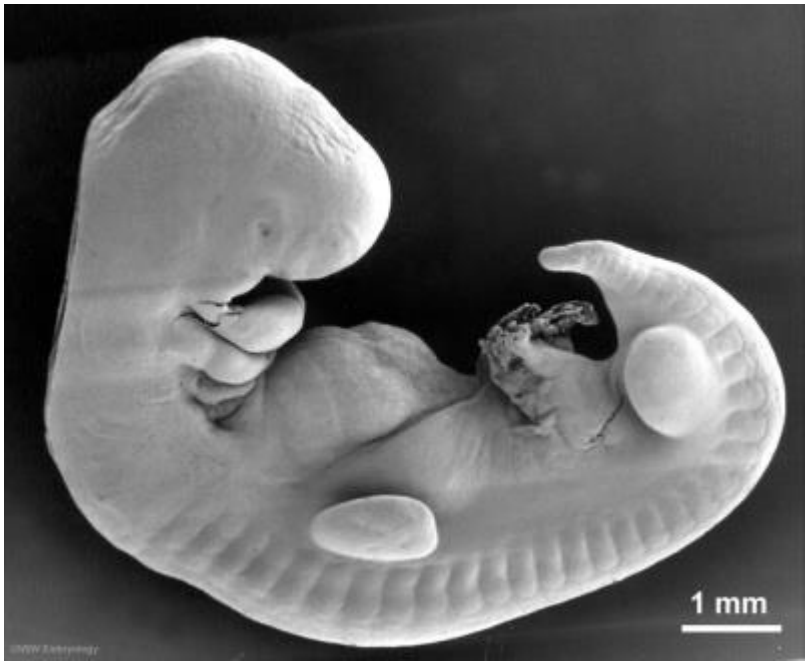




DERIVATIVES OF MESODERM

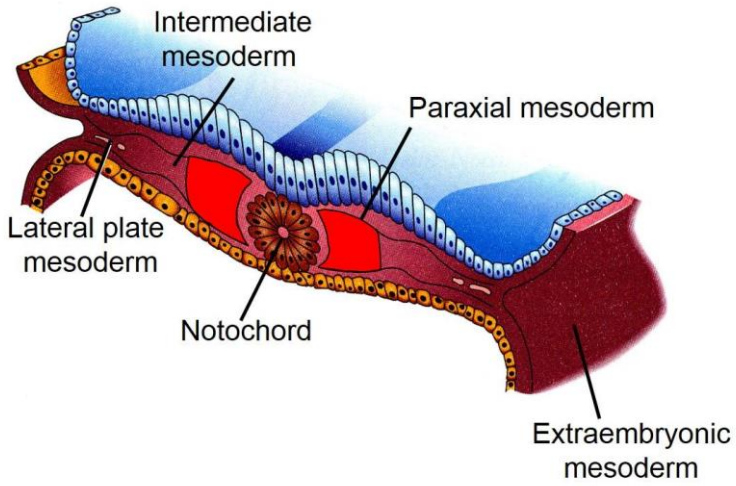
SOMITES

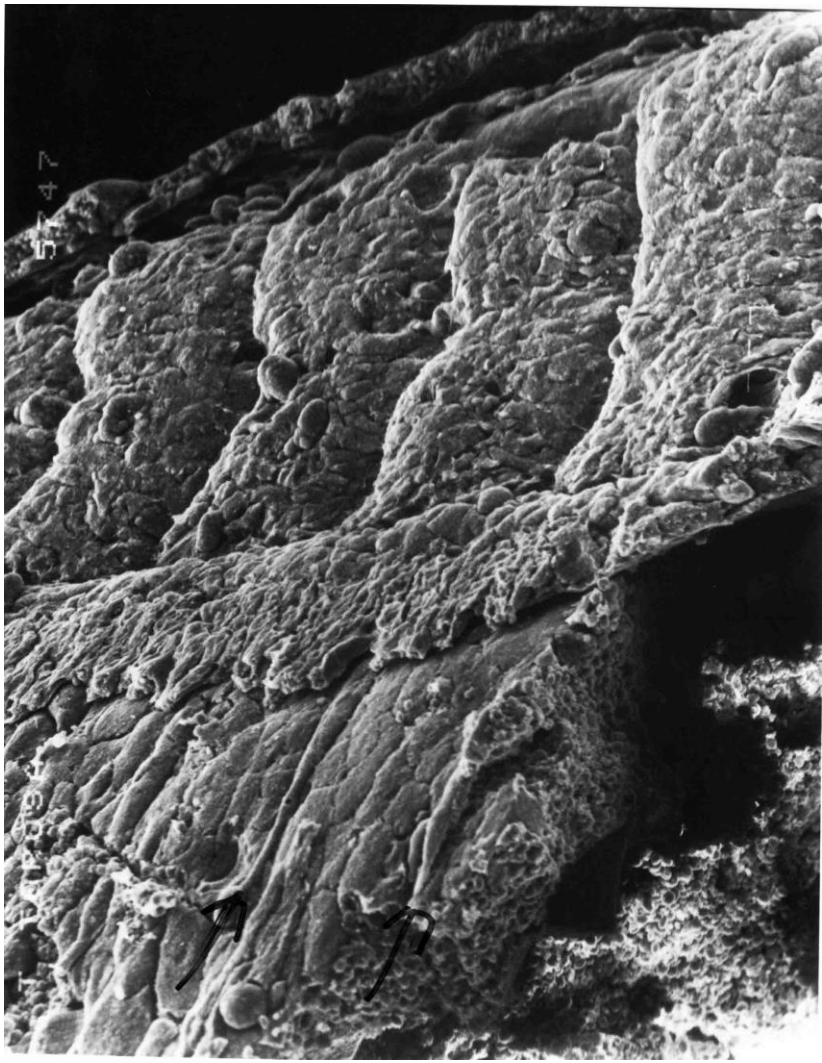




OTHER DERIVATIVES OF MESODERM

3rd – 4th week





- heart, cardiovascular system
- urogenital system
- muscle and skeletal system
- hematopoietic and lymphatic systems
- connective tissue, dermis
- mesothelium

DEVELOPMENTAL DISORDERS DURING GASTRULATION

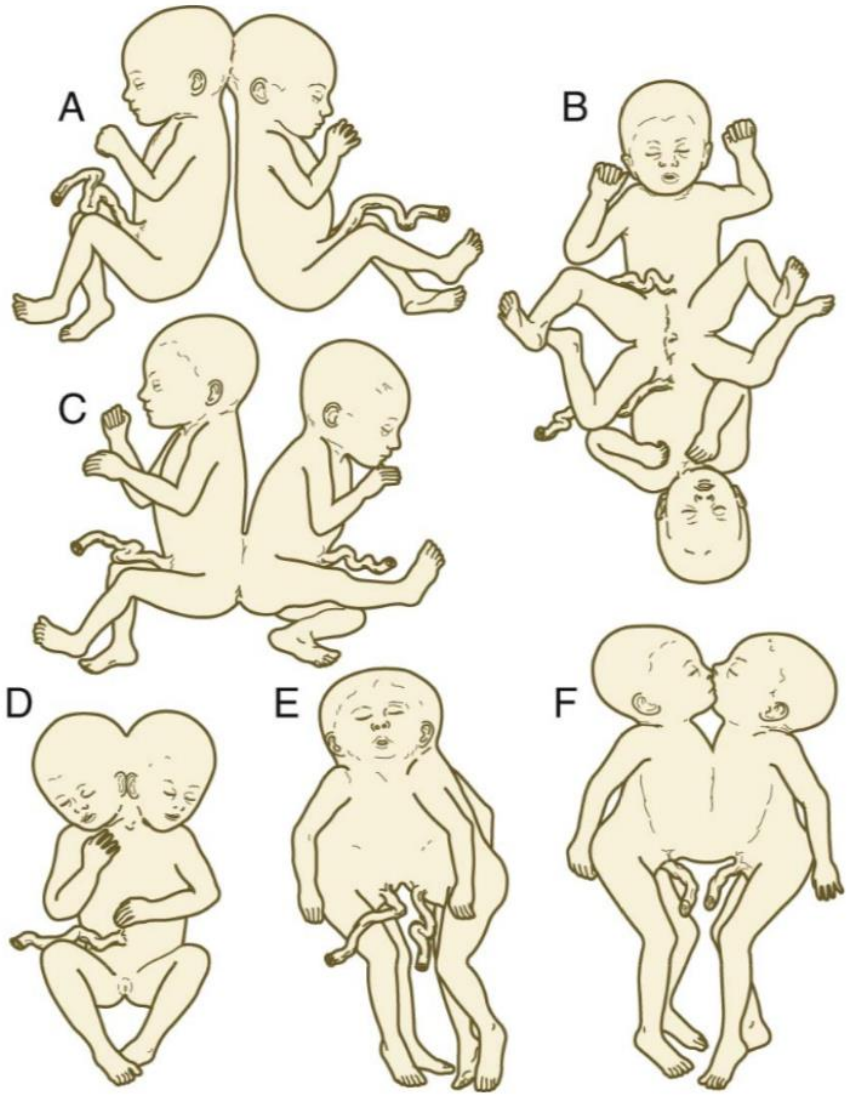
- Primitive streak is a temporary embryonic structure. Persistent primitive streak causes **sacrococcgyeal teratoma**.

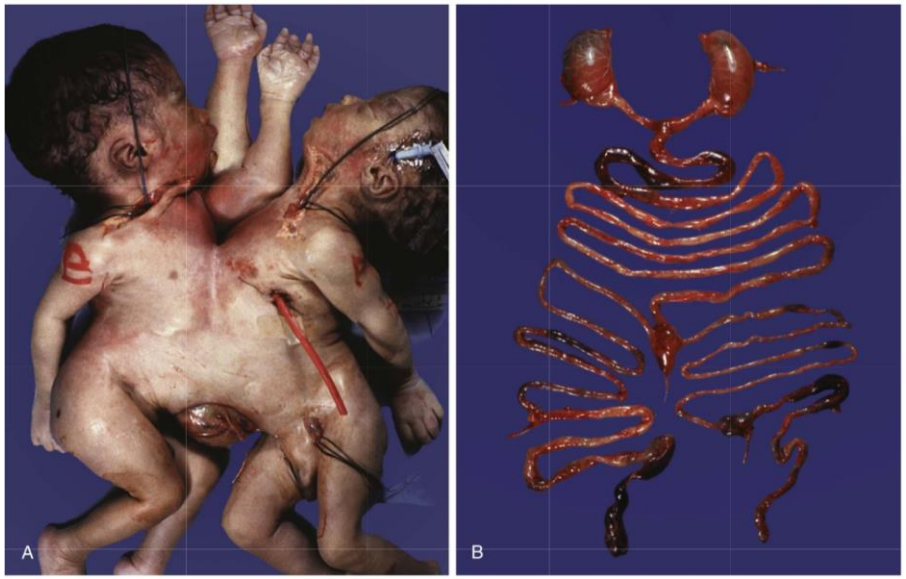
- Failure of primitive streak leads to absence of mesoderm in affected region - **sirenomelia**

- limbs
- urogenital system
- GIT

DEVELOPMENTAL DISORDERS DURING GASTRULATION

- If two primitive streaks form, conjoined twins may develop





WHAT DETERMINES EMBRYONIC AXES?

5 Yolk sac

EMBRYONIC DEVELOPMENT

week 4-6

- Mesoderm segmentation
- Primitive gut
- Esophagotracheal diverticulum
- Heart (starts beating day 22-23)
- Limb buds
- Primary brain vesicles, closing of neuropores
- Differentiation of neural crest
- Origin of thyroid and anterior pituitary
- Ectodermal placodes, optic vesicle
- Liver diverticulum
- Septum transversum

- Segmentation of mesoderm continues
- Posterior pituitary
- Heart septation begins
- Lung buds branch - pseudoglandular stage of lung development
- Cochlea grows
- Lens vesicle, nasal placodes
- Fourth brain ventricle forms
- Pharyngeal arches, ridges and pouches
- Limb buds grow
- Hematopoiesis in liver
- Retinal pigment

- Derivatives of endodermal pharyngeal pouches (parathyroid, thymus)
- Adrenal gland
- Heart and lungs descended to thorax
- Innervation of limbs, differentiation of myoblasts
- Face development – maxillary and mandibulary processes, palatine, choans
- Telencephalon stratifies – archicortex, paleocortex and neocortex. Choroid plexus
- Rotation of stomach
- Pancreatic diverticula fuse

EMBRYONIC DEVELOPMENT

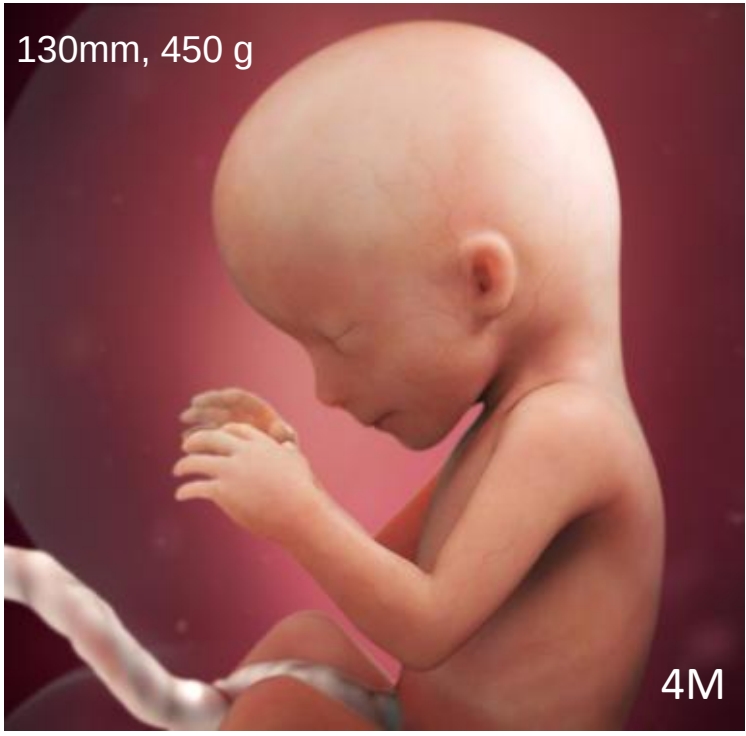
week 8

- Secretion from endocrine pancreas
- Growth of liver, growth and luminization of bile ducts
- Ossification of limbs begin
- Development of brain nuclei

- Joints of upper and later lower limbs allow rotation
- Fingers grow
- Stratification of cerebellar cortex
- Perforation of anal membrane
- Herniation of intestinal loops
- Testes produce testosterone
- Nose, meatus, eyelids, developer, external ears start to grow
- Backbone - 33-34 cartilaginous vertebrae
- Embryonic tail diminished

FETAL DEVELOPMENT

month 4-5



- Fetus swallows amniotic fluid – necessary for GIT development
- Rapid growth of head (non-proportional to rest of body)
- Eyelids fuse
- Ossification centers visible by ultrasound examination
- Development of external genitalia
- Kidneys produce urine, other organs start to work
- Skeletal muscles innervated
- Physiological umbilical hernia, in 12th weeks reposition of intestinal loops

- Rapid growth of fetus
- Ossification of skeleton
- Face growths, mandible visible
- Apparent external genitalia

FETAL DEVELOPMENT

month 5-9

- Limbs growth
- Mother feels fetal movements
- Vernix caseosa, lanugo
- Short hairs and eyelashes
- Fetus reacts to sound and later to light
- Lungs start to produce surfactant
- Limit of viability

- Eyelids open
- Wrinkled skin with visible capillaries
- Subcutaneous fat
- Hairs grow
- Maturing of organ systems

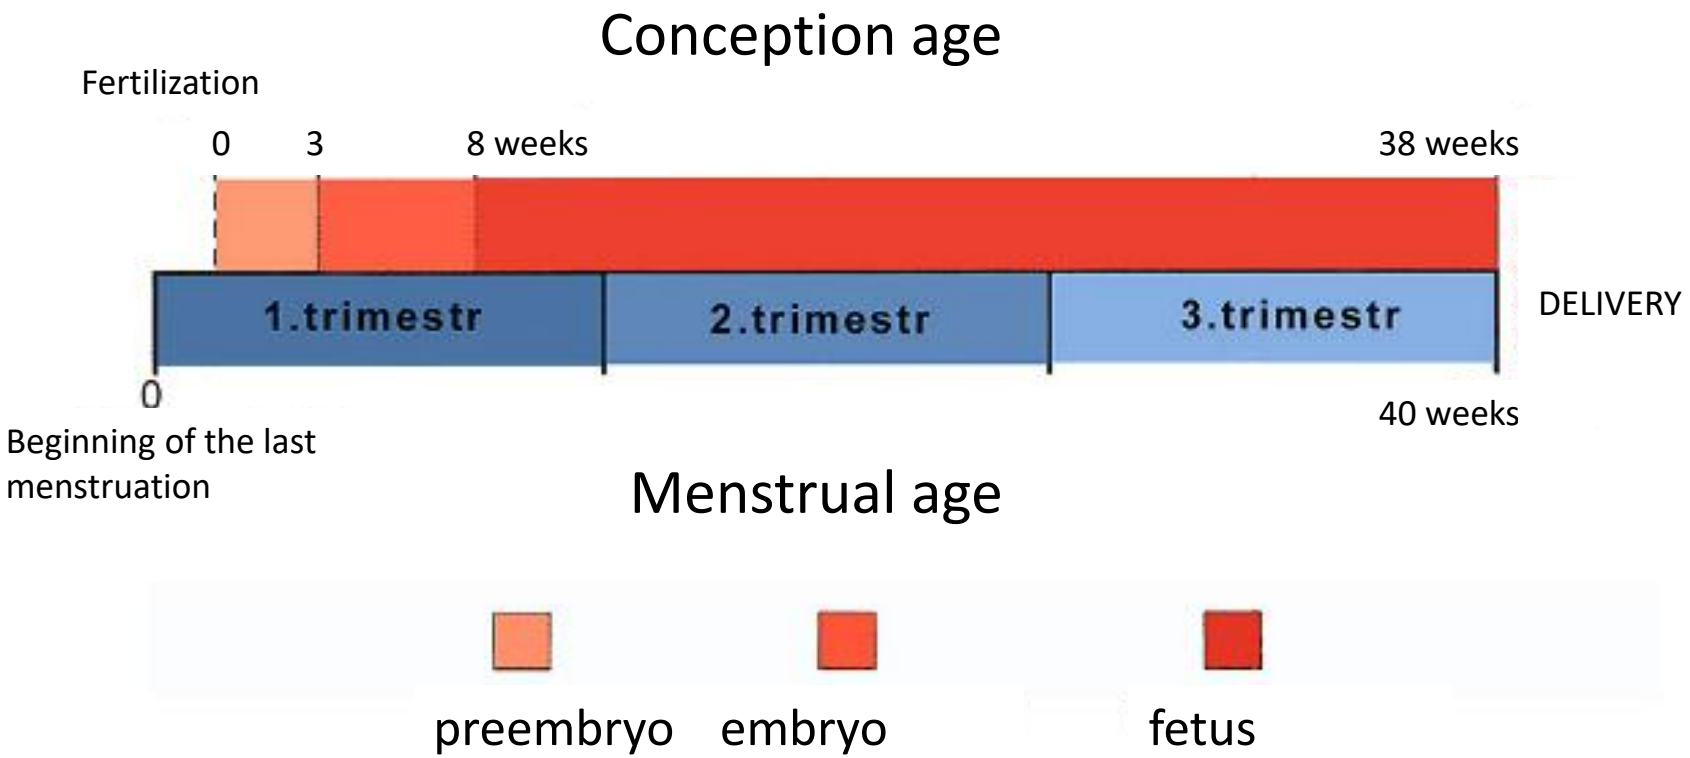
- Subcutaneous fat accumulates in limbs
- Smooth, red skin
- Hallmarks of full term fetus

LENGTH OF PREGNANCY

280 days (= 40 weeks = 10 lunar months) from the first day of the last **menstruation**

266 days (= 38 weeks) **from ovulation** (gestation age)

Calculation of term: First day of the last **menstruation + 1 year– 3 months + 7 days**



LENGTH OF PREGNANCY × FETAL MATURITY

Full term – related to length of pregnancy (menstrual age)

- preterm (<37 weeks)
- full term (38 – 40 weeks)
- after term (>42 weeks) (meconium in amniotic fluid)

Fetal maturity – development of fetus: **mature** X **immature**

HALLMARKS OF FETAL MATURITY

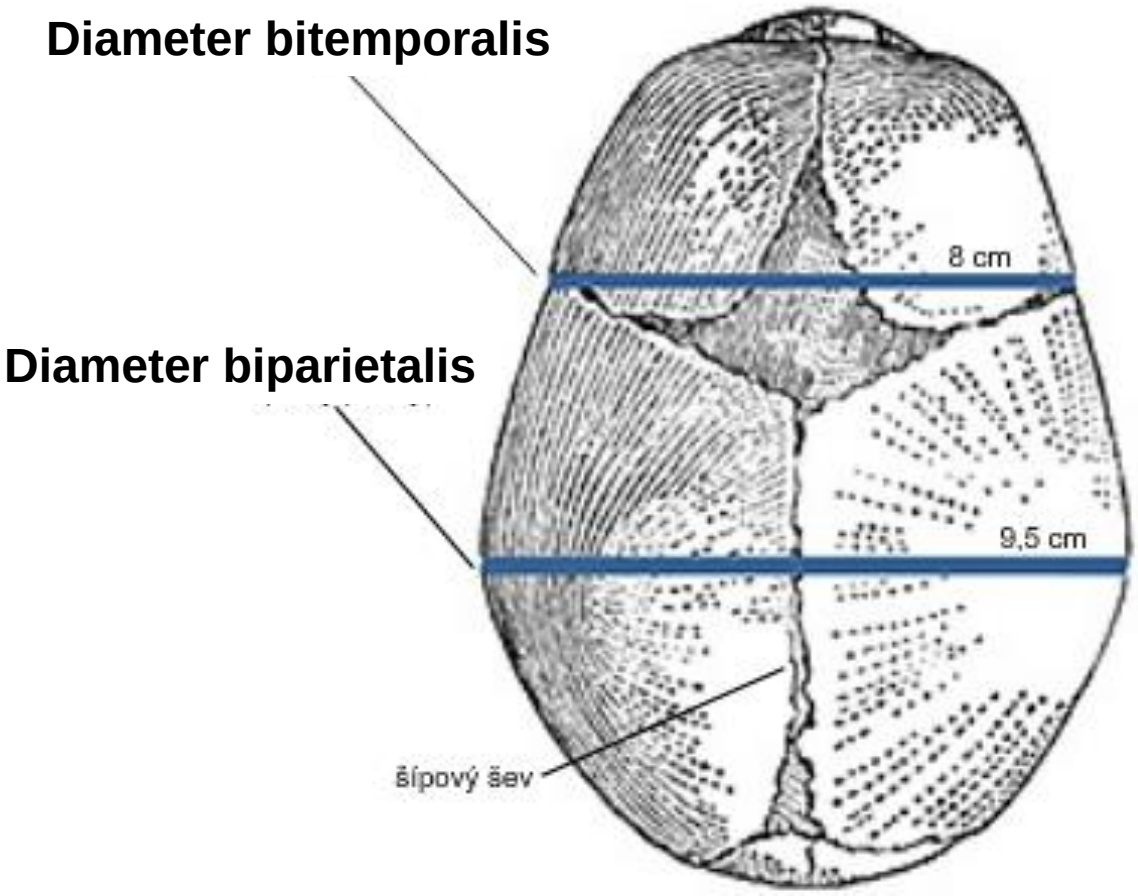
Major:

- **length (50 – 51 cm),**
- **weight** (around **3500 g**, physiological range 2500 - 4000g),
- head sizes
- boys - testes in scrotum, girls - labia majora over labia minora

Minor:

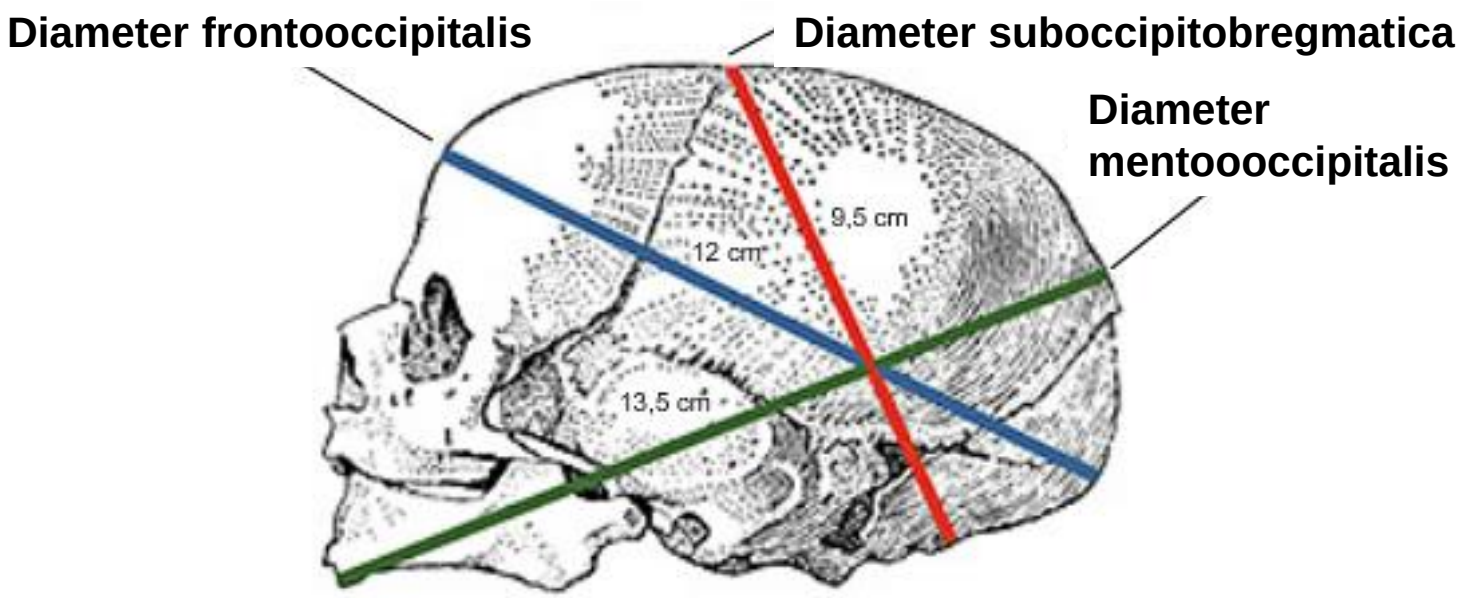
- eutrophic fetus, subcutaneous fat
- skin is not blue (no cyanosis), lanugo remains on shoulders and back,
- eyelashes, hairs several cm long, nails over fingertips
- cranial bones hard, anterior and posterior fontanelle are palpable, and separated
- newborn cries and moves (Apgar score)

Diameter bitemporalis – 8,00 cm
(join of the most distant points on sutura coronaria)
Diameter biparietalis – 9,5 cm
(join of midpoints of tubera parietalia)



Oblique sizes:

- **Diameter frontooccipitalis – 12.0 cm** (join of forehead midpoint and most distant point of occiput)
- **Circumferentia frontooccipitalis – 34.0 cm**
- **Diameter suboccipitobregmatica – 9.5 cm** (join of protuberantia occipitalis externa and midpoint of large fontanelle)
- **Circumferentia suboccipitobregmatica – 32.0 cm**
- **Diameter mentooccipitalis – 13.5 cm** (join of chin midpoint and most distant point of occiput)
- **circumferentia mentoocipitalis – 35 - 36 cm**
- **Diameter biacromialis – 12.0 cm, circumferentia biacromialis – 35 cm**
- (join of acromion – acromion)



RULE OF HAASE

- forensic medicne

3. – 5. lunar month: length in cm = square of month
6. – 10. lunar month: length in cm = months multiplied by 5

Lunar month	Length of fetus[cm]
3	9
4	16
5	25
6	30
7	35
8	40
9	45
10	50

FETUS IN UTERUS

1. **LIE (*SITUS*)** = relationship of the long axis of the fetus to that of the mother
- longitudinal: (99 %)
- transverse: (1 %) perpendicular axes
- oblique: unstable → longitudinal or transverse position

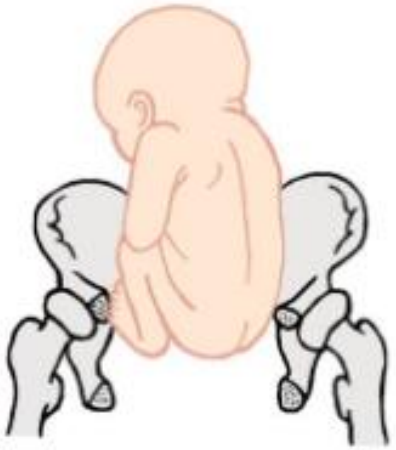
2. **POSITION (*POSITIO*)** = fetal backbone relative to uterus margin
- first= left (back to the left)
- second= right (back to the right)
- first/second common/less common

3. **FETAL HABITUS (*HABITUS*)** = relationship of one fetal part to another
- regular = head and limbs in flexion
- irregular = everything else

4. **PRESENTATION (*PRAESENTATIO*)** = that part of the fetus lying over the pelvic inlet; the presenting body part of the fetus.
- occiput (most common)
- vertex, forehead, face (1%)
- breech
- trunk, shoulder

FETUS IN UTERUS

longitudinal - occiput



longitudinal - breech

transverse

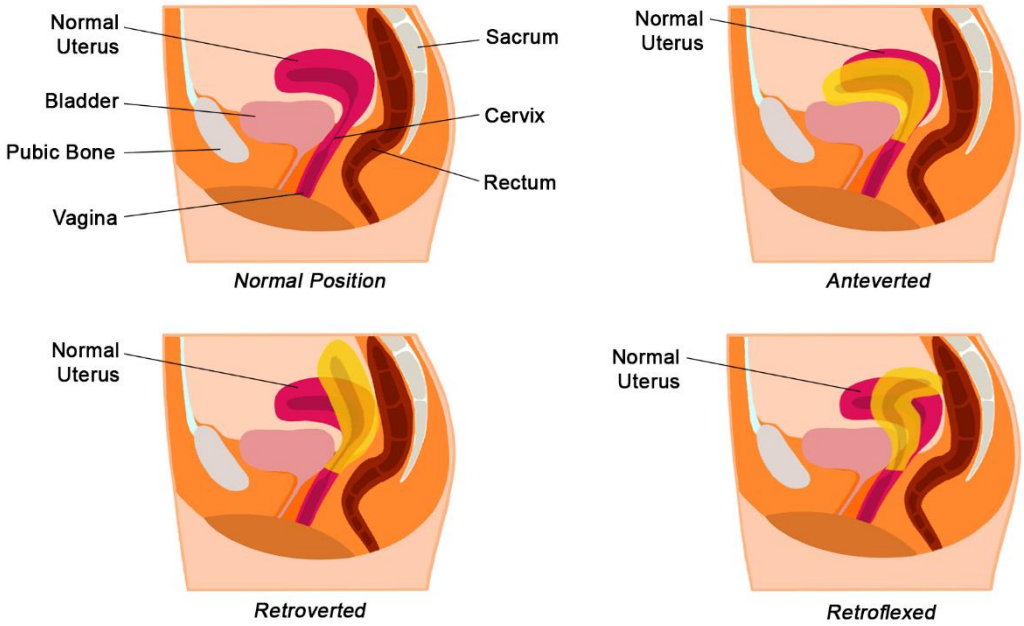
oblique

POSITION OF FETUS

- Relationship of fetus backbone to uterine margins (margo uteri sin., dx.)
- Position of uterus:

NORMAL POSITION:
anteversion (angle of vagina and uterus – facing forward – 70-100°)
anteflexion (angle of uterine isthmus and body – tilting forward – 160-170°)

Dextroversion, dextrotorsion Sinistroversion, sinistrotorsion	→	rotation and tilting of the uterus to the right or to the left in late pregnancy



POSITION OF FETUS

1. COMMON
(left occipitoanterior)

Uterus in dextrotorsion
Backbone left and forwards

1. LESS COMMON
(left occipitoposterior)

Uterus in sinistrotorsion
Backbone left and backwards

2. COMMON
(right occipitoposterior)

Uterus in dextrotorsion
Backbone right and backwards

2. LESS COMMON
(right occipitoanterior)

Uterus in sinistrotorsion
Backbone right and forwards

HABITUS AND PRESENTATION

HABITUS

irregular (any other)

regular

PRESENTATION

occiput

vertex

forehead

face

PHYSIOLOGICAL POSITION OF FETUS IN UTERO

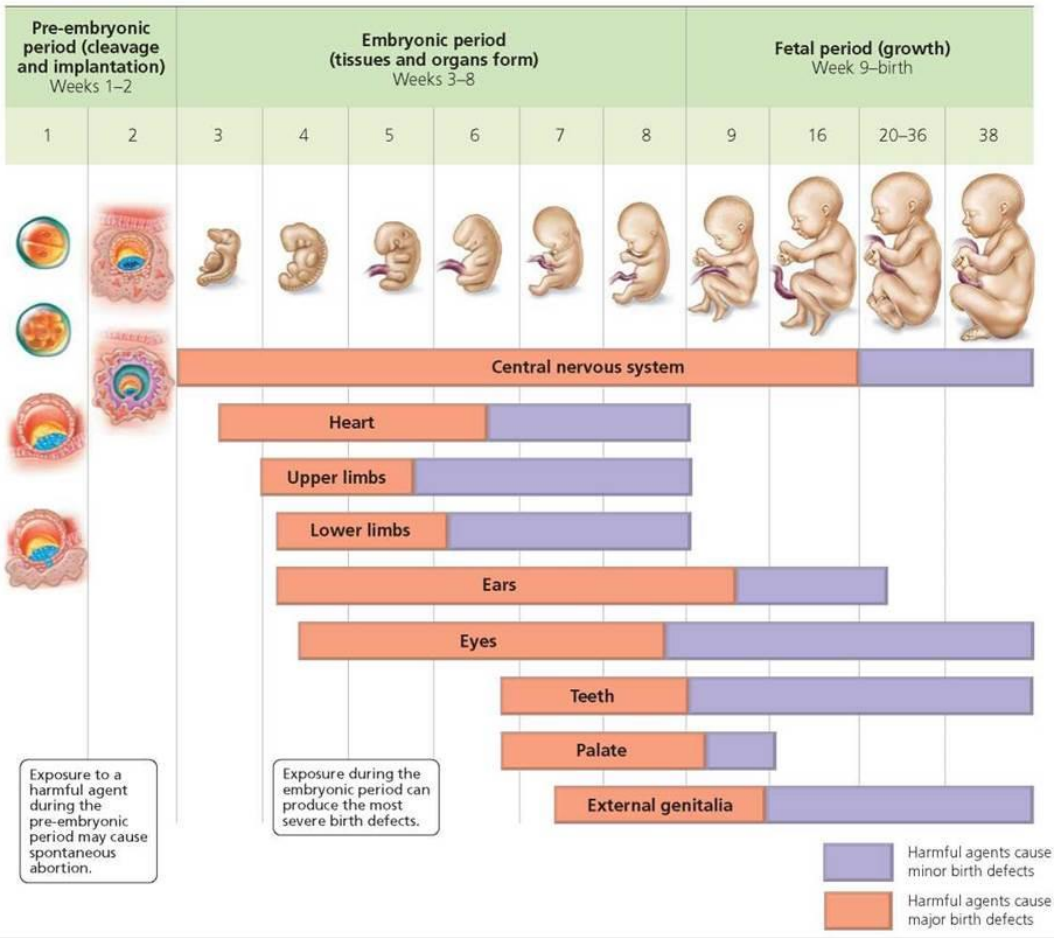
- **LIE LONGITUDINAL - HEAD FIRST**
- **POSITION FIRST COMMON**
- **HABITUS REGULAR**
- **PRESENTATION - OCCIPUT**

INTRODUCTION TO TERATOLOGY

- Congenital disorders – due to abnormal developmental events
- Genetic (inherited) or nongenetic (external) causes
- Teratogens

- Critical developmental periods

- Life style (alcohol, smoking, drugs)
- Infections (rubeola, HIV, toxoplasmosis)
- Lack or abundance of key substances (folic acid × retinoids)
- Chronic diseases (medical treatment)



INTRODUCTION TO PRENATAL DIAGNOSTICS

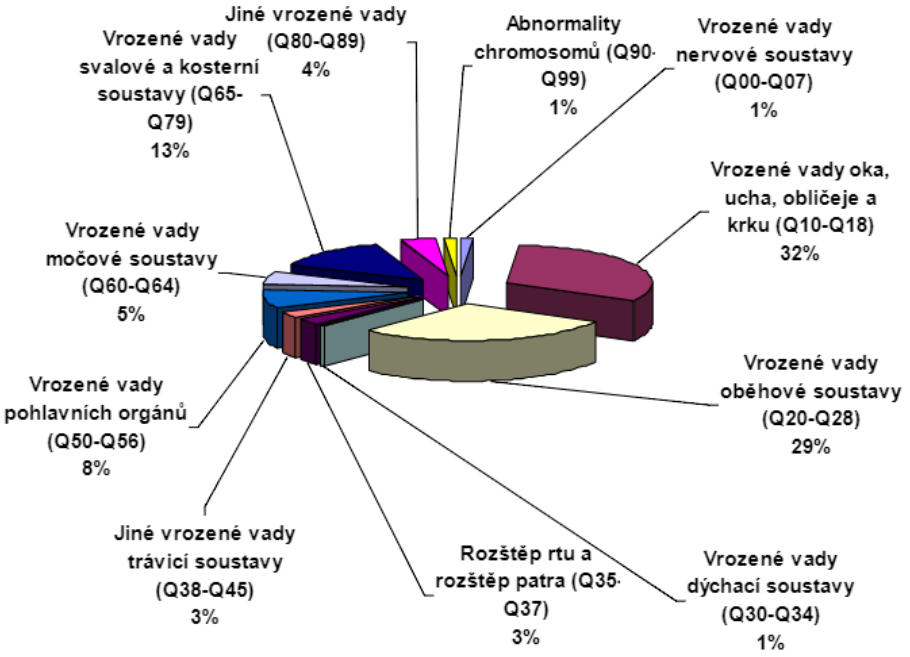
- Interdisciplinary care – biochemistry, genetics, gynecology and obstetrics, neonatology – parts of fetal medicine

- Revealing high risk pregnancies, access to preventive and therapeutic care

- Preventing delivery of fetuses with severe congenital malformations
- Support of delivery of genetically high-risk babies
- Planning and providing clinical care

- Genetic counselling
- Biochemical and ultrasound screening
- Karyotyping and DNA diagnostics
- Clinical diagnostics

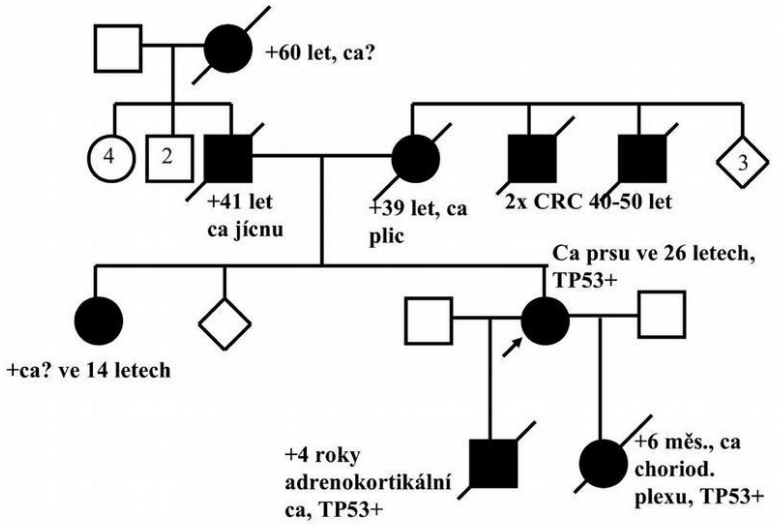
- Indication:
- congenital disorders in family
- positive screening in 1st or 2nd trimester
- abnormal finding by ultrasound
- maternal age (over 35 years)

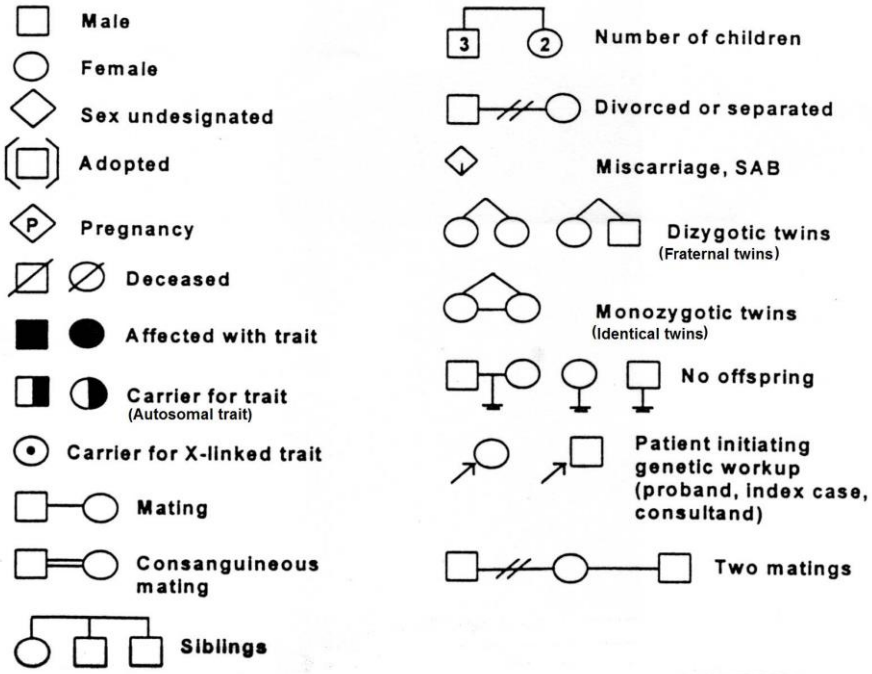


ČR 1994-2008

GENETIC COUNSELING

- Anamnesis (case history)
- Preconception counselling
- Explaining of examination results, causes, clinical symptoms, therapeutic options
- Minimization of risk of repeated disease
- Providing diagnosis and information for free choice
- Providing precise diagnosis and risk estimation
- Providing care during pregnancy and later





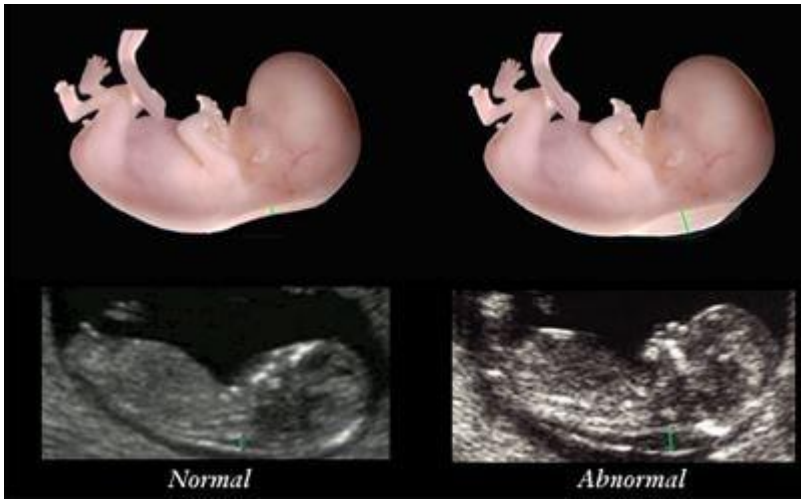
NONDIRECTIVE
ALL EXAMINATIONS AND
PROCEDURES ARE VOLUNTARY

BIOCHEMICAL SCREENING

- Non invasive
- Revealing high risk pregnancies – chromosomal aberrations and clefts
- **Screening is not a diagnostics** → further examinations (amniocentesis, karyotype, US)

- Tests between weeks 14-16 („TRIPLE test“)
- low sensitivity and specificity (50-60%), high false positivity (70%)
- AFP, E3, hCG
- chromosomal aberrations, abnormal closing of neural tube, defects of body walls

- Combined screening in week 11-13
- chromosomal aberrations – Down: 47,XY,+21, Edwards: 47,XY,+18, Patau 47,XY,+18
- US –nuchal translucence, NT
- PAPP-A, hCG (multiplies of median, MoM)
- age included in algorithm
- output: screening positive vs. negative (limit 1:100)



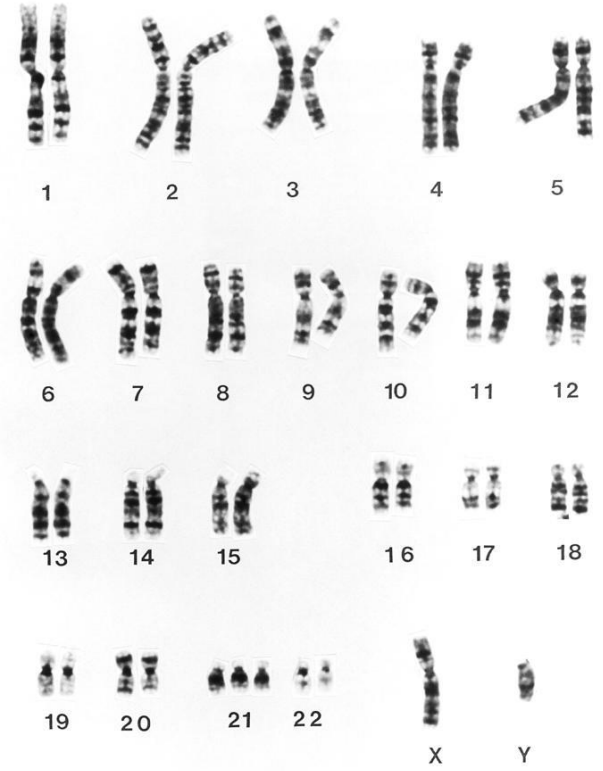
INVASIVE DIAGNOSTICS

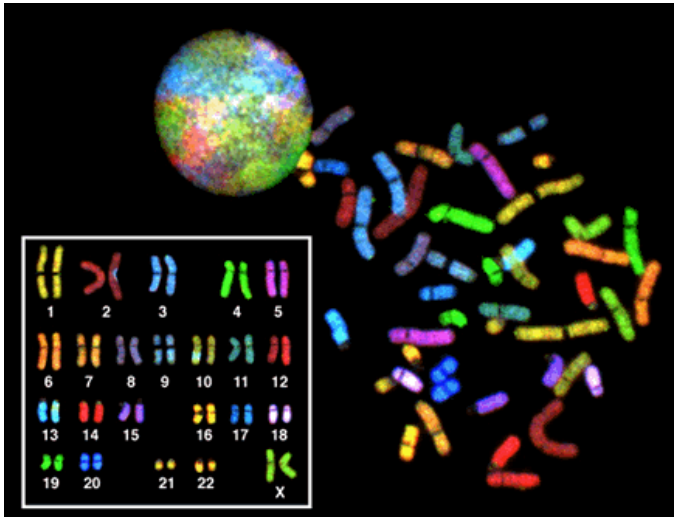
- Amniocentesis
- 16th-20th week
- US controlled amniotic fluid aspiration
- Cell culture, karyotype
- Risk of miscarriage 0.5-1%

- Chorion villus biopsy
- 10th-13th week
- Karyotype, molecular genetic examination
- Risk 0.5-1%

- Cordocentesis
- 22nd week
- Sampling of venous umbilical blood
- Now diagnostics and therapy of blood diseases (anemia, infections), or diagnostics in multiple pregnancies
- Risk 1%

- Fetoscopy
- Transabdominally (earlier transcervically)
- Visualization and fetal biopsy
- Risk 3-10%, done rarely





ULTRASOUND DIAGNOSTICS

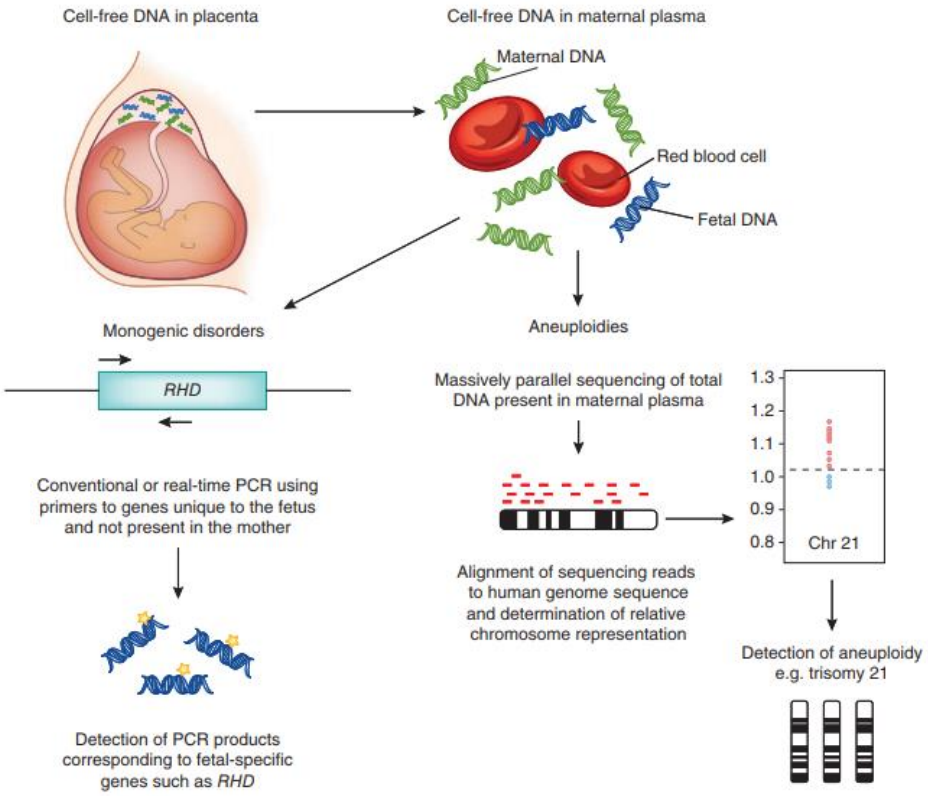
- 6-8th week
- confirmation of pregnancy, heart action
- number of fetuses

- 13-14th week
- nuchal translucence (risk > 3 mm)
- nasal bone (present × absent), **minor markers** (omphalocele, tricuspidal regurgitation, abnormality in ductus venosus flow, enlargement of urinary bladder-megavesica)
- fetal size

- 20-22nd week
- detailed screening
- fetal biometry (biparietal diameter, head circumference, length of femur)
- head and CNS (shape, cavity in septum pellucidum, ventricles, cerebellum, cisterna magna), face (lip, jaws, nose, orbits, profile), heart (action, size, axis, 4-chamber projection, outflow tracts, ...), thorax (pathological structures), abdominal cavity (stomach, intestine, kidneys, urinary bladder, umbilicus and umbilical vessels), backbone, limbs, palms, feet
- placenta, volume of amniotic fluid

- 30th week
- fetal size
- volume of amniotic fluid
- placenta (exclusion of *placenta praevia*)

ADVANCEMENTS IN MOLECULAR GENETICS



Analysis of cell-free fetal DNA in maternal blood
Since 12th week
Massive paralell sequencing (Next-Gen Sequencing)
Common aneuploidies (trisomy 21,13,18)
Monogeneous disorders

SOP-M8	NEINVAZIVNÍ DETEKCE ANEUPLOIDIÍ CHROMOZOMŮ 13, 18 A 21 POMOCÍ MULTIPLEX PCR A MASIVNÍHO PARALELNÍHO SEKVENOVÁNÍ (MPS)

Test Clarigo se značkou „CE", která je nezbytná pro provedení tohoto vyšetření v zemích EU, splňuje základní požadavky Směrnice Rady IVD 98/79/EC pro *in vitro* diagnostiku.

VÝSLEDEK VYŠETŘENÍ:

Chromozom	Stav	Fetální frakce	Předpokládané pohlaví plodu
13	normální	7,1 %	ženské
18	normální		
21	normální		

ZÁVĚR:

Analýzou volné fetální DNA cirkulující v krvi těhotné nebylo zjištěno zvýšené riziko aneuploidie chromozomů 13, 18 a 21.

Komentář: doporučujeme genetickou konzultaci.
Pozn: Při patologickém nálezu je výsledek nutné ověřit některým z invazivních postupů (např. odběr plodové vody, choriových klků, kordocentéza s následnou QF-PCR analýzou nebo stanovením klasického karyotypu apod.).

SUMMARY

- Early embryogenesis
  - From fertilization to a blastocyst
  - Bilaminar and trilaminar germ disc
  - Axial structures of the embryo
  - Notochord and neurulation
  - Definition of germ layers and mesoderm specification
  - Folding of the embryo and beginning of organogenesis

- Development and maturation of fetus
  - Time periods in fetal development
  - Length of pregnancy and hallmarks of full-term/mature fetus
  - Position of fetus in utero
  - Introduction to prenatal screening and diagnostics
  - Introduction to teratology
