

Oral and maxillofacial surgery II.

Anaesthesia
Suture

Anaesthesia

Topical

By injection

- Infiltration
- Nerve block

Infiltration

- Syringe
- Short needle

Raise lip or cheek

The puncture is situated into mucosa appr.

1cm from fornix vestibuli. Do not touch periosteum.

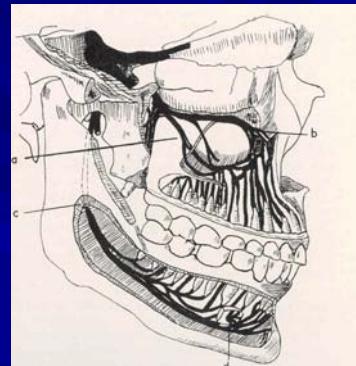

Infiltration anaesthesia

■ Suitable for

- simple extractions in maxilla, mandibular incisors, canines
- soft tissue surgery

Nerve block anaesthesia

- Foramen mandibulare
- Foramen mentale
- Foramen palatinum majus
- Foramen incisivum
- Foramen infraorbitale
- Tuber maxillae

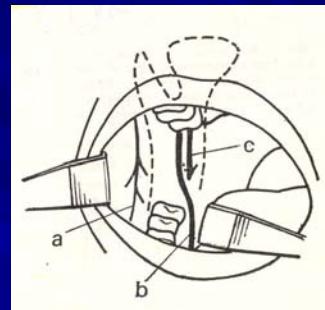

Nerve block anaesthesia

N. alveolaris inferior

Foramen mandibulare

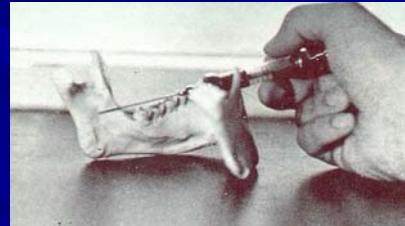

N. Alveolaris inferior
N. lingualis

Nerve block anaesthesia

Nervus alveolaris inferior

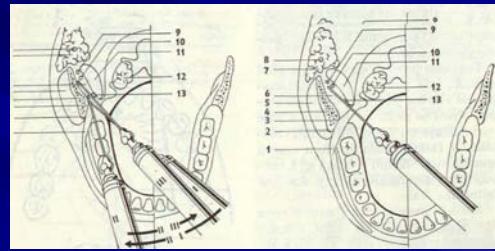

In sulcus colli mandibulae

Nerve block anaesthesia

N. alveolaris inferior

Indirect

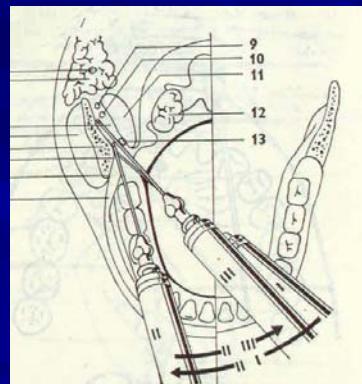

Direct

Nerve block anaesthesia

N. alveolaris inferior

Indirect

Put the forefinger
on the occlusal surface
Rotate inside (nail inside)
1 cm up occlusal surface
the puncture is situated

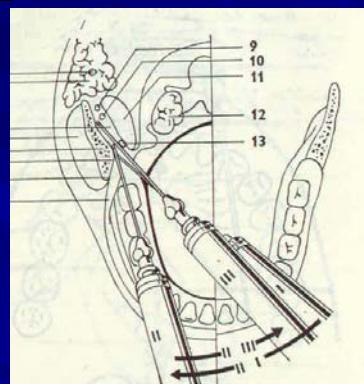

Nerve block anaesthesia

N. alveolaris inferior

Indirect

1. The needle goes behind
the crista temporalis,
the syringe
on the opposite canine

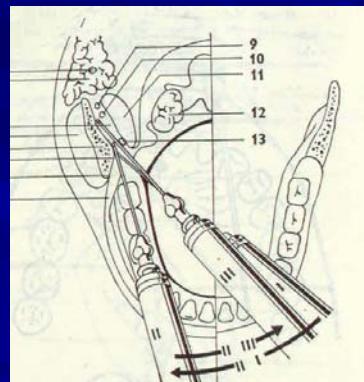

Nerve block anaesthesia

N. alveolaris inferior

Indirect

2. The needle goes deeper
in the contact with the bone
The syringe goes mesial

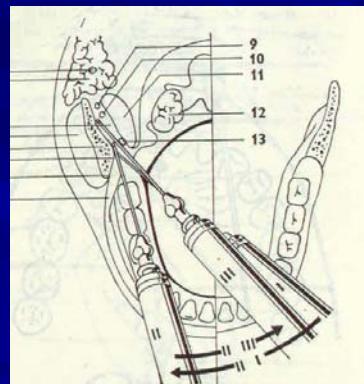

Nerve block anaesthesia

N. alveolaris inferior

Indirect

3. The contact with bone
Is lost, the syringe goes back

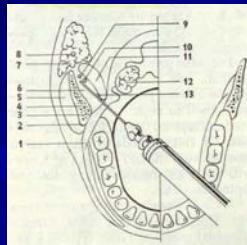

Nerve block anaesthesia

N. alveolaris inferior

Direct

Put the forefinger
on the occlusal surface
Rotate inside (nail inside)

1,5 cm deep

Nerve block anaesthesia

N. alveolaris inferior

Area blocked

Molars
Premolars
Tongue

Nerve block anaesthesia

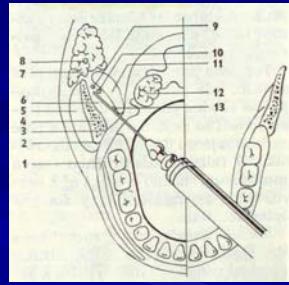

N. alveolaris inferior

Direct

- The puncture at the same place
- The syringe on opposite premolars
- The puncture goes into the small pink depression medial from crista temporalis and lateral from plica prerygomandibularis

1,5 cm deep

Molars, premolars, mucosa, skin, bone

Nerve block anaesthesia

N. mentalis

F. mentale

The puncture is situated behind
the distal surface of 2nd premolar
The needle goes between
roots of premolars

Nerve block anaesthesia

N. mentalis

F. mentale

The puncture is situated behind
the distal surface of 2nd premolar
The needle goes between
roots of premolars,
From up to down
Forward and mesial

Premolars and canine, mucosa, skin.

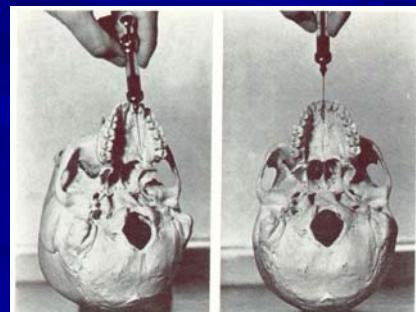

Nerve block anaesthesia

Foramen palatinum majus

Distal surface of 1.st molar

The puncture is
0,5 – 1 cm before

Half of palate

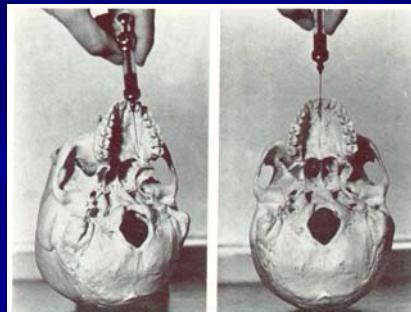

Nerve block anaesthesia

Foramen incisivum

Nervus incisivus
Papilla incisiva
Next to papilla,
mesial direction

*Triangular area
behind incisors*

Anaesthesia on f. infraorbitale

- Find the margo infraorbitalis
- Raise the lip
- The puncture is situated between canine and 1st premolar
- The needle goes to the region (appr 1 cm below margo infraorbitalis)

Anaesthesia on tuber maxillae

- The drug is delivered on tuber maxillae
- The puncture is situated behind 2nd molar (distal surface), goes behind and upper around tuber maxillae.

Suture

Suture material

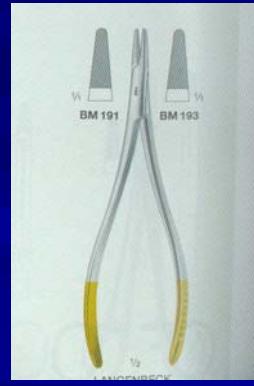

Silk,nylon

Needels

- bent, rounded
- straight

Needle holders

- autofix
- without fixation

Suture

Suture material

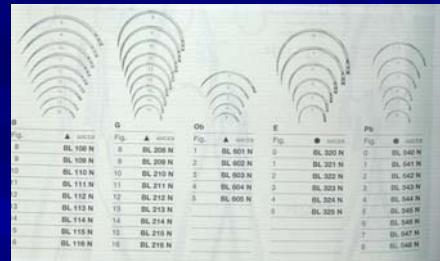

Silk,nylon

Needels

- bent, rounded
- straight

Needle holders

- autofix
- without fixation

Suture

Suture material

Silk,nylon

Needels

- bent, rounded
- straight

Needle holders

- autofix
- without fixation

Tweerers – tissue forceps
