

Welcome to Clinical anatomy of the head, neck and neuronal pathways
Lecture #13

Alemeh Zamani, Ph.D.
Department of Anatomy
MUNI, MED

Today's lecture will cover:

- Week #8** NS Barriers, Plasticity and Regeneration of Nervous System, Visual, Auditory, Vestibular, Olfactory, and Gustatory Pathways
- Week #10** Somatosensory and viscerosensory; pain pathways and connections of stress analgesia
- Week #11** Pathways of the somatomotor system, connections of the cerebellum and basal ganglia; spinal reflex motoric; eye movements
- Week #13** Arrangement and function of the autonomic nervous system

Arrangement and function of the autonomic nervous system

- Functions:
- Contraction and relaxation of smooth muscles
 - Function of all exocrine glands
 - Heart rate
 - Some metabolic processes

Autonomic Nervous System

- Sympathetic:**
Thoracolumbar outflow
T1-L2
- Parasympathetic:**
Craniosacral outflow
CN III, VII, IX, X & S2-S4

Autonomic Nervous System

Figure 14.8 Neurotransmitters of autonomic neurons

Sympathetic Nervous System

Catabolic reaction (activities that are mobilized during emergency and stress situations)

- Generalized reaction of body
- Increase heart rate
 - Bronchodilation
 - Mydriasis
 - Sweat secretion
 - Glycemia

"Fight or Flight"

Anatomical Organization of the Sympathetic Preganglionic and Postganglionic Axons

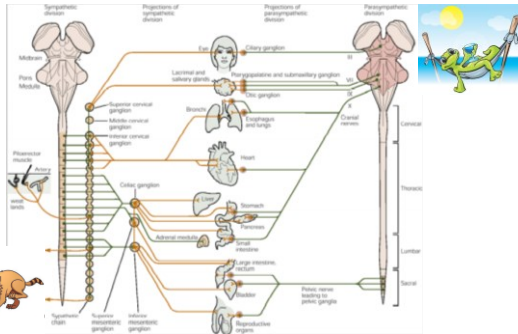

Parasympathetic Nervous System

Anabolic reactions (activities associated with conservation and restoration of body resources)

"Rest and Digest"

Localized reaction of body

- o Decrease heart rate
- o Bronchoconstriction
- o GIT activation
- o Miosis

Central parts of Autonomic Nervous System

Pathways distributing visceral sensory information in the brain

Pathways that control autonomic responses

Central parts of Autonomic Nervous System

Hypothalamus (subsystem of limbic brain = visceral brain)

Ncll. hypothalamici ant. control parasympatic (fasciculus longitudinalis dorsalis)

Ncll. hypothalamici medii Control the sympathetic (over RF, tr. tegmentalis centralis)

Innervation of the Eye

The sphincter pupillae is supplied by parasympathetic nerves.

The dilator pupillae is supplied by sympathetic nerves.

Pupillary Light Reflex

A reflex that controls the diameter of the pupil, in response to the intensity of light (luminance) that falls on the retina of the eye

- o **mydriasis:** dilation of the pupil
- o **miosis:** constriction of the pupil
- o direct response
- o consensual response
- o anisocoria

Accommodation Reflex

- o Changing the radius of curvature of the lens to focus the world on the retina.
- o Accommodation reflex involves convergence (voluntary), pupillary constriction and accommodation (involuntary).

Edinger-Westphal nuclei → oculomotor nerve → ciliary ganglion → short ciliary nerves → sphincter pupillae and ciliaris

Reading list

Thank you very much for your attention
