

Axis TRH-TSH-T3/T4

# TRH, thyrotropin-releasing hormone

## Characteristics

- Peptide with central effects – neuromodulation, thermoregulation
- Peripheral effects

## Hypothalamo-hypophyseal axis

- Regulation of TSH and PRL secretion (prolactinemia, galactorea)

## Clinical significance

- In the past – hyperthyroidis diagnosis (hypothalamic X hypophyseal causes)
- Possible role in depression treatment, spinal muscular atrophy and amyotrophic lateral sclerosis
- Treatment of some syndromes (West, Lannox-Gastaut, early infantile epileptic encephalopathy)

## Regulation of secretion

- Neural control
- Circadian rhythm (maximum between 21:00 and 5:00 and between 16:00 and 19:00, peaks in 90–180 min intervals)
- Temperature (cold) – higher synthesis among people from colder regions in winter – together with ANS (catecholamines)
- Stress – TRH synthesis and secretion inhibition (indirect negative feedback loop between glucocorticoids and effect on hippocampus)
- Starvation – TRH secretion decrease („saving“ energy); effect of leptin
- Body mass - POMC (-) and ARGP (+) system

# TSH, thyroid stimulating hormone

## Characteristics

- Heterodimer
- Negative feedback T3 – inhibition of  $\alpha$  subunit transcription; dopamine ( $\alpha$  and  $\beta$ )
- Positive feedback – TRH

## TSH

- Half-life ca 30 min
- Pulsatile secretion (2-3 h), circadian rhythms (peak between 23:00 and 5:00)
- Magnitude changes – starvation, disease, surgery
- Leptin, ADH, GLP-1, glucocorticoids,  $\alpha$ -adrenergic agonists, prostaglandins, TRH (+)
- T3/T4, dopamine, gastrin, opioids, glucocorticoids (high doses), serotonin, CCK, IL-1 $\beta$  a 6, TNF- $\alpha$ , somatostatin (-)

## Function

- Stimulation of thyroid hormones synthesis
- „Growth hormone“ for thyroid gland

## Clinical significance

- TSH deficiency (mutation in genes coding TRH and TSH receptors)
- Analogues of somatostatin
- ! (+) cortisol metabolism

**Feedback mechanism!**

# Thyroid gland

- *Glandula thyroidea* (15 - 20 g, frontal side of trachea under thyroid cartilage)
- Two lobes connected by thyroidal isthmus, *lobus pyramidalis*
- Strong vascularization
- Round follicles (acini) with one layer of **follicular cells (T3/T4)**
- Cavity filled with colloid
- Capillaries with fenestrations
- **Parafollicular (C-) cells (calcitonin)**
- From day 29 of gravidity (Tg), T4 – 11th week

**Figure 49-1** Structure of the thyroid gland. The thyroid gland is located anterior to the cricoid cartilage in the anterior neck. The gland comprises numerous follicles, which are filled with colloid and lined by follicular cells. These follicular cells are responsible for the trapping of iodine, which they secrete along with thyroglobulin—the major protein of the thyroid colloid—into the lumen of the follicle.

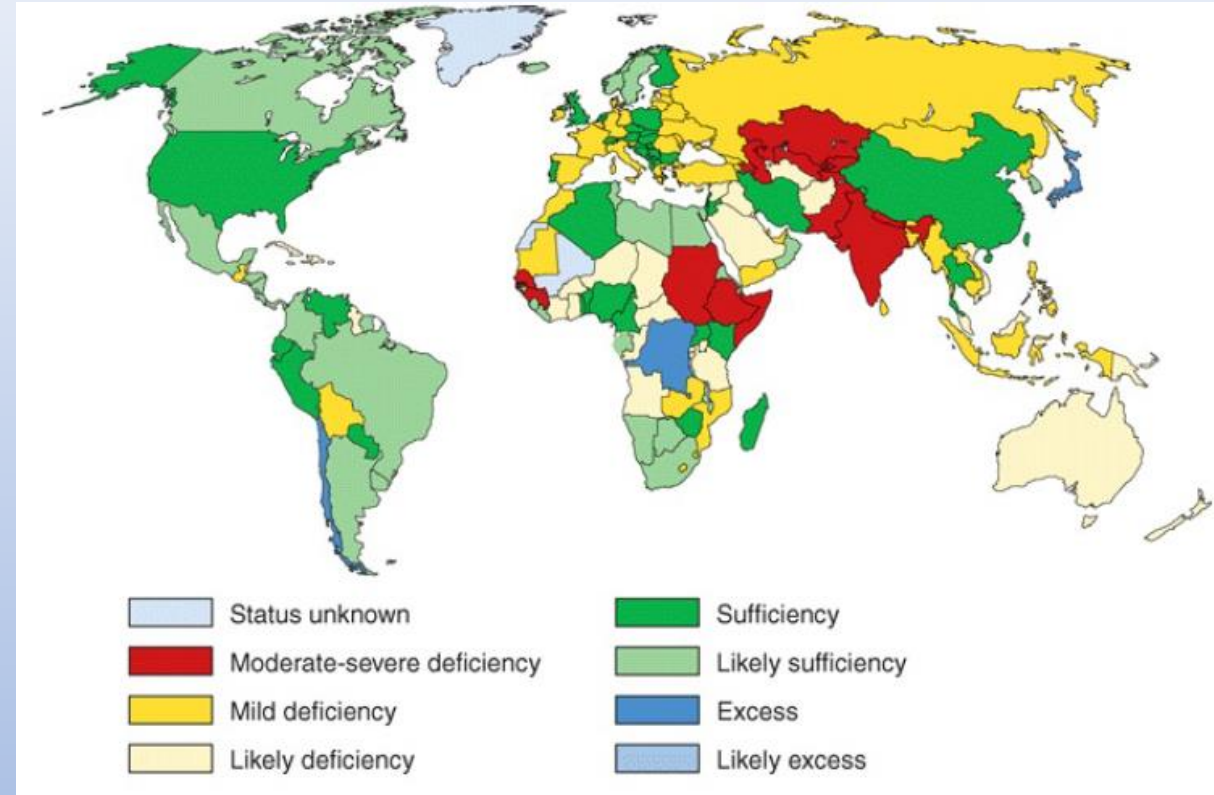

**Follicles are the basic functional units of thyroid gland**

# Dietary iodine

Recommended Daily Intake	
Adults	150 $\mu\text{g}$
During pregnancy	200 $\mu\text{g}$
Children	90-120 $\mu\text{g}$
Typical Iodine Daily Intakes	
North America (1992)	75-300 $\mu\text{g}$
Chile (1981)	<50-150 $\mu\text{g}$
Belgium (1993)	50-60 $\mu\text{g}$
Germany (1993)	20-70 $\mu\text{g}$
Switzerland (1993)	130-160 $\mu\text{g}$

- Bioavailability of organic and inorganic I
- breast milk
- I<sup>-</sup> filtered with passive reabsorption 60 – 70 %
- loss through stool (10 – 20  $\mu\text{g}/\text{day}$ )

- Highest daily intake in Japan (several mg)
- In many countries on decrease – eating habits

## Clinical relevance

- Endemic goiter
- Endemic cretinism

# Iodine and hormone secretion – general view

- NIS ( $\text{Na}^+/\text{I}^-$  symporter)
- PDS (pendrin)
- TPO (thyroidal peroxidase)
- TG homodimers and their iodation – MIT and DIT
- DUOX1 and 2 – together with TPO oxidation of iodide and transportation to TG structure
- TPO - connection DIT+DIT ( $\text{T}_4$ ) or DIT+MIT ( $\text{T}_3$ )
- Pinocytosis and phagolysosomes
- Deiodation of MIT and DIT – DEHAL1 (iodotyrosine dehalogenase)

- Other proteins (TSHR)
- Transcriptional factors (TTF-1, TTF-2, PAX8, HNF-3)

# T3 and T4 secretion

- High supply vs low daily turnover (about 1 %)
- Supply ca 5000  $\mu\text{g}$  T4 – euthyroid state for ca 50 days

- Macropinocytosis and **micropinocytosis** (apical membrane)
- Endocytosis
- Selective proteolysis (cathepsin D and D-like thiol proteases, active at low pH)
- Release from Tg in lysosomes
- T4 available to deiodases D1 and D2 – modulation of systemic conversion?
- Inhibition of T4 secretion by iodide

## TSH and T3, T4 secretion

- TSHR
  - TSH binding
  - TRAb (TSHR-stimulating antibody )
  - TBAb (thyroid-blocking antibodies )
  - LH (+)
  - hCG (+)
- PLC +  $\text{Ca}^{2+}$ 
  - iodide efflux, peroxide generation, iodation of Tg
- PKA
  - iodide uptake
  - Tg transcription
  - transcription and generation of TPO and NIS

# T3 and T4 transport

## TBG

- Glycoprotein
- One binding site for iodothyronine
- Half-life ca 5 days

## Transthyretin

- Binds one T4 molecule, low affinity
- Half-life ca 2 days
- CSF – relevance ?

## Albumin

- Low affinity
- Little relevance for T3/T4 transport (max. 10 %)

Other – lipoproteins (3 – 6 %)

Parameter	Thyroxine-Binding Globulin	Transthyretin	Albumin
Molecular weight of holoprotein (kDa)	54,000	54,000 (4 subunits)	66,000
Plasma concentrations ( $\mu\text{mol/L}$ )	0.27	4.6	640
T <sub>4</sub> binding capacity as $\mu\text{g T}_4/\text{dL}$	21	350	50,000
Association constants of the major binding site (L/mol)			
T <sub>4</sub>	$1 \times 10^{10}$	$7 \times 10^7$	$7 \times 10^5$
T <sub>3</sub>	$5 \times 10^8$	$1.4 \times 10^7$	$1 \times 10^5$
Fraction of sites occupied by T <sub>4</sub> in euthyroid plasma	0.31	0.02	<0.001
Distribution volume (L)	7	5.7	7.8
Turnover rate (% day)	13	59	5
Distribution of iodothyronines (% protein)			
T <sub>4</sub>	68	11	20
T <sub>3</sub>	80	9	11

T<sub>3</sub>, triiodothyronine; T<sub>4</sub>, thyroxine.

**Low solubility of iodothyronines determines their reversible binding and transport by plasmatic proteins.**

**TBG concentration and saturation is the main free-T4 determinant.**

# Deiodination and (seleno-)deiodinases\*

- all deiodinases require thiol presence as cofactor (glutathione (GSH), thioredoxin (TRX), glutaredoxin (GRX))
- D1 - main source of plasmatic T<sub>3</sub>
- D3 - most important „deactivating“ enzyme over-expressed in tumor tissue

Parameter	Type 1 (Outer and Inner Ring)	Type 2 (Outer Ring)	Type 3 (Inner Ring)
Physiologic role	rT <sub>3</sub> and T <sub>3</sub> S degradation, the source of plasma T <sub>3</sub> in thyrotoxic patients	Provide intracellular T <sub>3</sub> in specific tissues, a source of plasma T <sub>3</sub>	Inactivate T <sub>3</sub> and T <sub>4</sub>
Tissue location	Liver, kidney, thyroid, pituitary (?) (not CNS)	CNS, pituitary, BAT, placenta thyroid, skeletal muscle, heart	Placenta, CNS, hemangiomas, fetal or adult liver, skeletal muscle
Subcellular location	Plasma membrane	Endoplasmic reticulum	Plasma membrane
Preferred substrates (position deiodinated)	rT <sub>3</sub> (5'), T <sub>3</sub> S (5)	T <sub>4</sub> , rT <sub>3</sub> (5')	T <sub>3</sub> , T <sub>4</sub> (5)
K <sub>m</sub>	rT <sub>3</sub> , 10 <sup>-7</sup> ; T <sub>4</sub> , 10 <sup>-6</sup>	10 <sup>-9</sup>	10 <sup>-9</sup>
Susceptibility to PTU	High	Absent	Absent
Response to increased T <sub>4</sub>	↑	↓	↑

BAT, brown adipose tissue; CNS, central nervous system; K<sub>m</sub>, Michaelis-Menten constant; PTU, 6-n-propylthiouracil; rT<sub>3</sub>, reverse triiodothyronine; T<sub>3</sub>, triiodothyronine; T<sub>3</sub>S, T<sub>3</sub>SO<sub>4</sub>; T<sub>4</sub>, thyroxine.

# Sources of intracellular T3 and T4

D2 as a source of supplementary nucleic T3

T3 supply critical for tissues:

- cortex
- BAT
- PIT

Physiological relevance:

- Normal development
- Thyroid gland function regulation
- Cold

Clinical relevance

- Amiodarone (D1/D2 (-))
- Propylthiouracil (D1 (-))
- Glucocorticoids (D3 (+))

Preferential plasmatic T3 utilization

# Physiological effects of thyroid hormones

- Non-nuclear receptors
- Interactions with adaptor proteins

- cAMP
  - MAPK
  - Ca<sup>2+</sup>-ATPase (+)
  - Na<sup>+</sup>/H<sup>+</sup> antiporter (+)
- Cell response

- Regulation of transcriptional activity

- Normal growth and development
- Regulation of metabolism

# Organ-specific effects of thyroid hormones

## Bones

- increase of bone turnover
- regulation of activity of osteoblasts/clasts, chondrocytes
- hyperthyroidism – risk of osteoporosis

## Cardiovascular system

- Inotropic and chronotropic effect
- (+) cardiac output and IVF
- (-) vascular resistance
- changes in transcriptional activity:
  - Ca<sup>2+</sup>-ATPase
  - Phospholamban
  - Myosin
  - β-AR (upregulation and sensitivity)
  - G-proteins, AC
  - Na<sup>+</sup>/Ca<sup>2+</sup> exchanger
  - Na<sup>+</sup>/K<sup>+</sup>-ATPase
  - Voltage-gated ion channels

## GIT

- (+) resorption of monosaccharides
- (+) motility

## Adipose tissue

- (+) differentiation of adipose tissue, adipocytes proliferation
  - (+) lipogenic enzymes
  - (+) cell accumulation of lipids
  - (+) uncoupling proteins, uncoupling of oxidative phosphorylation
  - Hyperthyroidism (+) lipolysis
    - (+) β-AR
    - (-) phosphodiesterase activity
    - (+) cAMP
  - Hypothyroidism (-) lipolysis
- } (+) activity HSL

## Liver

- regulation of triglyceride, lipoprotein and cholesterol metabolism
- (+) fatty acids metabolism
- (+) gluconeogenesis
- (+) mitochondrial respiration

## CNS

- expression of genes related myelination, cell differentiation, migration and signaling
- Axonal growth and further development

# Metabolic effects of thyroid hormones

## Saccharides

- increased glucose resorption
- Increased utilization of Glu in tissues
- Increased liver gluconeogenesis
- Increased glycolysis
  
- hyperthyroidism = postprandial hyperglycaemia
- hypothyroidism = imbalances in glycaemia

## Proteins

- Proteoanabolic effect (mainly during intrauterine development and the first year after birth – brain)
- hyperthyroidism = protein catabolism!

## Lipids

- increased activity of lipoprotein lipase
- Increased synthesis of LDL receptor in hepatocytes
- increased synthesis of fatty acids (nonesterified)
- increased beta-oxidation
- hypothyreosis = proatherogenic changes!

# Thyroid hormones and iodide deficit and excess

## Deficit

- Rapid T4 decrease, TSH increase
- No change in T3
- Increased synthesis of NIS, TPO, Tg, organification of iodide and Tg turnover
- Increase D2 in CNS, hypothalamus and hypophysis
- Stimulation of follicular cells (TSH)
- Long-term deficit – decreased D3
- Decrease supplementation under 75  $\mu\text{g}/\text{day}$  (China, India, Indonesia, Africa)
- hypothyroidismus

## Excess

- At first increase, then decrease of iodide organification (Wolff–Chaikoff effect)
- Long-term high iodide supplementation = hypothyroidism and goitre
- decreased NIS generation
- Immediate inhibition of thyroid hormones secretion

# Thyroid gland functions during disease and starvation\*

## Starvation

- Decreased plasmatic T3, increased rT3, T4 no change
  - Upregulation of D3
  - Decreased oxygen consumption
  - Slower heart rate
  - More positive nitrogen balance
- = mechanisms to save energy and proteins

- Chronic malnutrition – decreased plasmatic T3

## Disease

- Changes in T4 to T3 D2) conversion – TSH binding
- IL-6
- Increased intra-/extracellular ROS = changes in deiodinase activity – decreased T4 to T3 conversion  
BUT! no change in D3
- potential therapy – infusion of TSH + GHRP2

- Bipolar disorder – (+) TSH, (-) T4
- Severe depression – (-) TSH, (+) T4

Severity of Illness	Free T <sub>3</sub>	Free T <sub>4</sub>	Reverse T <sub>3</sub>	TSH	Probable Cause
Mild	↓	N	↑	N	↓ D2, D1
Moderate	↓↓	N, ↑↓	↑↑	N, ↓	↓↓ D2, D1, ? ↑ D3
Severe	↓↓↓	↓	↑	↓↓	↓↓ D2, D1, ↑ D3
Recovery	↓	↓	↑	↑	?

D1 through D3, iodothyronine deiodinases; N, no change; T<sub>3</sub>, triiodothyronine; T<sub>4</sub>, thyroxine; TSH, thyroid-stimulating hormone (thyrotropin).

# Hormones and thyroid gland

## Glucocorticoids

- Decreased pulsatile secretion of TSH and TRH secretion
- Increased activity (expression) of D3

## Sex steroids

- Estrogens
  - increased TBG
  - TSH (+ 15 – 20 %)
- Androgen
  - decreased TBG

## GH

- (+) T3, (-) T4
- Deiodinase

## Glucocorticoids

### *Excess*

- Decrease TSH, TBG, TTR (high-dose)
- Decrease serum  $T_3/T_4$  and increase  $rT_3/T_4$  ratios
- Increase  $rT_3$  production (?  $\uparrow$  D3)
- Decrease  $T_4$  and  $T_3$  secretion in Graves disease

### *Deficiency*

Increase TSH

## Estrogen

- Increase TBG sialylation and half-life in serum
- Increase TSH in postmenopausal women
- Increase  $T_4$  requirement in hypothyroid patients

## Androgen

- Decrease TBG
- Decrease  $T_4$  turnover in women and reduce  $T_4$  requirements in hypothyroid patients

## Growth Hormone

Decrease D3 activity

D3, type 3 deiodinase;  $rT_3$ , reverse  $T_3$ ;  $T_3$ , triiodothyronine;  $T_4$ , thyroxine; TBG, thyroxine-binding globulin; TSH, thyrotropin; TTR, transthyretin.

# Hypothyroidism

Disruptions of HYP-ADH-TG axis including mutations

Goitrogens and treatment

## Primary versus secondary

- Cold sensitivity
- Dry cold skin
- Slower movements
- Slow quiet speech
- Bradycardia
- Water retention
  
- **Psychomotoric retardation** (children)
- **Myxedema** (accumulation of protein complexes, polysaccharides, hyaluronic acid and chondroitin sulfuric acid in skin)
- Hypothyroidism since birth = **cretinism**

# Hyperthyroidism

Graves disease, diffusion toxic goiter, toxic nodular goiter, inappropriate pharmacotherapy, excessive iodide intake, thyroiditis, follicular carcinoma, tumors producing TSH

- increased BMR
- Changes in catecholamines reactivity
- **Exophthalmos** - infiltration of lymphocytes and periocular fibroblasts into extraocular muscles and tissue
- unrest
- **Tachycardia**
- Hyperventilation

# Hypo- versus hyperthyroidismus

Parameter	Hypothyroidism	Hyperthyroidism
BMR	(-)	(+)
Carbohydrate metabolism	Gluconeogenesis (-) Glycogenolysis (-) Glycemia (N)	Gluconeogenesis (+) Glycogenolysis (+) Glycemia (N)
Protein metabolism	Proteosynthesis (-) Proteolysis (-)	Proteosynthesis (+) Proteolysis (+) Muscle mass (-)
Lipid metabolism	Lipogenesis (-) Lipolysis (-) Serum cholesterol (+)	Lipogenesis (+) Lipolysis (+) Serum cholesterol (-)
Thermogenesis	(-)	(+)
Autonomic nervous system	Plasmatic catecholamines (N)	Increased reactivity – $\beta$ -AR (+) Plasmatic catecholamines (-)
