

POSSIBILITIES OF SURGICAL MANAGEMENT OF DEGENERATIVE DISORDERS OF THORACIC AND LUMBAR SPINE

Degenerative disorders of discs (osteochondrosis)

- stadium of dysfunction 15 - 35 yrs
- stadium of instability 35 – 55 yrs - herniae
- stadium of stabilisation from 55 yrs - stenoses

Back pain

- Bones, joints, ligaments, muscles, tendons
- Mechano-
- Chemoreceptors
- Dorsal root ganglion – neuropeptides
- Lig longit post – the most sensitive of all lumbar spine ligaments

Radicular pain

- Due to compression
- Chemical irritation
- Irritation of dorsal root ganglion - DRG
 - electrical impulses
 - neuropeptides synthesis – VIP (vasoactive intestinal peptid, substance P)

Levels of evaluation

- anamnesis,
- subjective - VAS score 0-10
- objective,
- imaging methods, X-ray, MRI
- laboratory,
- internal exam
- neurological exam – level of lesion, EMG

Pain

- Acute – chronic (>3 months)
- **Nociceptive** – injury, degen arthritis, inflammation
- **Neuropatic** – damage of neural system (brain, spinal cord, nerve roots, perif nerves)
- **Mixed** – low back pain with nerve compression
- Damage: functional – structural - mixed
- Simulation - dissimulation

Risk factors of pain

- Older age
- Bad physical and psychic condition
- psychic stress
- genetic disposition
- obesity
- hypokinesis
- abuse of alcohol and smoking
- Sedentary work
- Heavy physical work

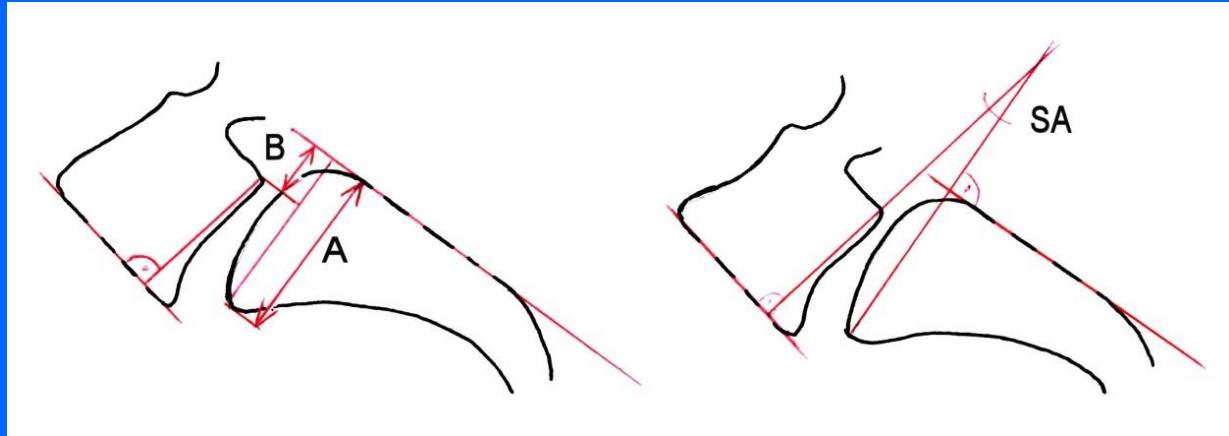

Etiology due to damage tissue

- discogenic,
- vertebrogenic,
- myogenic,
- neurogenic, B Neuropathic
- vascular - vasogenic
- viscerogenic – from internal organs,
- psychogenic,

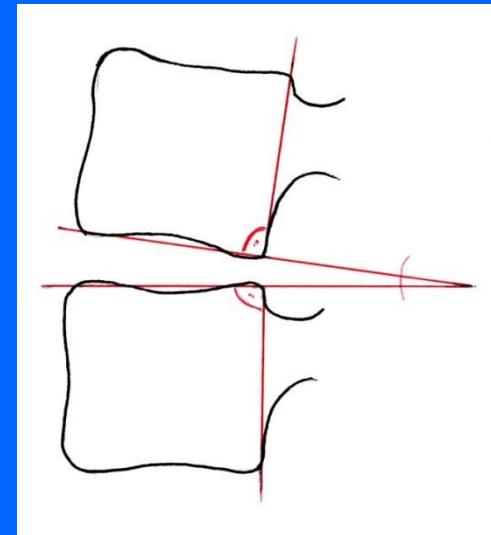

Evaluation

- Structural Psychological
 - X-ray, standing, will
 - functional
 - MRI cooperation
 - Functional Social
 - Neurological - EMG

Method of Wiltse a Winter

Dupuis et al.

Instability: flexion/extension

- translational $\geq 8\%$
- rotatory $> 11^\circ$

Wood et al.

1994

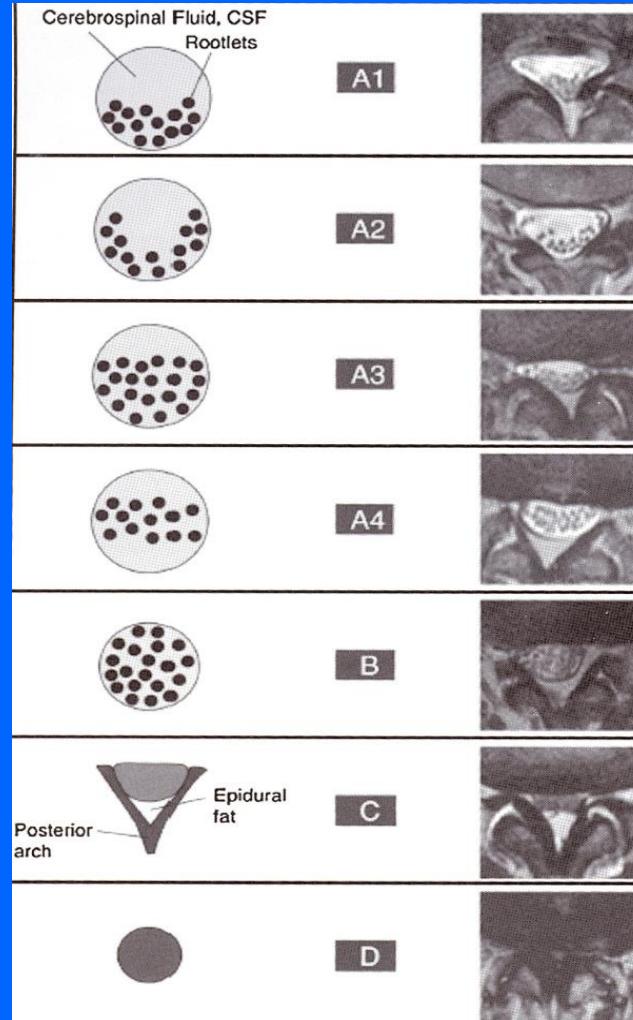

Louis

1985

Wood et al.

1994

Schizas et al. Spine 2010, 35, 21, 1919-1924
Classification of lumbar spinal stenosis

Surgery: C, D

Conservative tx and tx after surgery

- Regime measures – changing of positions, ergonomics
- Limitation of stress – no carrying and lifting of loads/weights
- physiotherapy – isometry + strengthening of muscles, correct posture, respiratory physiotherapy, .. – effect after 3 months
- Exercises daily, permanently
- Temporary use of orthoses

Indication of surgical tx

Depletion of conservative tx of

- - deformities (spondylolisthesis)
- - spinal stenosis
- - instabilities
- - worsening of neural deficit (herniae, stenosis)
- - clear origine of pain
- - corresponding clinical + radiological finding

Correlation

- Subjective difficulties
- Clinical finding
- Neurological examination
- Imaging methods – X-ray, MRI
- Psychological condition

Possibilities of surgical tx

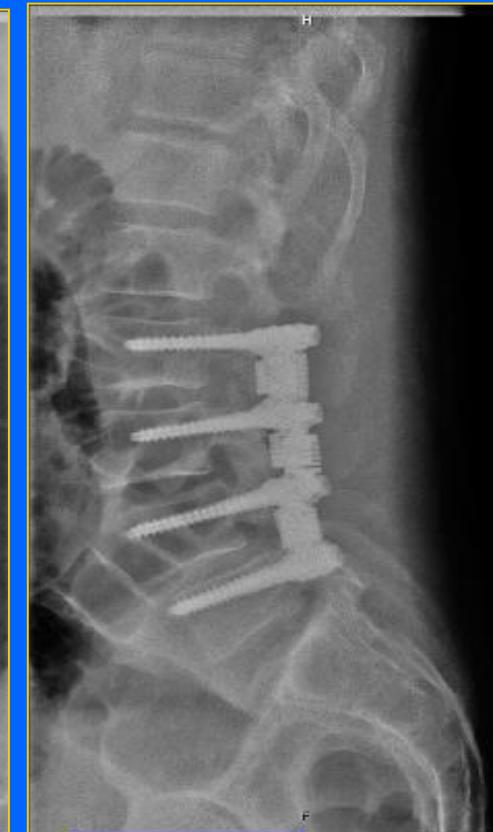

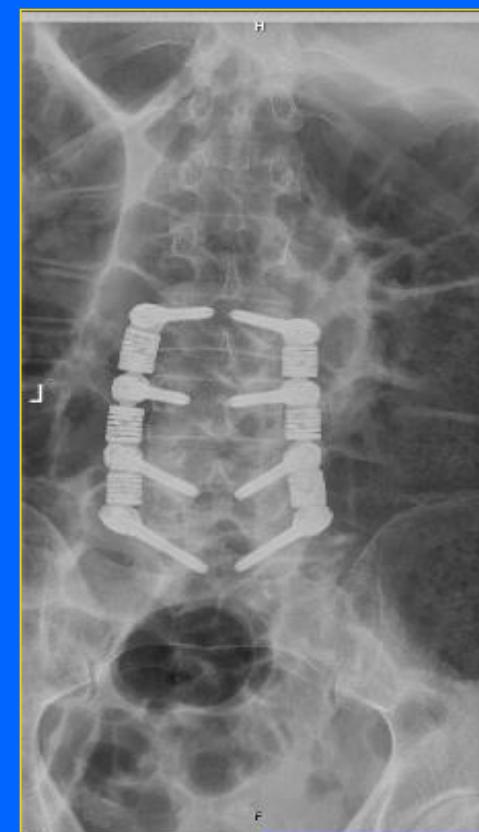

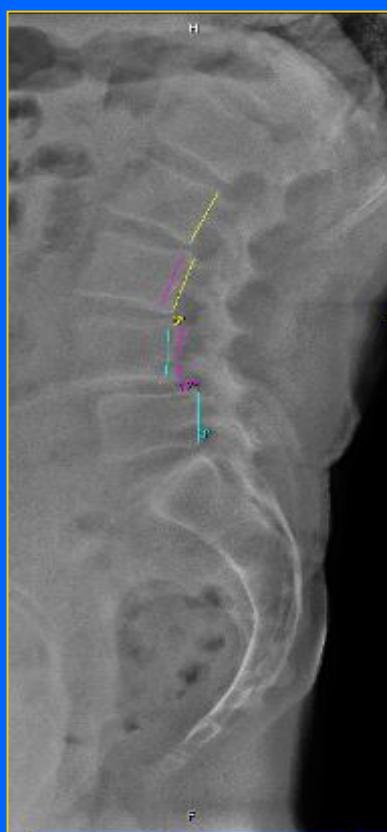

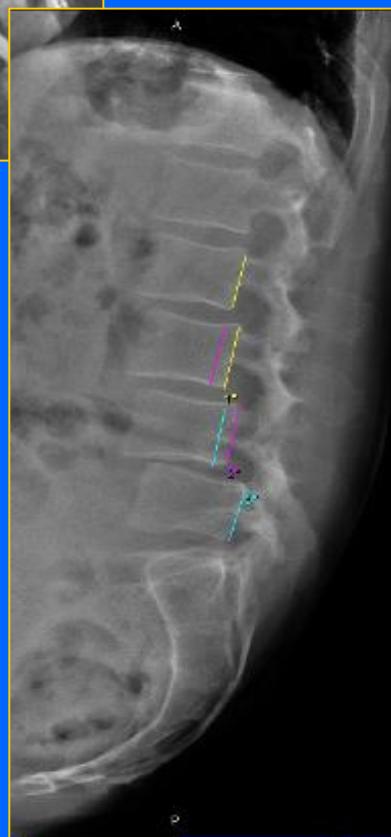

- Decompression
- Decompression + dynamic stabilisation
- Dynamic stabilisation – posterior – (anterior)
- Posterolateral fusion + transpedicular instrumentation
- 360° fusion + transpedicular fixation with deformities correction – special cages for PLIF, TLIF, (ELIF, ALIF)
- (Anterior - ALIF - special cages)

ALIF - anterior lumbar interbody fusion, special cages

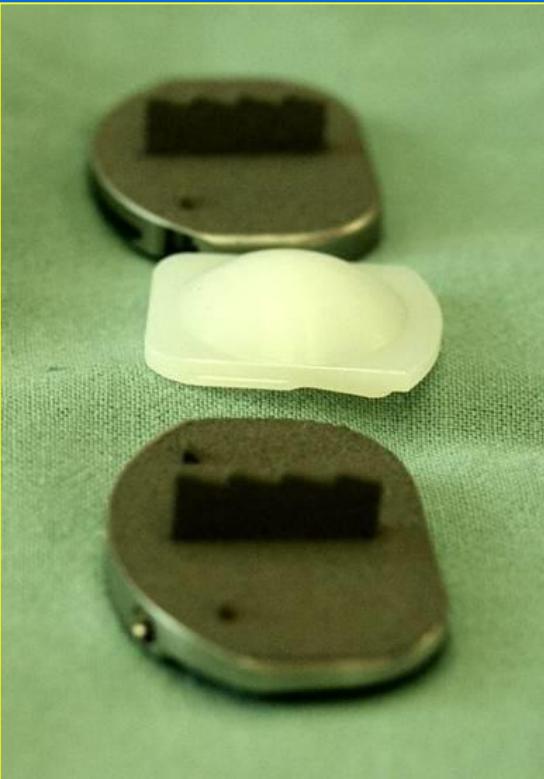

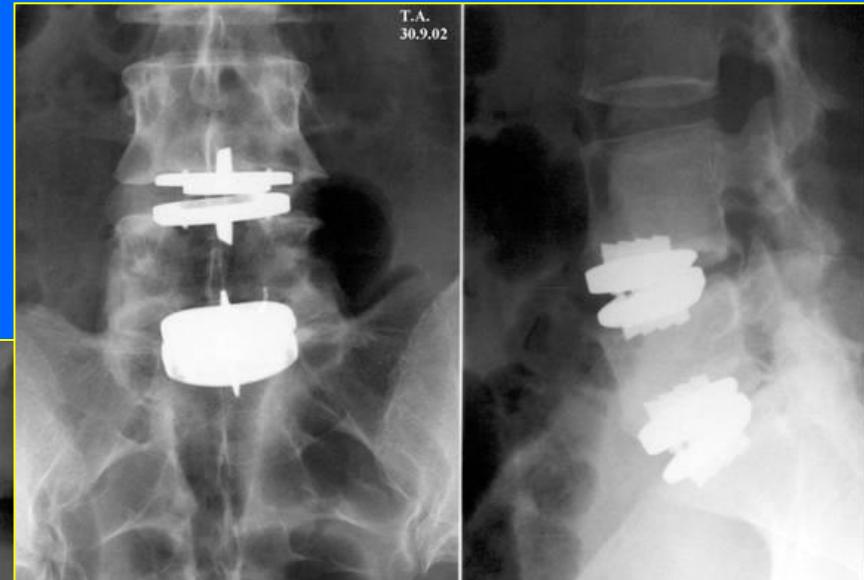

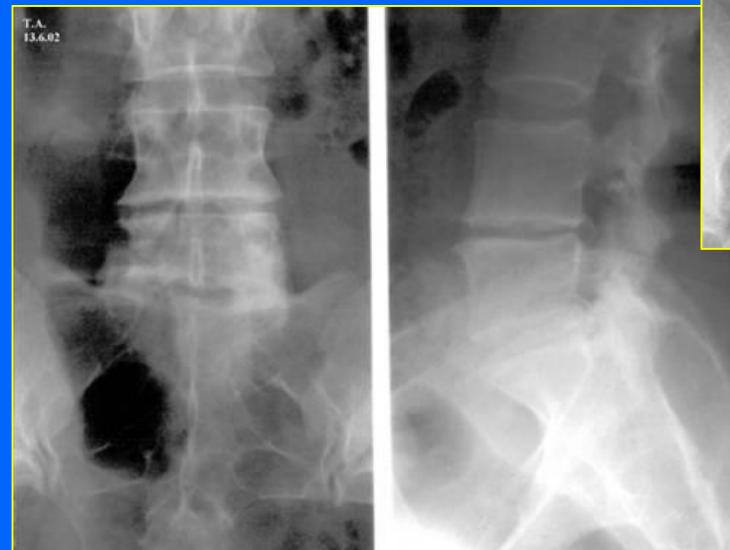

Dynamic stabilisation –
posterior

Mobile disc prosthesis - endoprosthesis, limited use

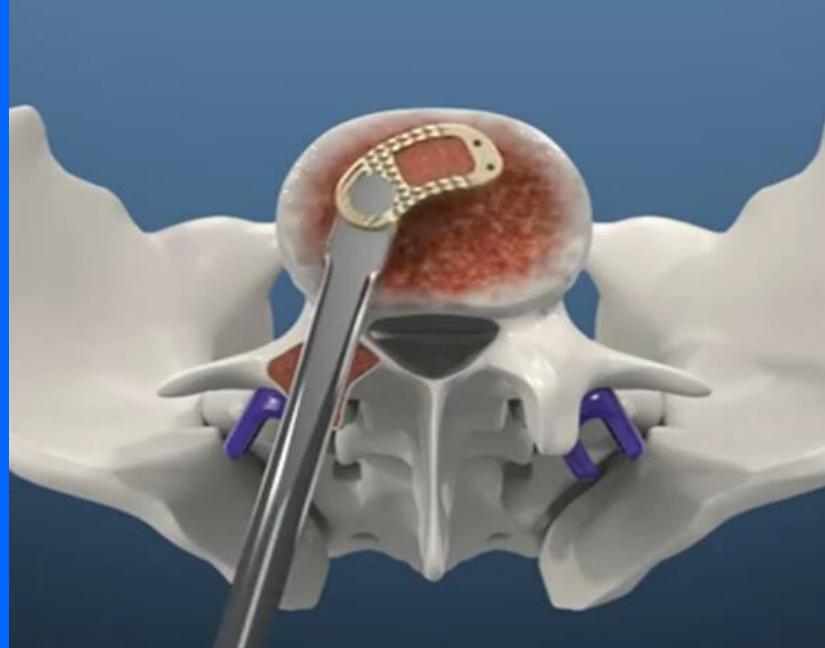

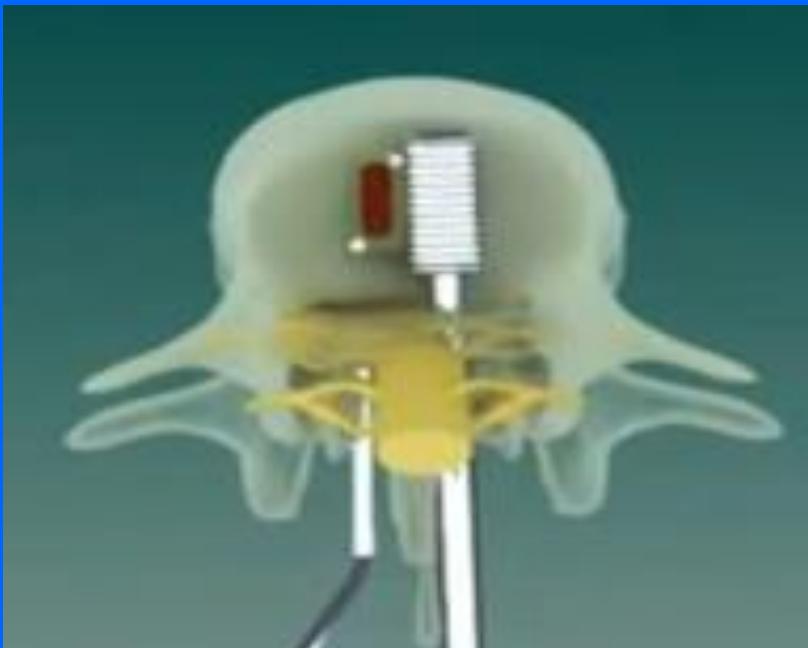

360° fusion – PosteroLateral fusion- bone grafts, transpedicular fixation +

PLIF

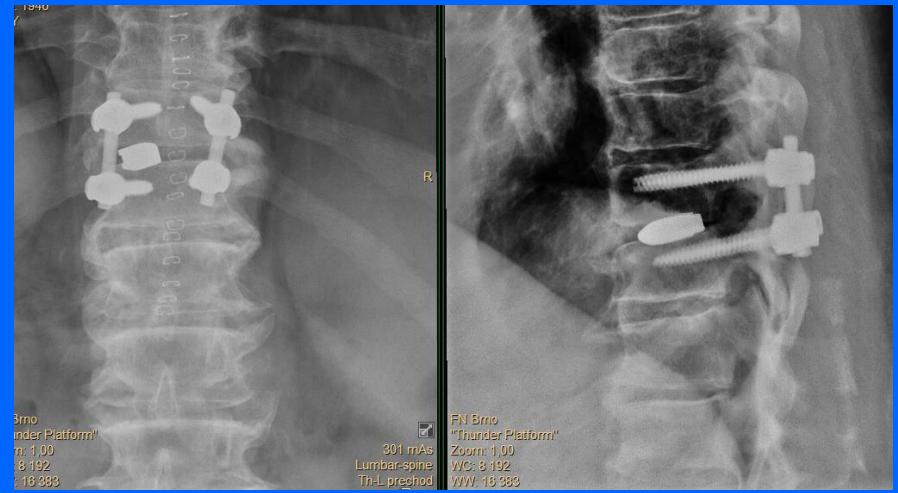

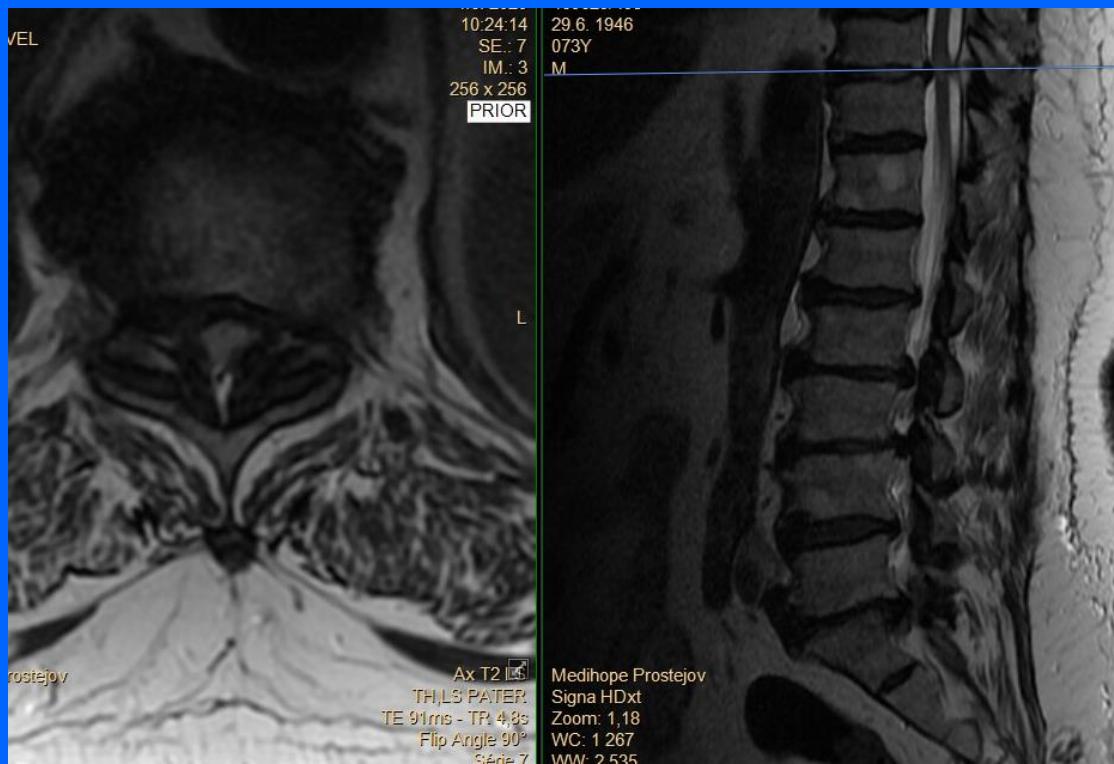

Posterior lumbar...
interbody fusion – special cages

TLIF

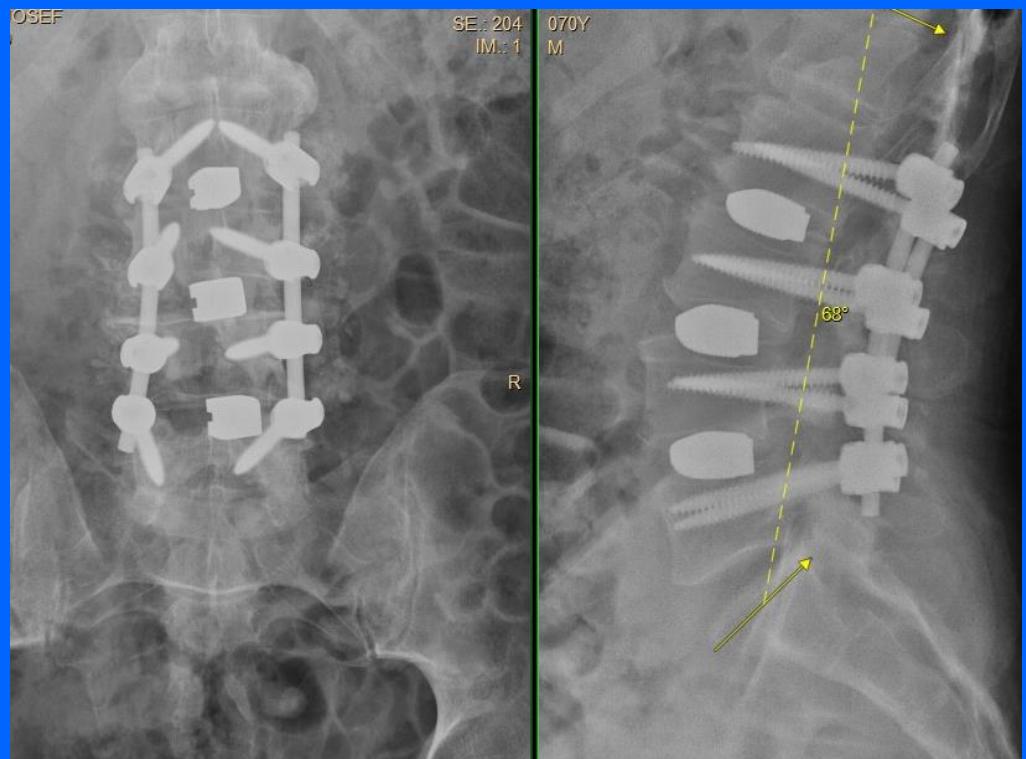

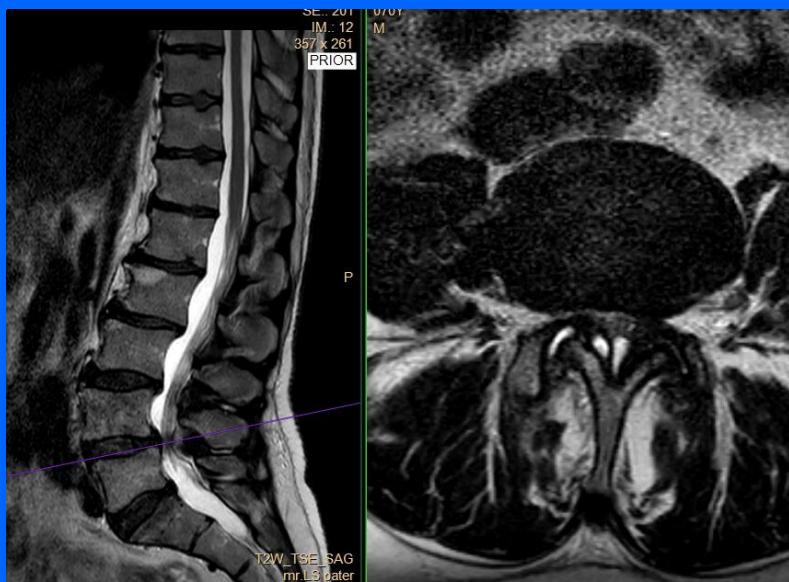

transforaminal lumbar
interbody fusion – special cages

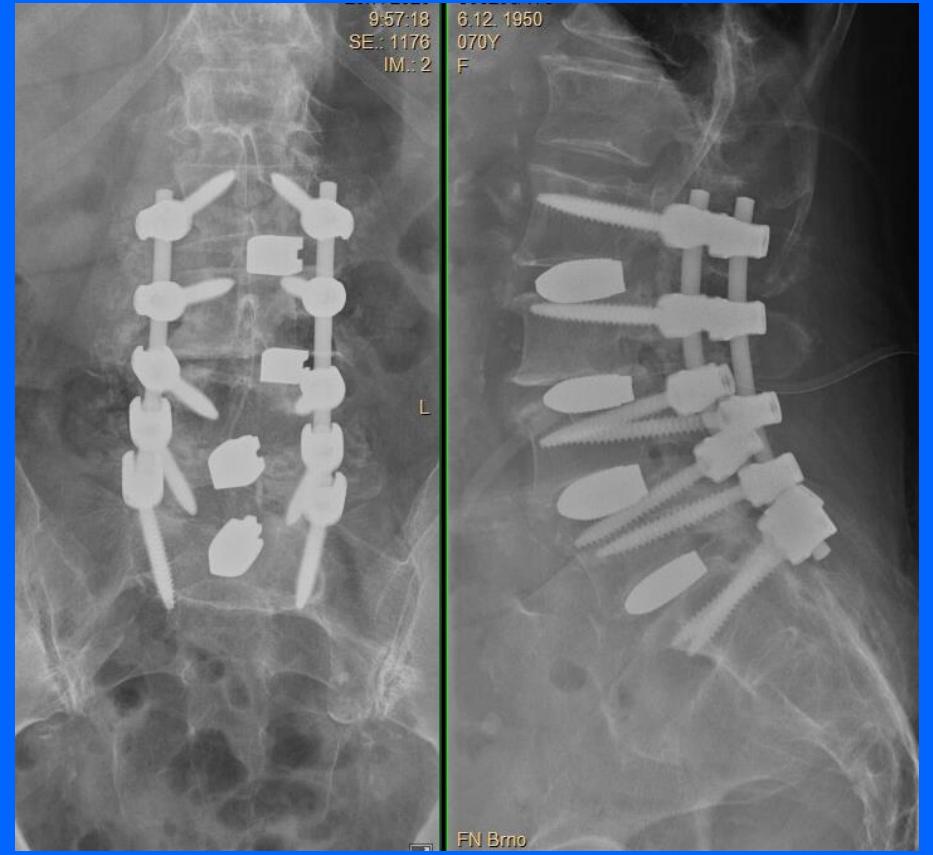

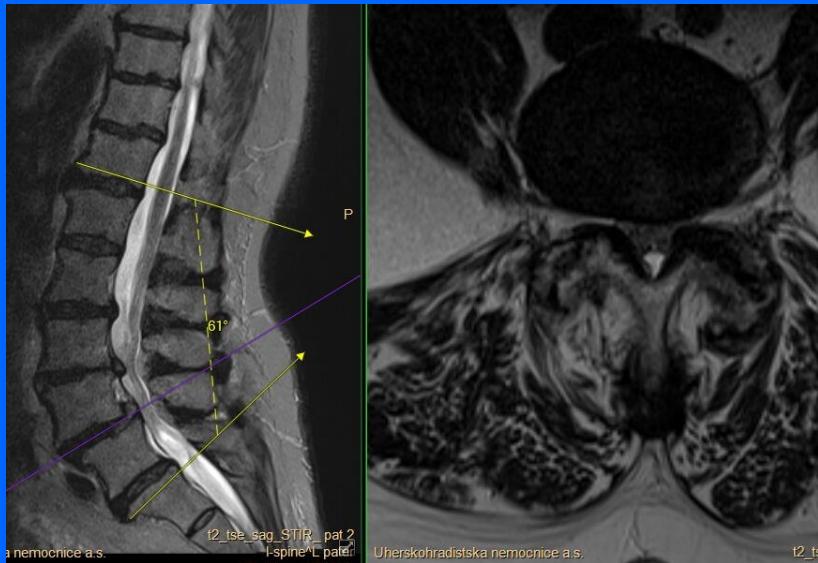

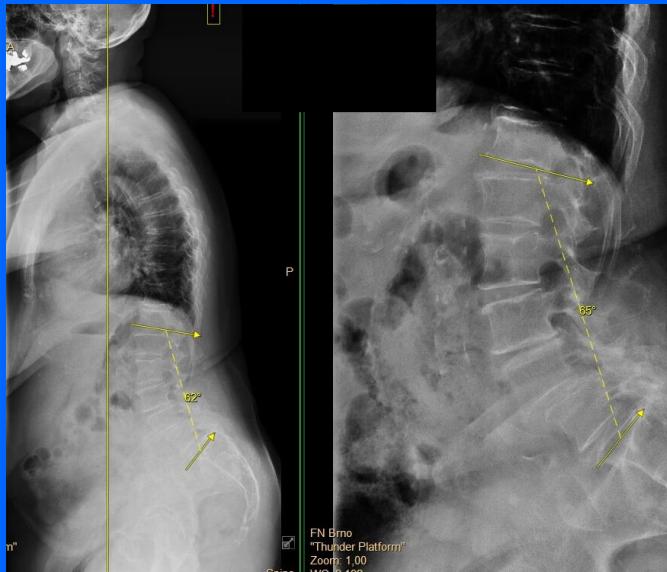

M 73 yrs, gait disturbance, Lumbar Spinal Stenosis T10-11 – 360° fusion, TLIF

M70 yrs, pain, gait disturbance, radicular S1 pain – 360° fusion + TLIF L2-5

F 70 yrs, neurogenic claudications,
radiculopathy L4, slip L4, L5 – sagittal
imbalance, L2-S1 360° fusion
with cages

Conclusion – surgical tx

After depletion of conservative tx:

- - deformities (spondylolisthesis)
- - stenosis
- - instability
- - worsening of neural deficit (herniae, stenoses)
- - clear origine of pain
- - corresponding clinical + radiological finding
