

CARDIAC MECHANICS

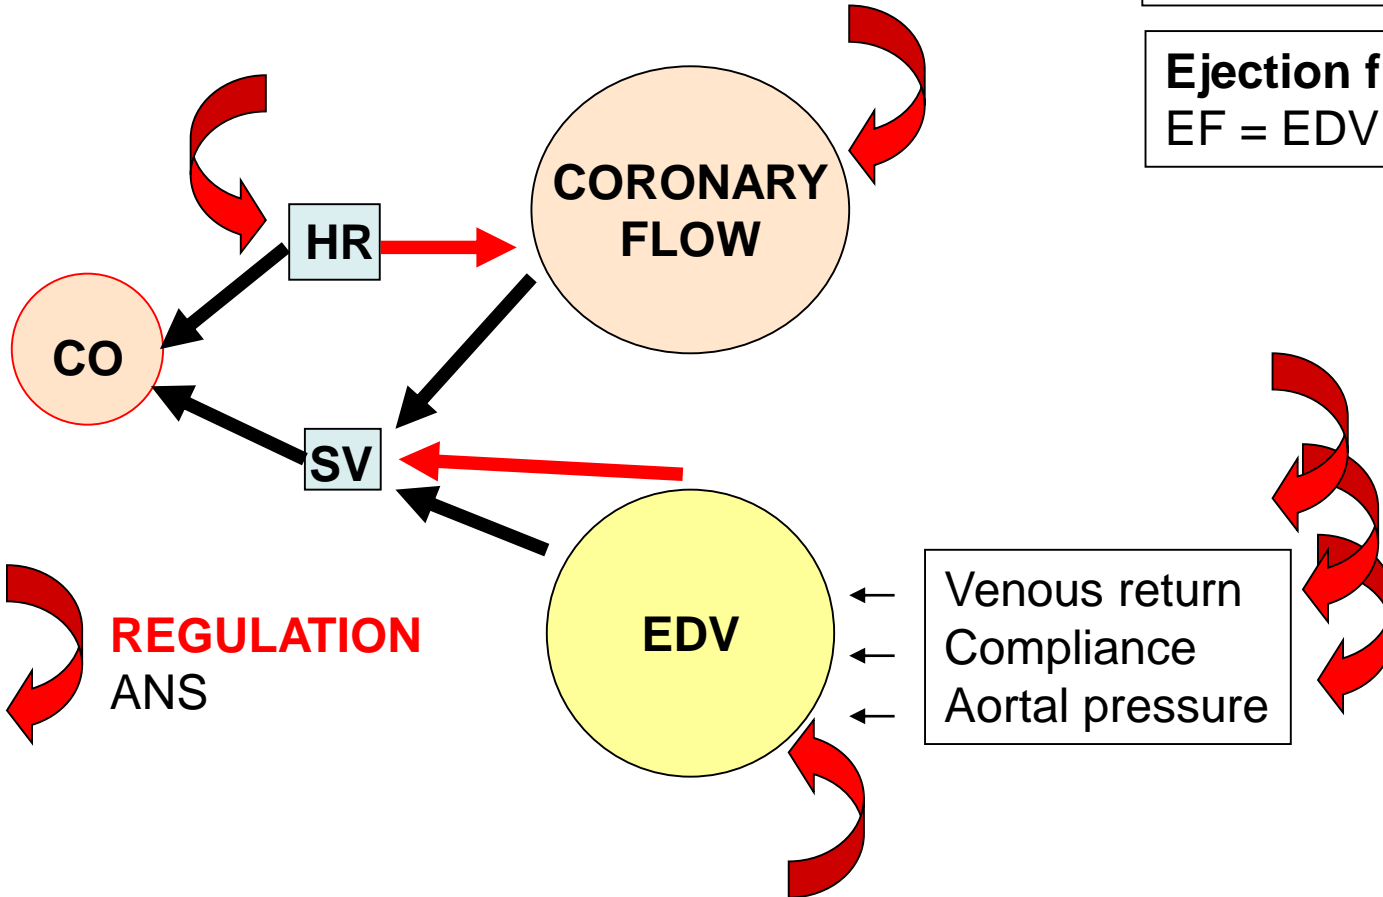

HEART AS A PUMP

CARDIAC CYCLE

HEART FAILURE

CARDIAC OUTPUT (CO)

$$LV = RV$$

$$CO = HR \times SV \quad 5l/min$$

$$SV = EDV - ESV \quad 70ml$$

$$\text{Ejection fraction} \quad EF = \frac{EDV - ESV}{EDV} \quad >60\%$$

AUTOREGULATION of cardiac contraction

Heterometric: Starling law

Homeometric: Frequency effect

CONTRACTILITY

Ability to contract

Depends on:.....

CARDIAC RESERVE = maximal CO / resting CO

4 - 7

CORONARY RESERVE = maximal CF / resting CF

3,5

CHRONOTROPIC RESERVE = maximal HR / resting HR

3 - 5

VOLUME RESERVE = maximal SV / resting SV

1,5

CARDIAC INDEX = CO / body surface

CF = coronary flow

CARDIAC RESERVE

CO (l/min)

WORKLOAD (W/kg)

Skeletal, cardiac and smooth muscle – action potential and contraction

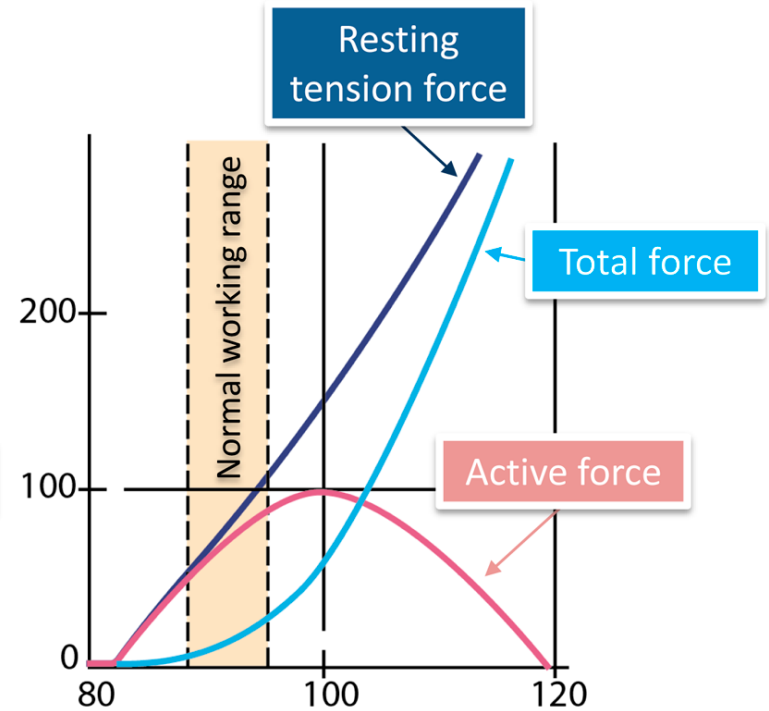

LENGTH – TENSION RELATIONSHIP

1. Striated muscle

Relative muscle length
(length at max. force, $L_{\max} = 100\%$)

2. Cardiac muscle

Relative muscle length
(length at max. force, $L_{\max} = 100\%$)

Passive tension, active tension, isometric contraction, isotonic contraction, auxotonic contraction

STARLING LAW

Henry Pickering Bowditch
(1840 – 1911)

HOMEOMETRIC AUTOREGULATION (FREQUENCY EFFECT)

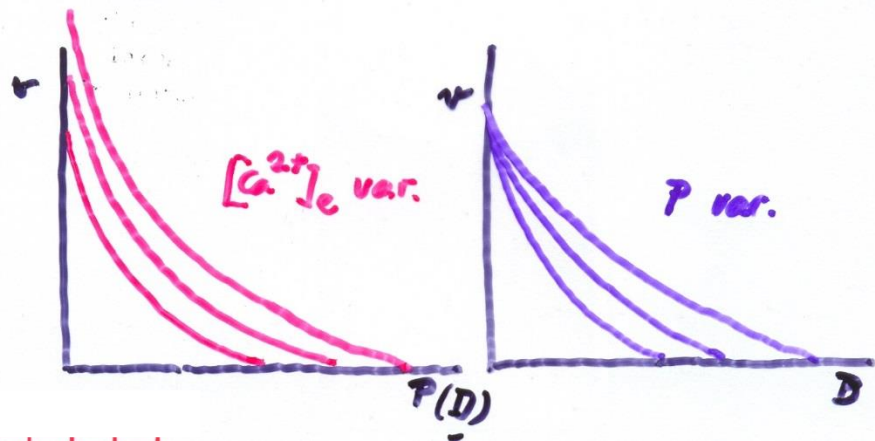

During increasing HR (stimulation frequency) the force of developed contraction rises
Ratio between intra- and extracellular calcium concentrations increases

AFTERLOADED CONTRACTION

PRELOAD, AFTERLOAD

AB – isovolumic contraction
 BC – ejection
 CD – isovolumic relaxation
 DA – filling

LAPLACE LAW

$$T = P \cdot r / h$$

$$\uparrow P = T \uparrow h / \downarrow r$$

HYPERTROPHY

1. $\uparrow T = \uparrow VO_2$
2. $\uparrow h$

PRELOAD

AFTERLOAD

$P = T \cdot 2h \cdot r^{-1}$ **Ventricular filling:** r and T rise, P first falls down, then rises up

(length/tension relationship)

$P = T \cdot 2h \cdot r^{-1}$ **Isovolumic contraction:** T rises up, valves closed – increase in P

$P = T \cdot 2h \cdot r^{-1}$ **Ejection:** r decreases, h rises, thus P increases (even at the same T)

$P = T \cdot 2h \cdot r^{-1}$ **Isovolumic relaxation:** T decreases, valves closed – decrease in P

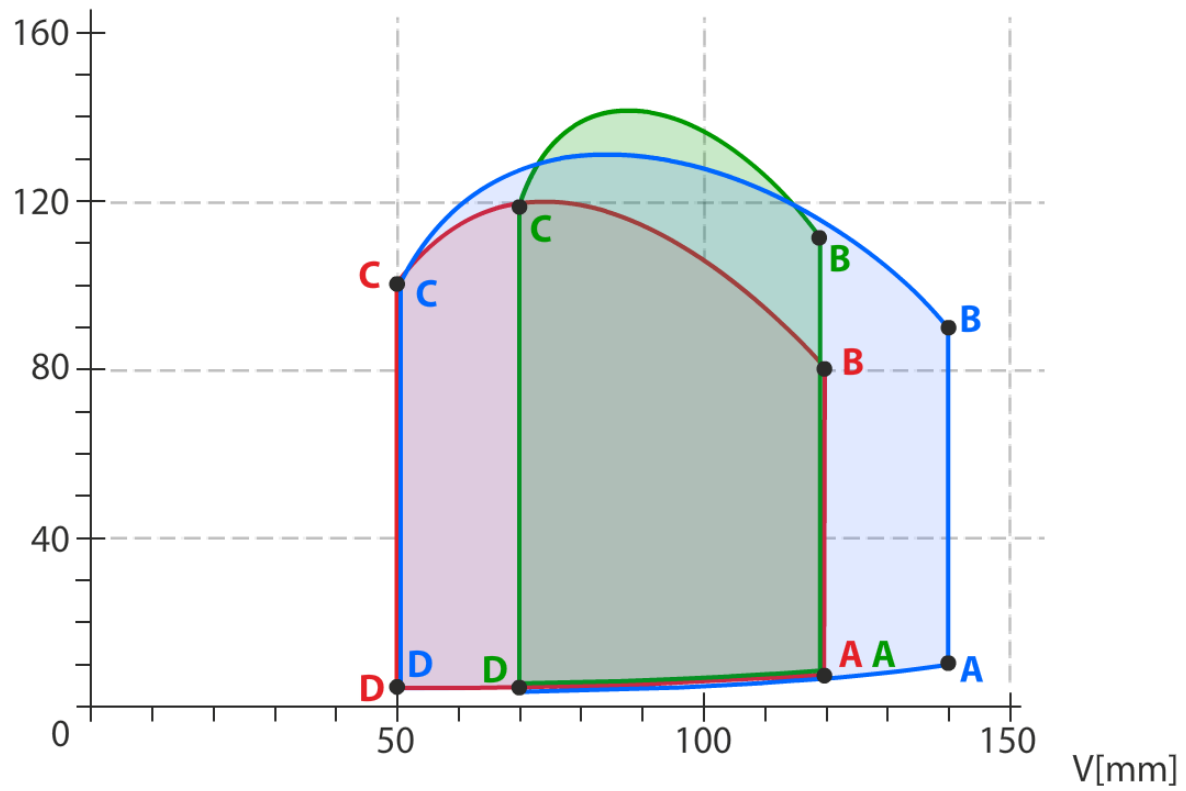

P[mm Hg]

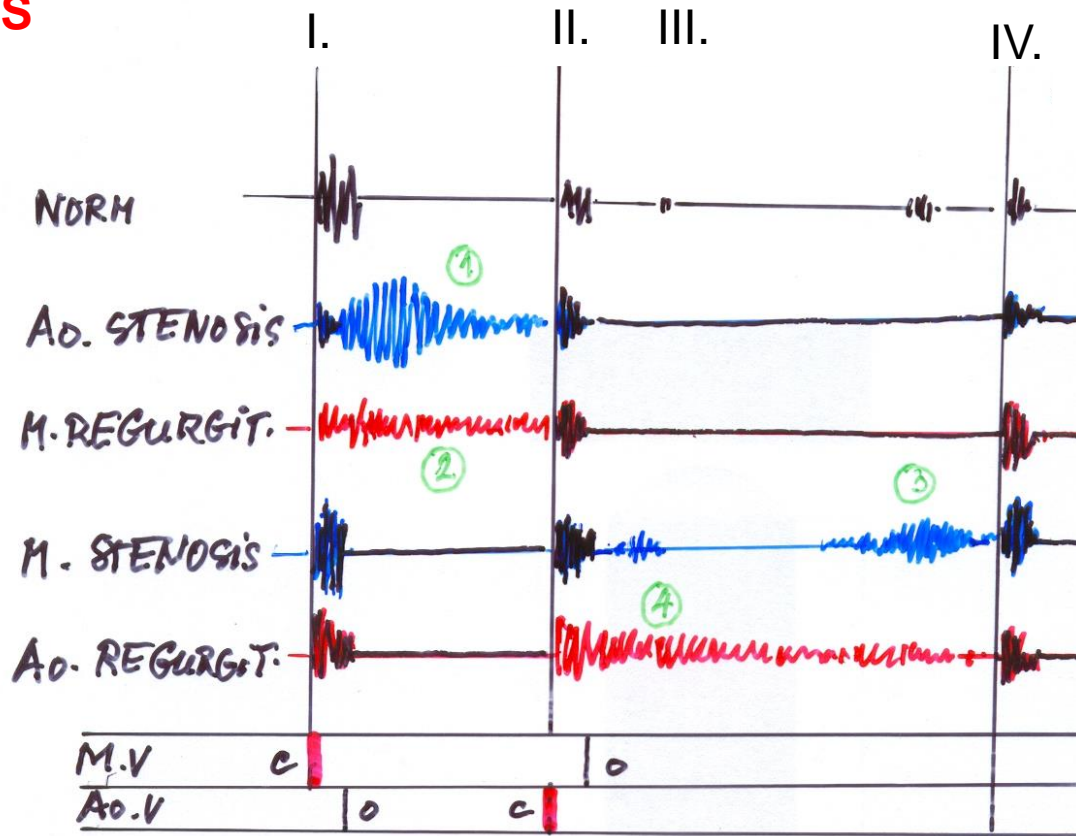

P[mm Hg]

P[mm Hg]

HEART SOUNDS

- I. - mitral (+ tricuspidal) valve closure
- II. - aortal (+ pulmonary) valve closure
- III. - fast filling of ventricles - pathological
- IV. - contraction of atria - mostly pathological

Caused by vibration of:

- Closure and stretching of valves
- Izovolumic contraction of heart muscle (papill. muscles, tendons)
- Turbulent blood flow

Vibration of ventricular wall

MURMURS – pathological phenomena

TURBULENT BLOOD FLOW

1. SYSTOLIC:

- Stenosis – aortal, pulmonary (1)
- Regurgitation – mitral, tricuspidal (2)

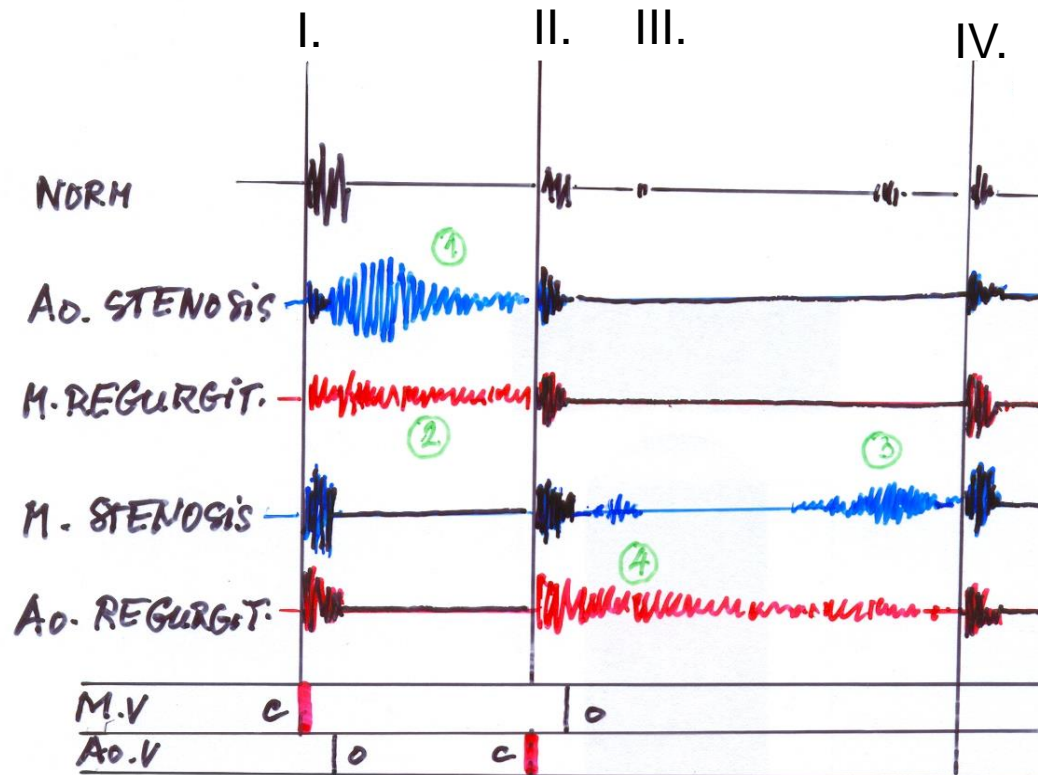

2. DIASTOLIC:

- Stenosis – mitral, tricuspidal (3)
- Regurgitation – aortal, pulmonary (4)

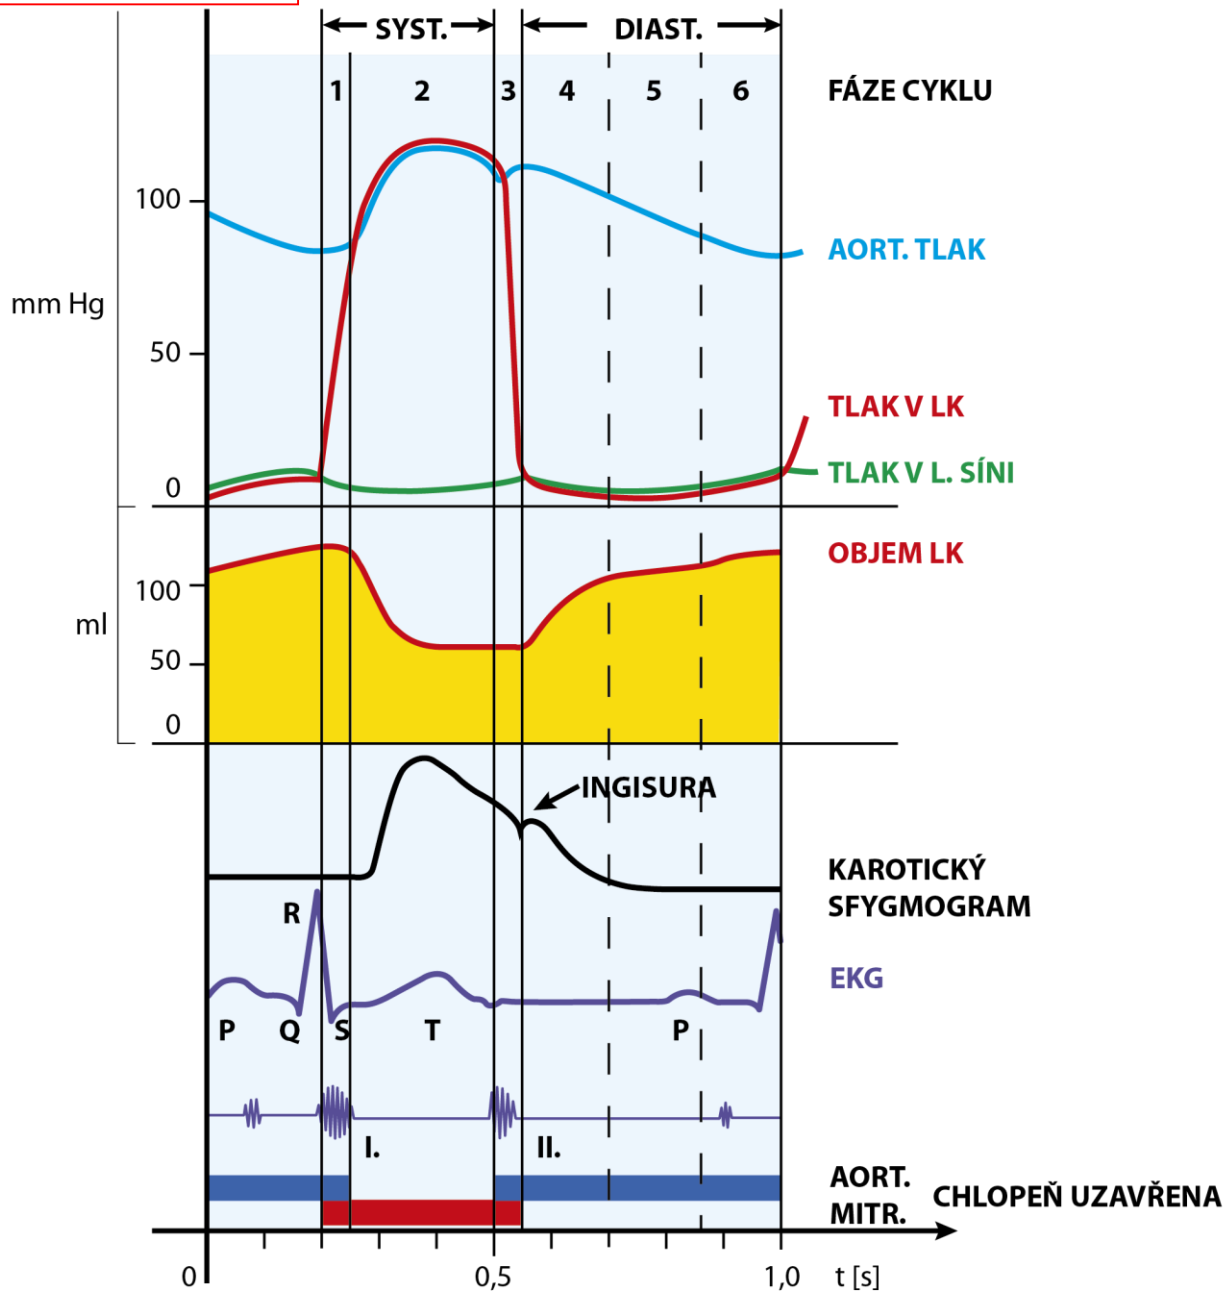

3. SUSTAINED:

- Defects of septum

Splitting of I. or II. sound:
asynchronous closure of
M - T valve (I.)
or Ao - P valve (II.)
(inspiration,
hypertension....)

POLYGRAPHY (polygram)

HEART FAILURE

The heart is not able pump sufficient amount of blood into periphery at normal venous return.

MOST OFTEN CAUSES:

- Severe arrhythmias
- Overload – *volume* (aortal insufficiency, a-v shunts) or *pressure* (hypertension and aortal stenosis – left overload, pulmonary hypertension and stenosis of pulmonary valve – right overload)
- Cardiomyopathy

SYMPTOMS: fatigue, oedemas, venostasis, dyspnoea, cyanosis

ACUTE x CHRONIC. COMPENSATED x DECOMPENSATED.

HEART FAILURE COMPENSATION

BAROREFLEX

Physiological role: compensation of decrease in minimal volume of circulating fluids

Signal: BP decrease (orthostase, work vasodilatation)

Sensor: baroreceptors

Response: activation of SAS (increased HR, inotropy, BP)

Pathological signal: long-lasting decrease of BP due to heart insufficiency

Results: increased energy outcome – **vicious circle**

ACTIVATION OF RAAS

Physiological role: compensation of loss of circulating fluids (bleeding)

Signal: decrease in renal perfusion

Sensor: juxtaglomerular system of kidney

Response: BP increase (angiotenzin II.), water retention (aldosteron)

Pathological signal: decrease in renal perfusion due to heart insufficiency

Results: increased preload and afterload, increased energy outcome – **vicious circle**

DILATATION (STARLING PRINCIPLE)

Physiological role: compensation of momentary right-left differences

Signal: orthostase, deep breathing, beginning of exercise

Pathological signal: continual blood stasis in the heart

Results: increased energy outcome – **vicious circle**

HYPERTROPHY

Physiological role: preservation of energetically demanding tension of ventricular wall

Signal: $P = \sigma \cdot 2 h / r$, intermittent BP increase (athletes heart)

Response: concentric remodelling

Pathological signal: continual increase of preload or afterload

Results: worsening of oxygenation, fibrotisation – **vicious circle**
