# Pathophysiological principles of respiratory insufficiency, oxygen therapy and mechanical ventilation

MUDr. MSc. Michal Šitina, PhD.

Department of pathological physiology, MUNI
Department of anaesthesia and intensive care medicine, FNUSA
Biostatistics, ICRC-FNUSA

MUNI
MED

# Contents

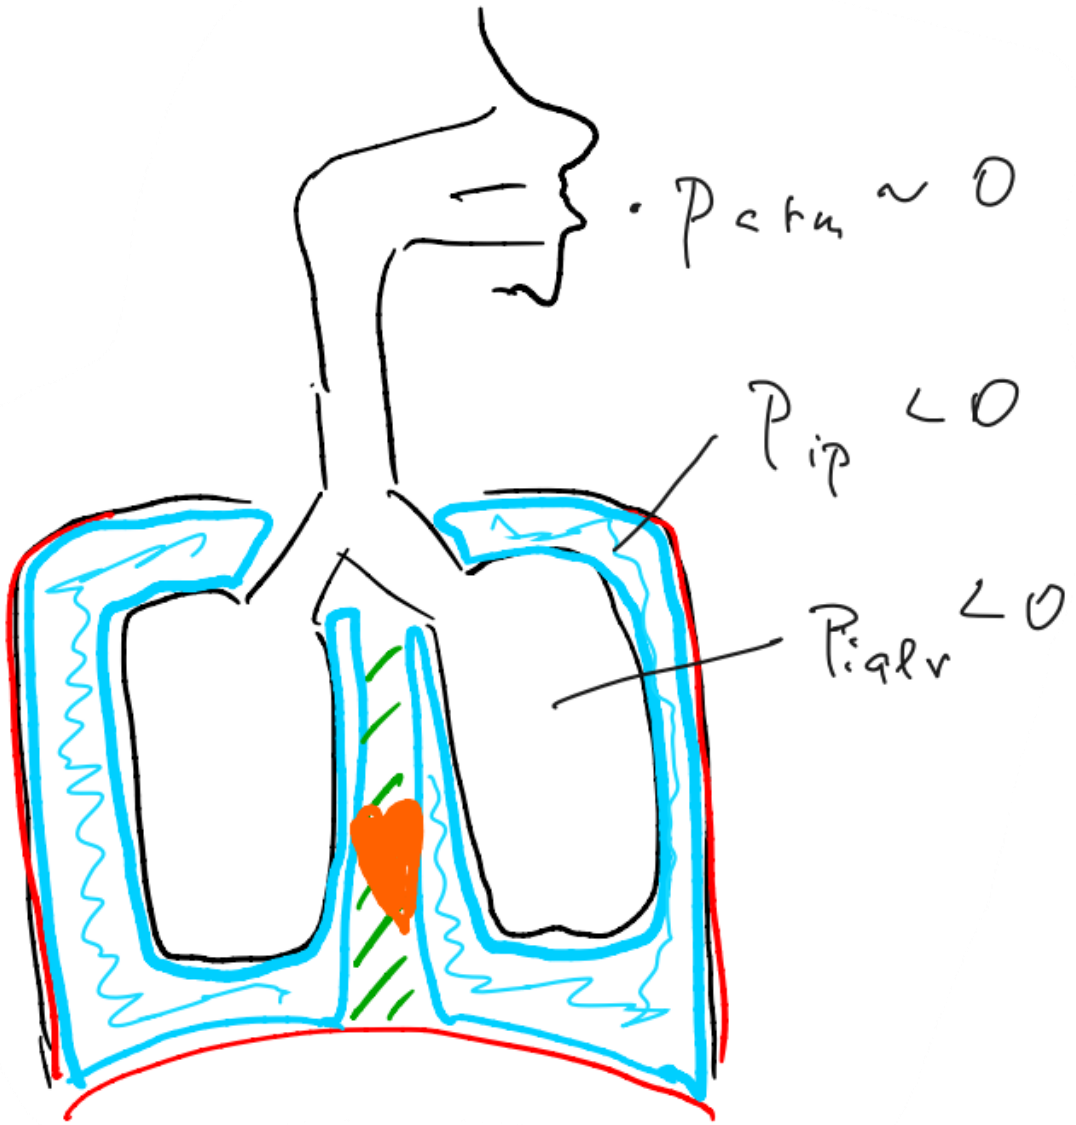
1. Basics of respiratory (patho)physiology
2. Principles of mechanical ventilation
3. Applied pathophysiology of MV in clinical cases
4. *Exact analysis of mechanisms of respiratory insufficiency*

# Mechanisms of respiratory insufficiency

MUNI
MED

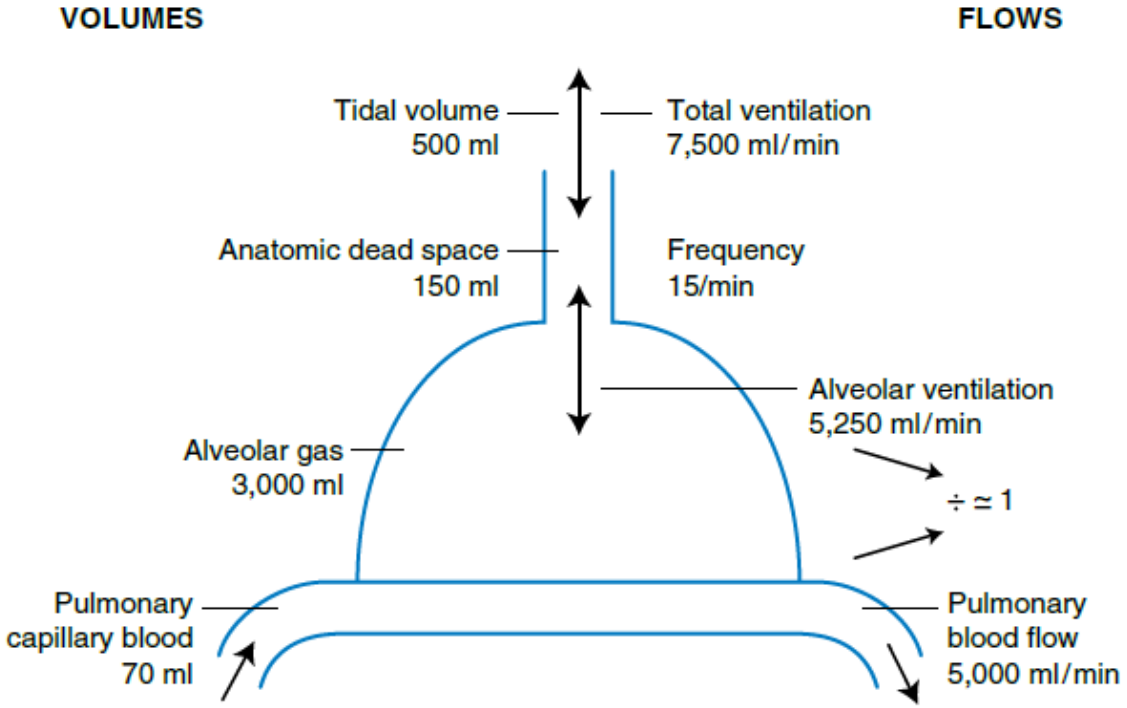
## Mechanics of spontaneous breathing

- pressure in area of lips approx. 0
- active inspiration
  - diaphragm, intercostal muscles
  - negative intrapleural pressure
- spontaneous expiration
  - positive intrapleural pressure



MUNI
MED

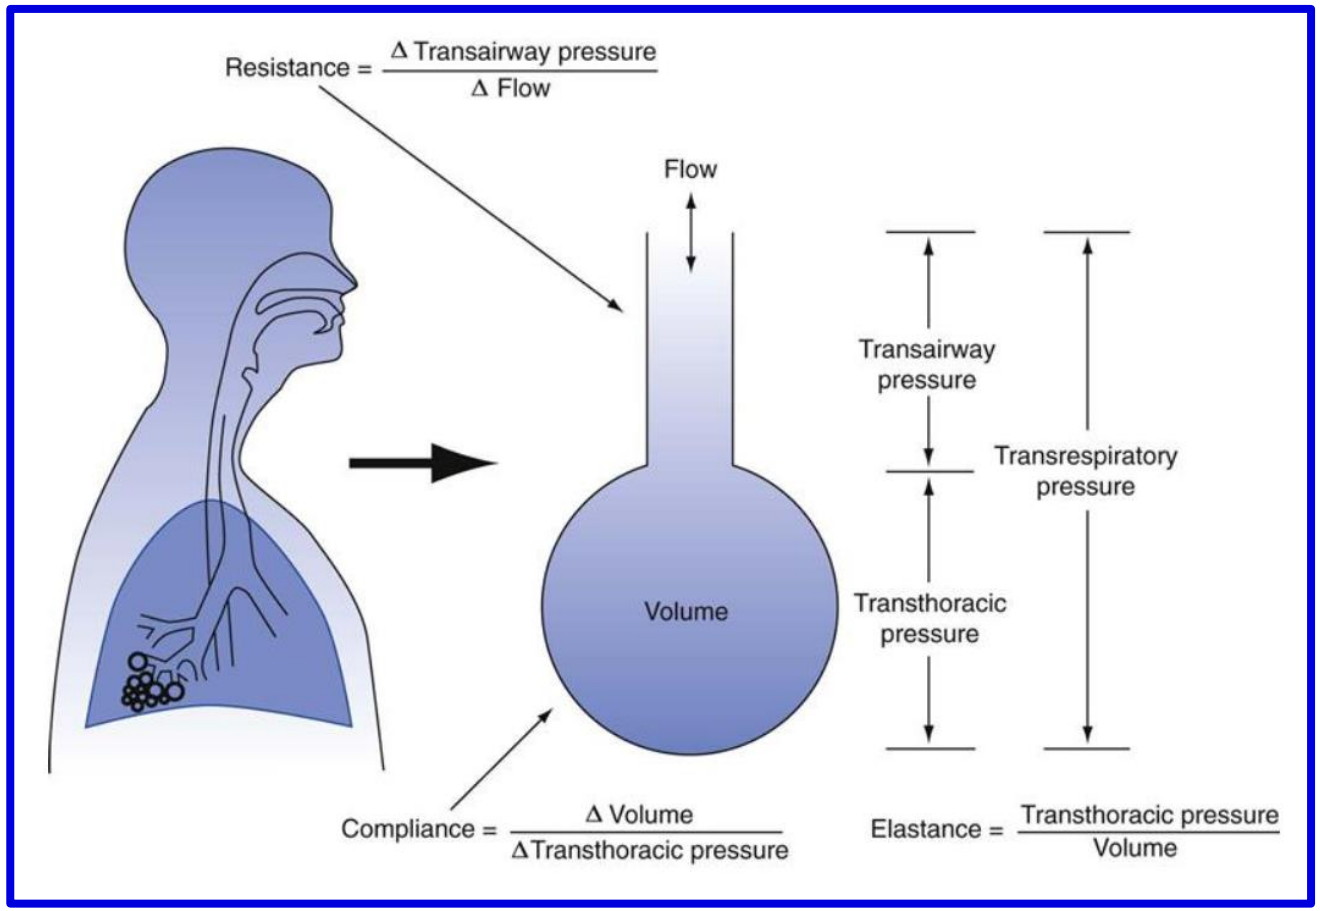
# Important quantities and terms

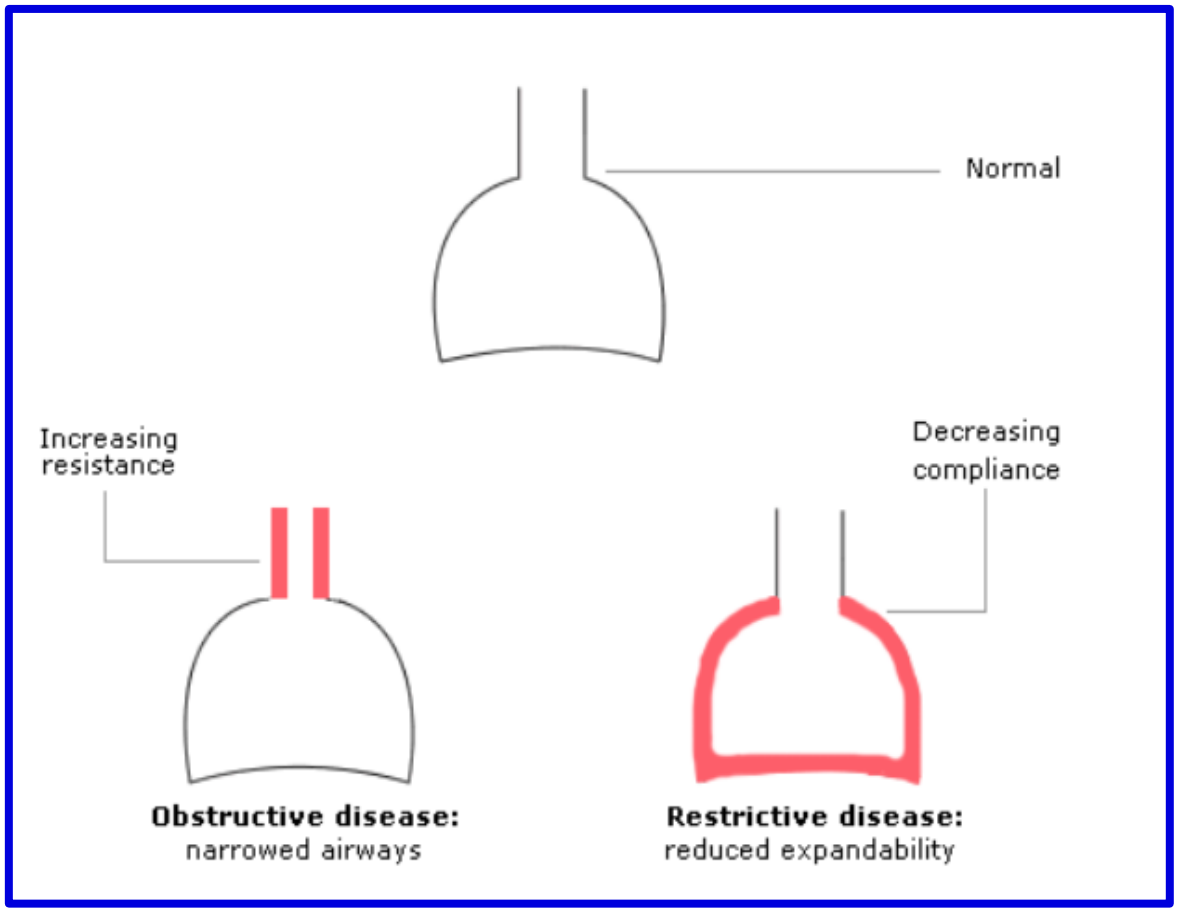


- $FiO_2$ (21 %)
- $PaO_2$ (> 80 mmHg, hypoxemia vs. hypoxia)
- $PaCO_2$ (35-45 mmHg, hypo/normo/hypercapnia)
- tidal volume (≈500 ml)
- respiratory rate (≈ 12-16/min)
- anatomic dead space (150 ml)

# Physical principles

- pressure vs. pressure difference
- compliance
- resistance





MUNI
MED

## Respiratory insufficiency

- type 1 – oxygenation dysfunction - hypoxemia without hypercapnia
- type 2 – ventilation dysfunction – hypercapnia with hypoxemia

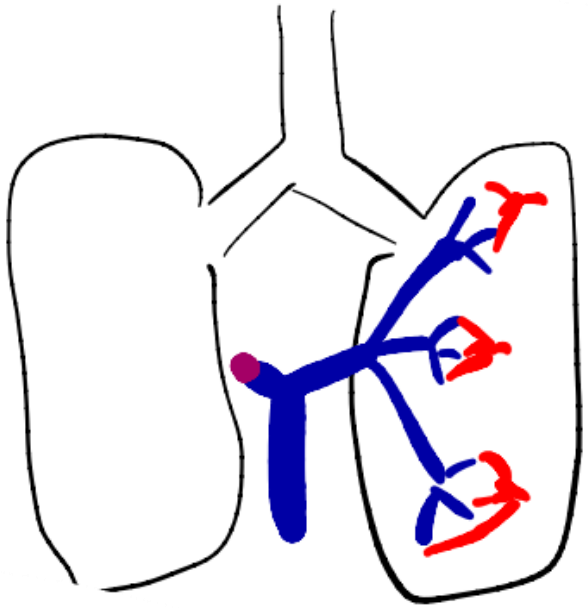
## Mechanisms of respiratory insufficiency

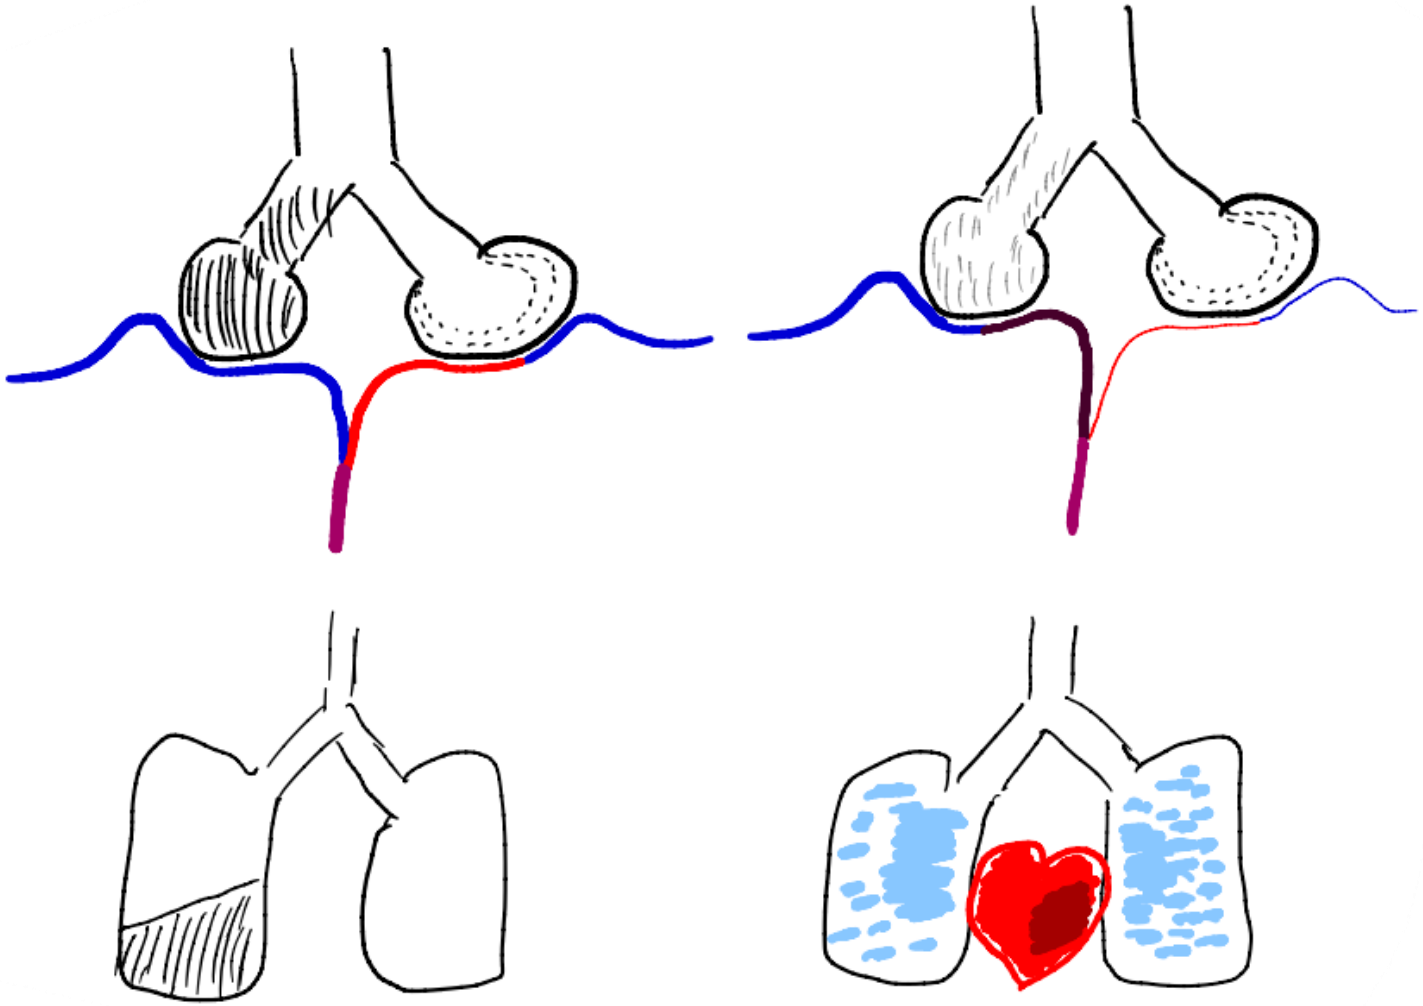
- global hypoventilation
- impaired diffusion across alveolocapillary membrane
- dead space
- intrapulmonary (or extrapulmonary) shunt
- ventilation-perfusion (V/Q) mismatch

MUNI MED

# Mechanisms of respiratory insufficiency

- hypoventilation, diffusion, dead space, shunt, V/Q mismatch

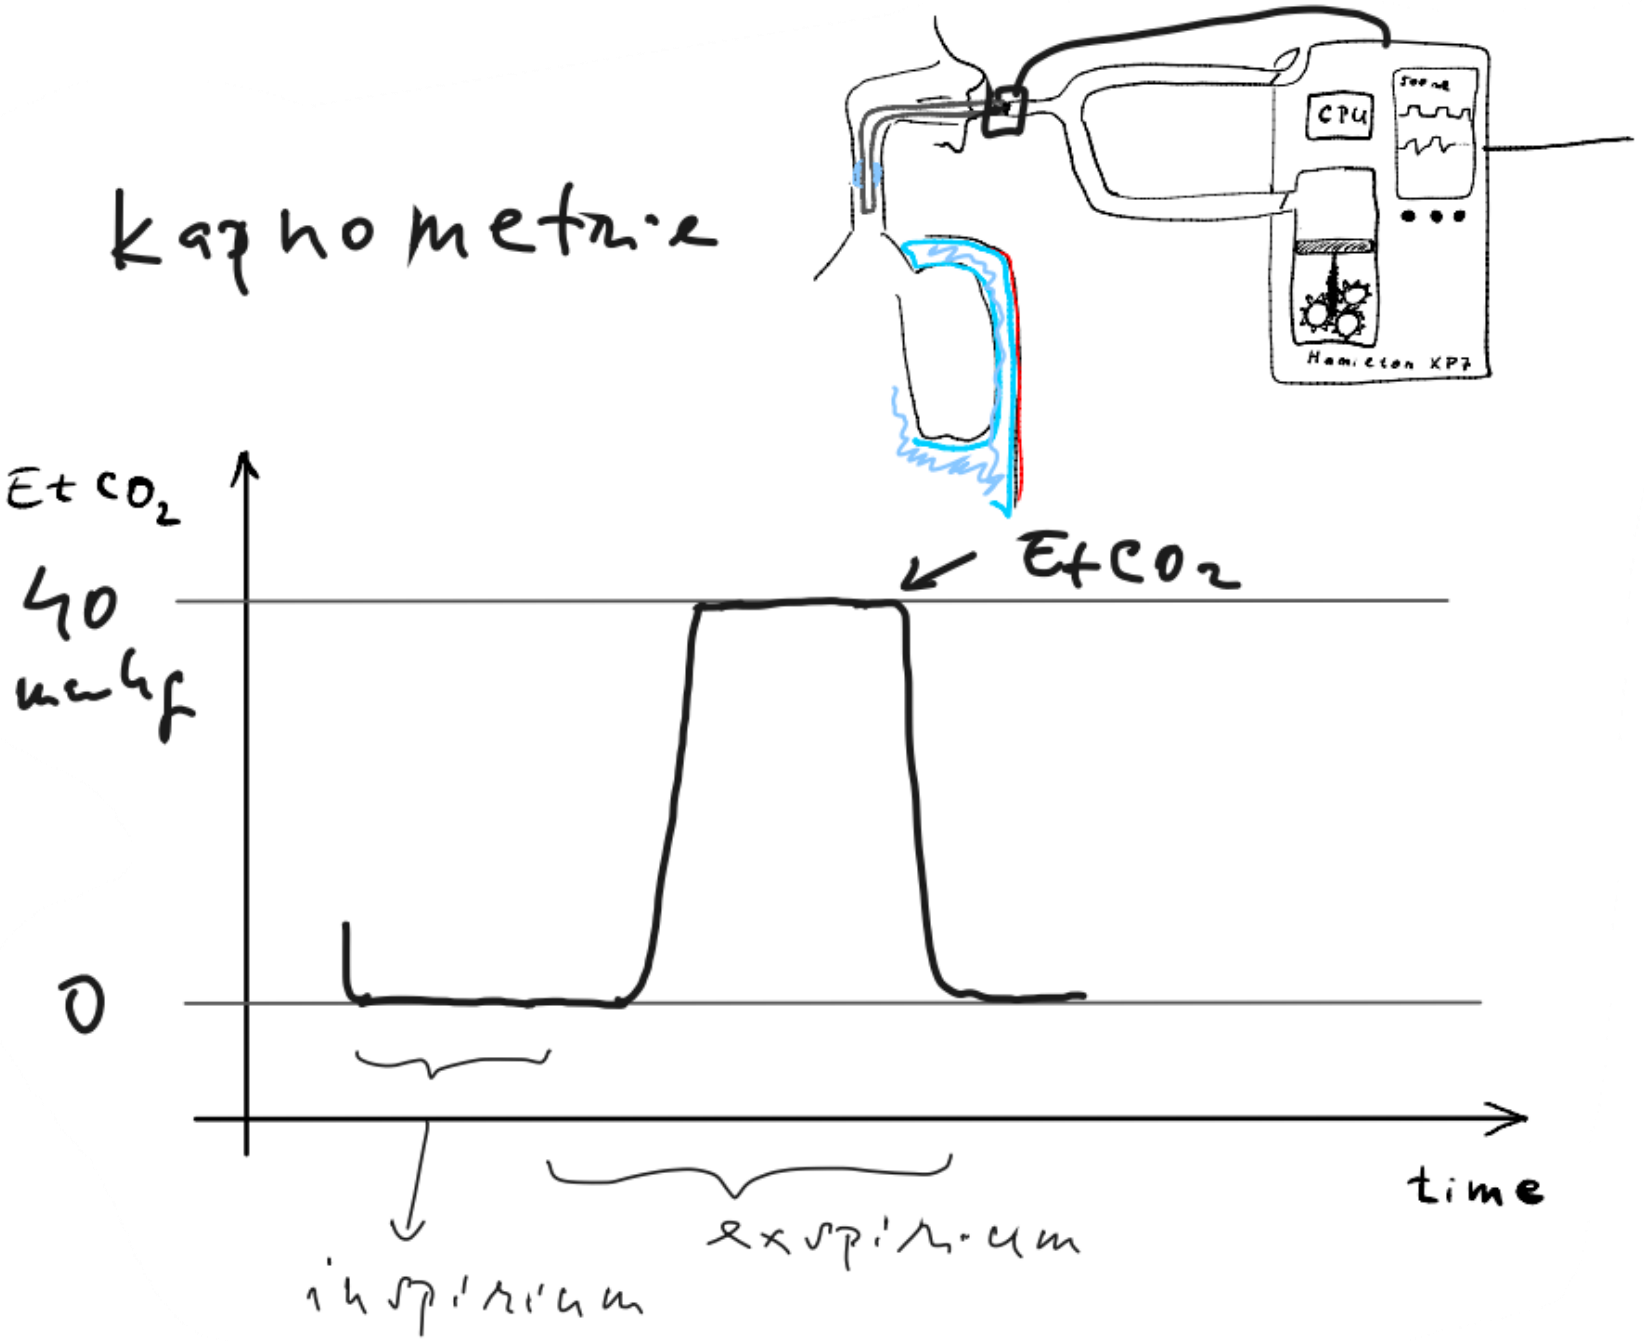




MUNI
MED

# Capnometry

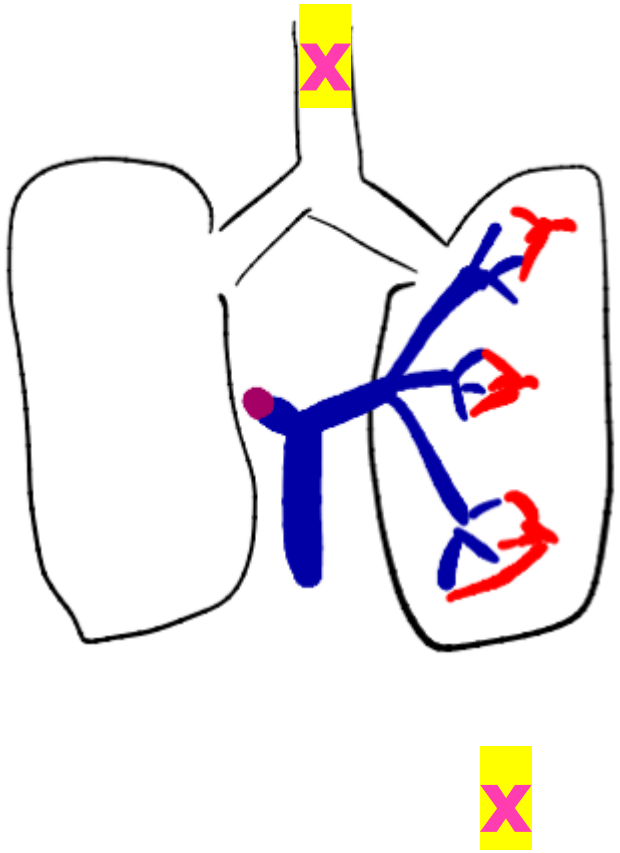
- monitoring of breathing
- 100 % verification of correct tracheal intubation

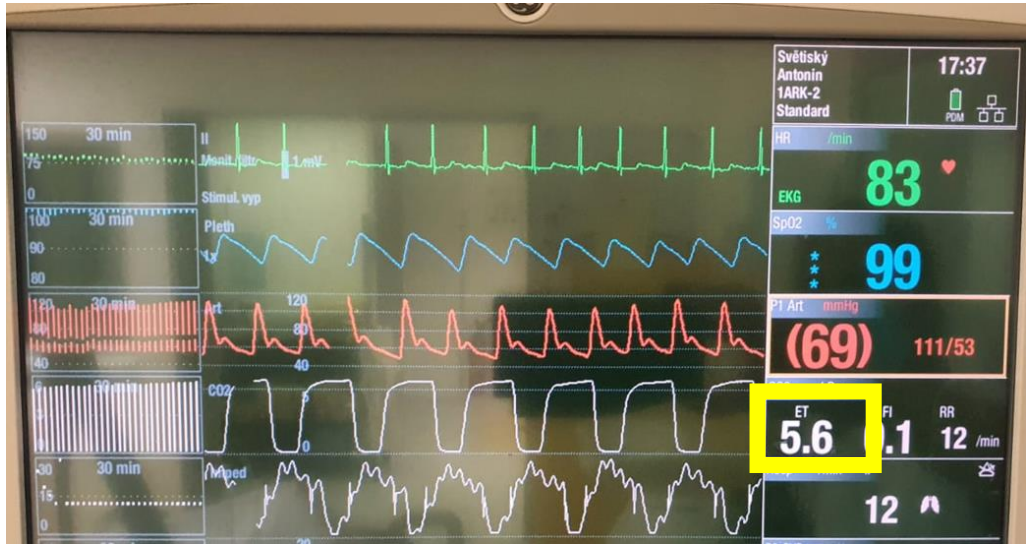


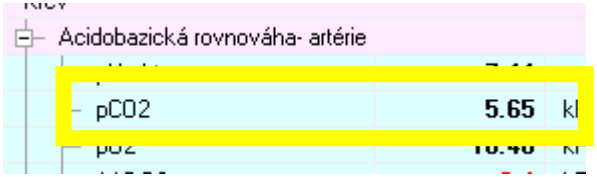
MUNI MED

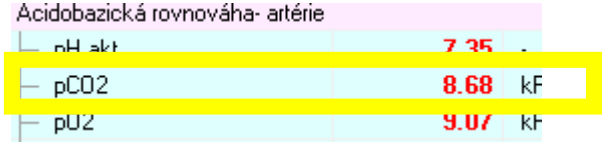
# $PaCO_2$ x $EtCO_2$ = $CO_2$-gap

- increased with pulmonary pathology









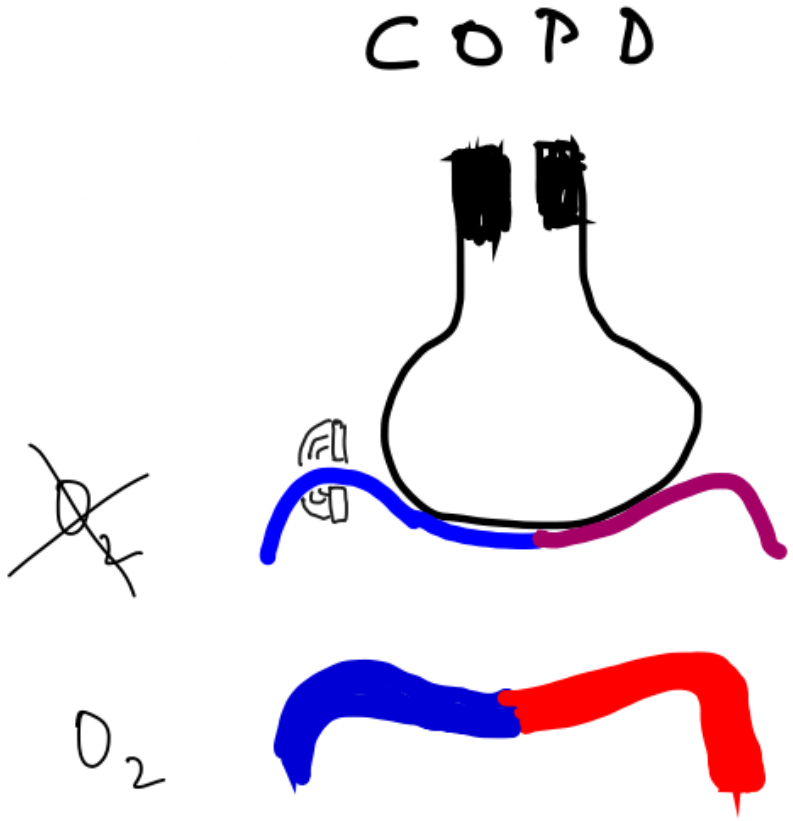
MUNI
MED

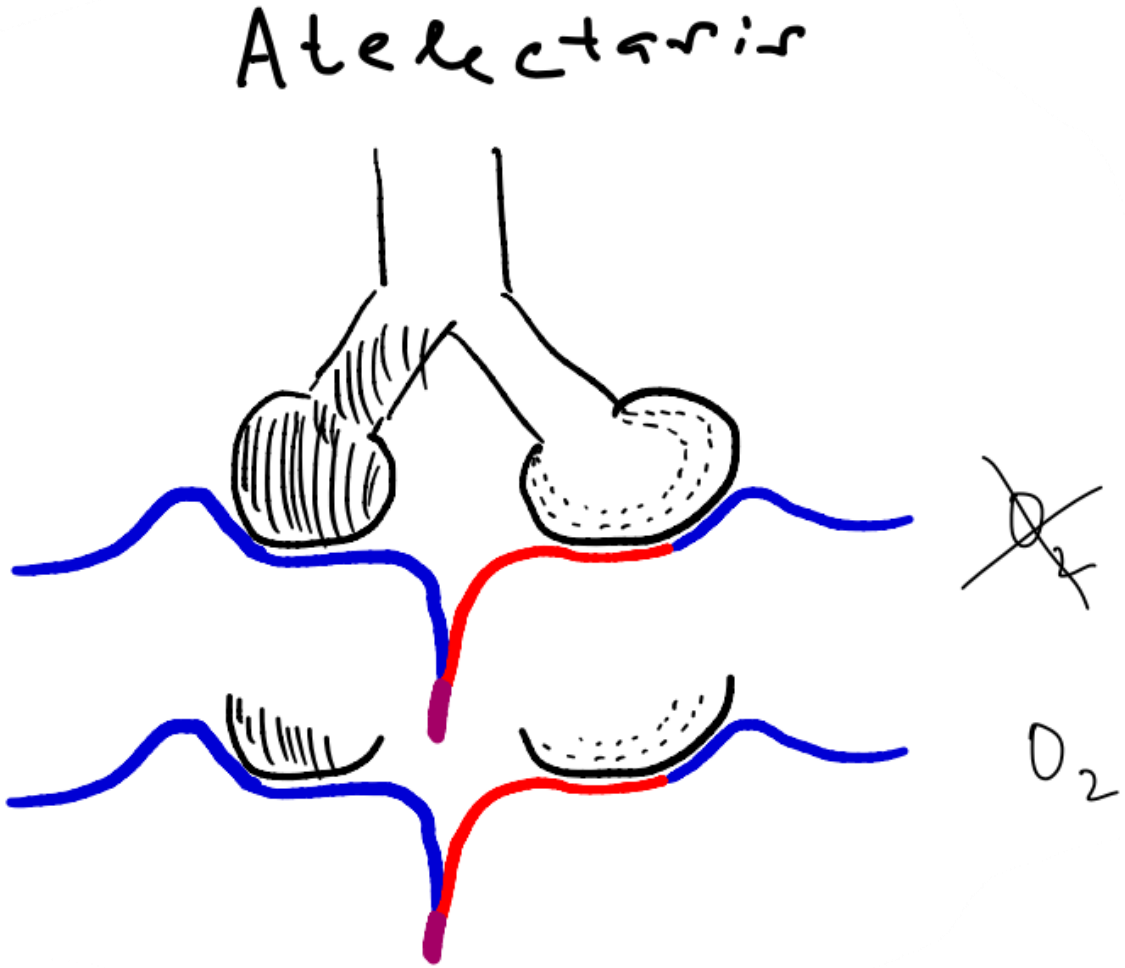
## Oxygen therapy

- oxygen delivery
- principle: increased $FiO_2$
- corrects hypoxemia
- no correction or impairment of hypercapnia
- sometimes almost no effect

# Oxygen therapy

- Why impairment of hypercapnia?
- Why sometimes almost no effect?





# Principles of mechanical ventilation

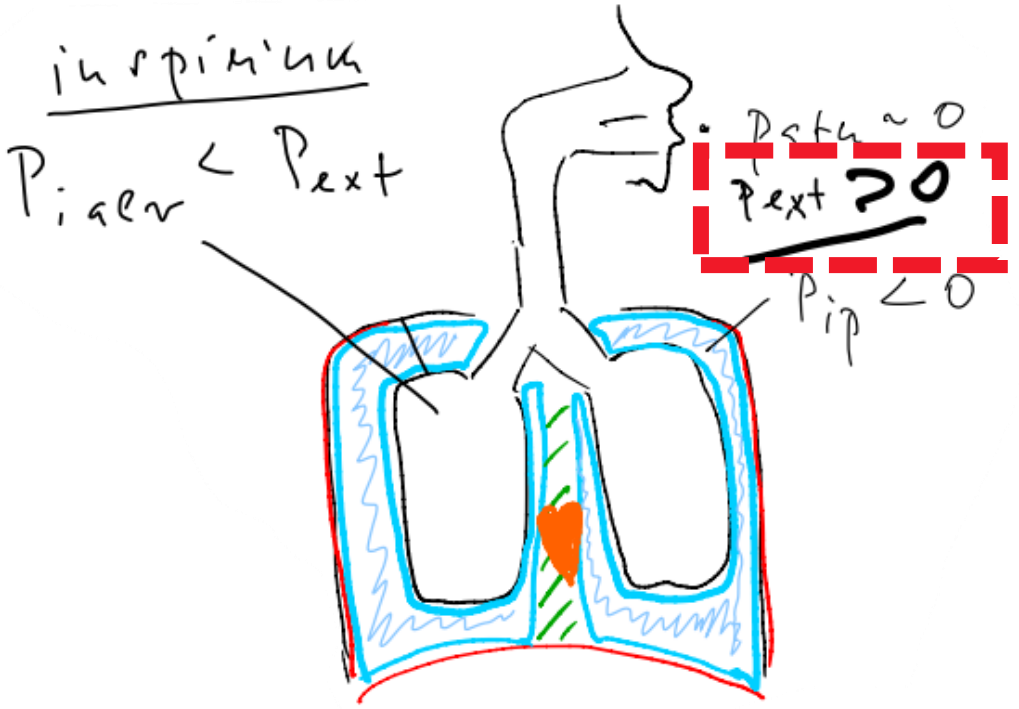
MUNI MED

# Mechanical ventilation

- ventilation using ventilator replacing a part or a whole work of breathing of a patient
- therapeutic goals
  - correction of hypoxemia
  - correction of hypercapnia
  - decrease in work of breathing
  - hemodynamic stabilisation
  - airways protection
  - performance of an operation
  - …

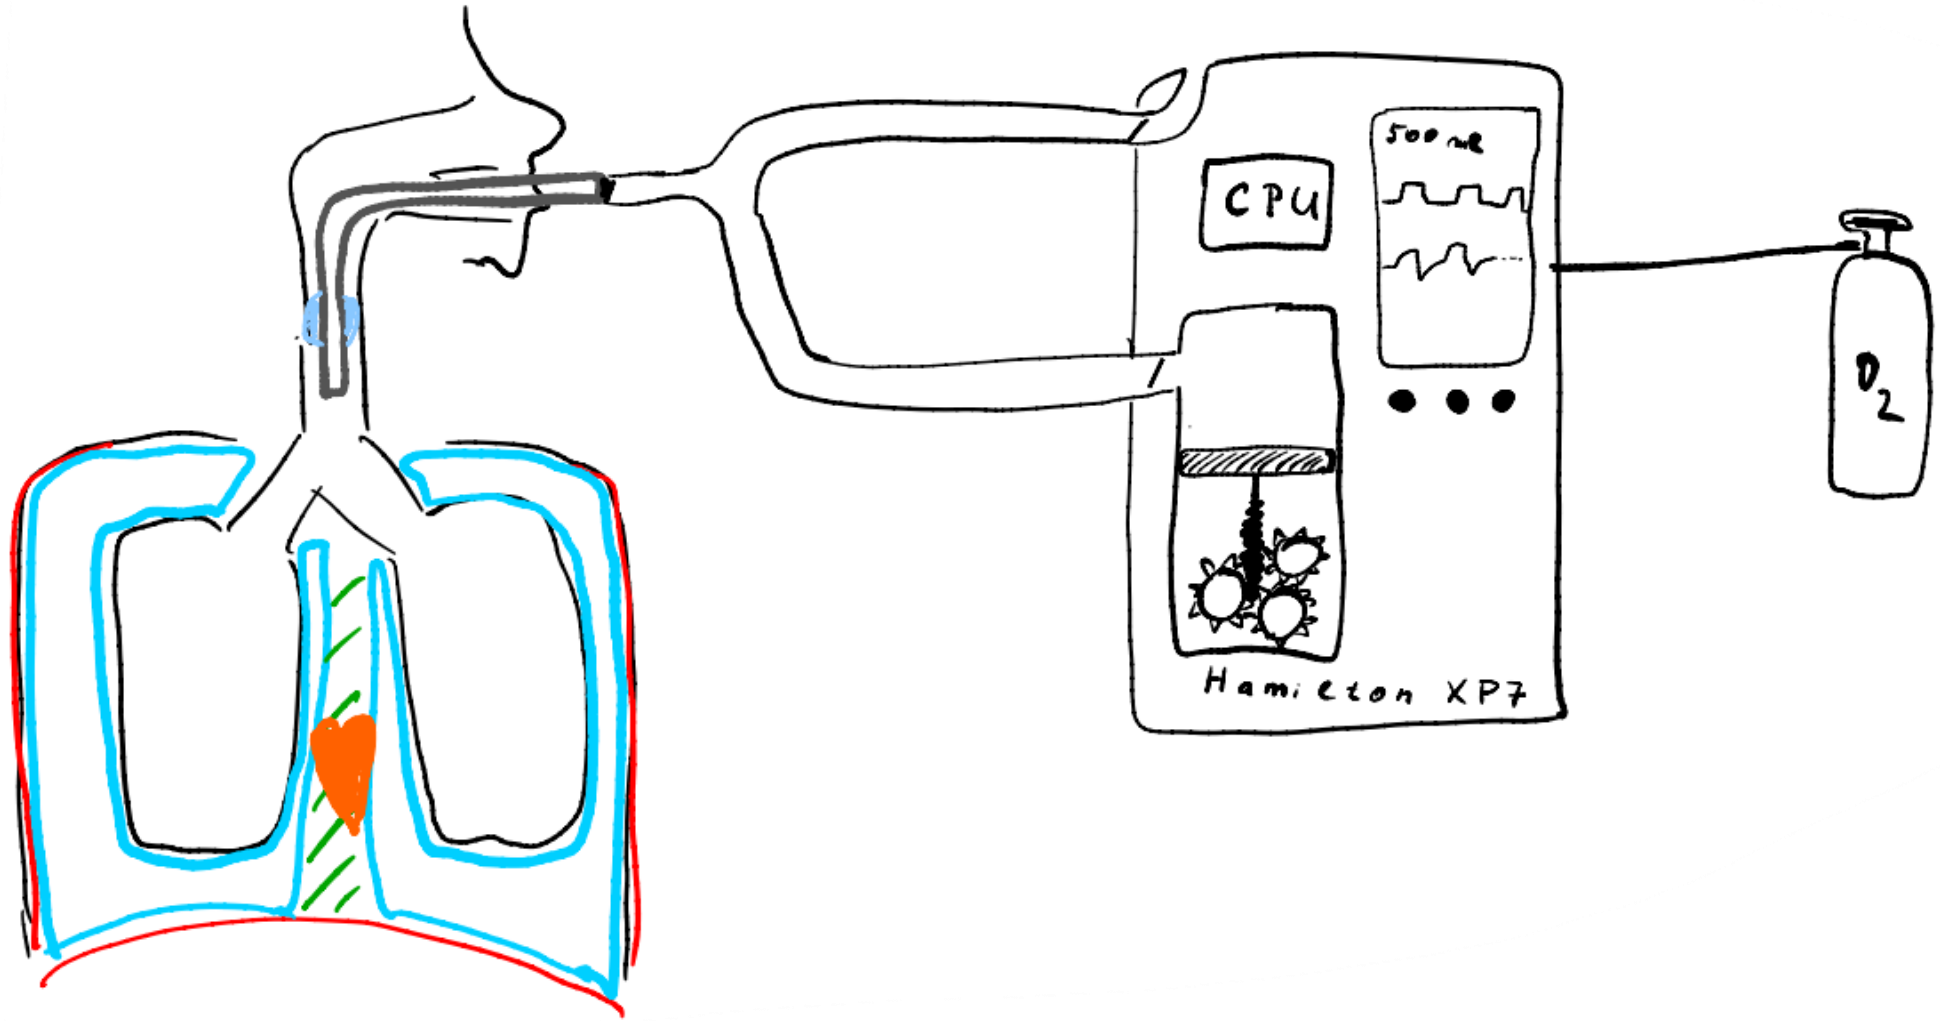
MUNI
MED

# Principle of mechanical ventilation

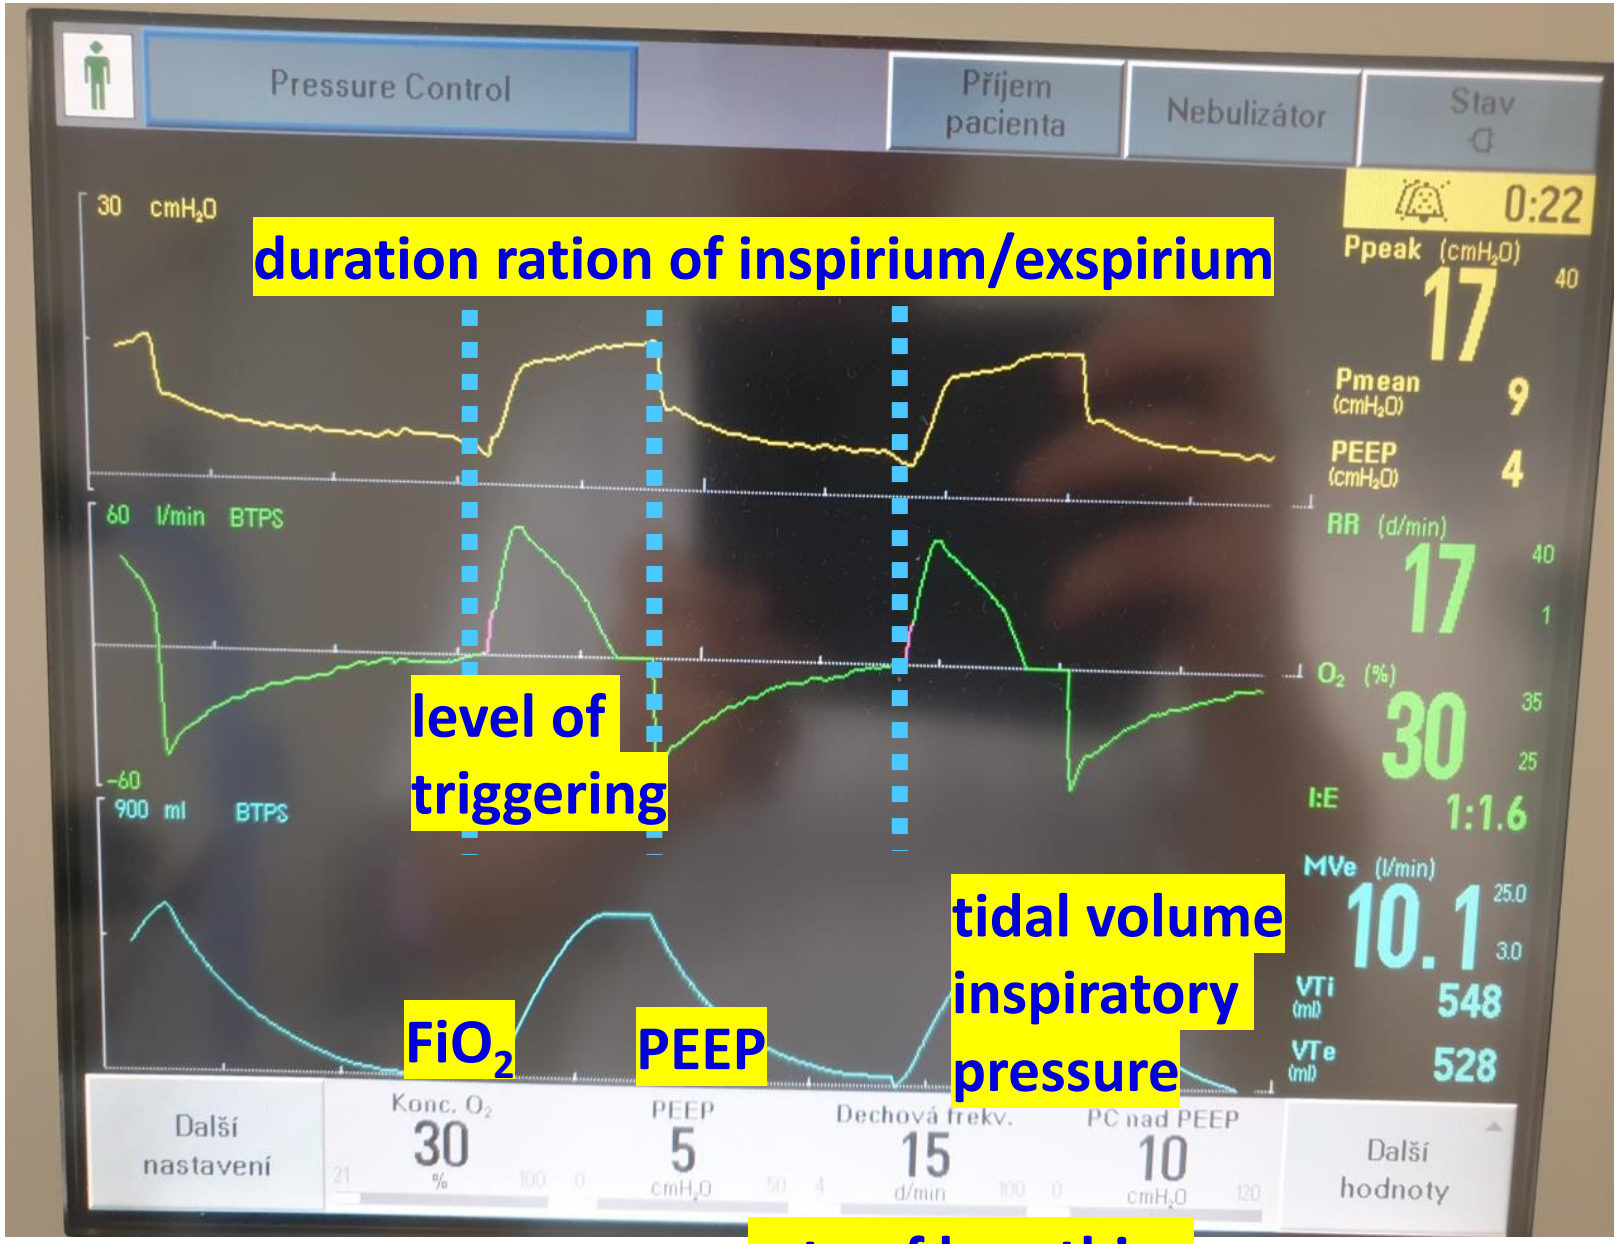


- active inspiration
  - **positive pressure in airways created by ventilator**
- passive expiration
  - just as in spontaneous breathing

# Principle of mechanical ventilation



# What can we set on the ventilator?



# What do we monitor?

MUNI MED

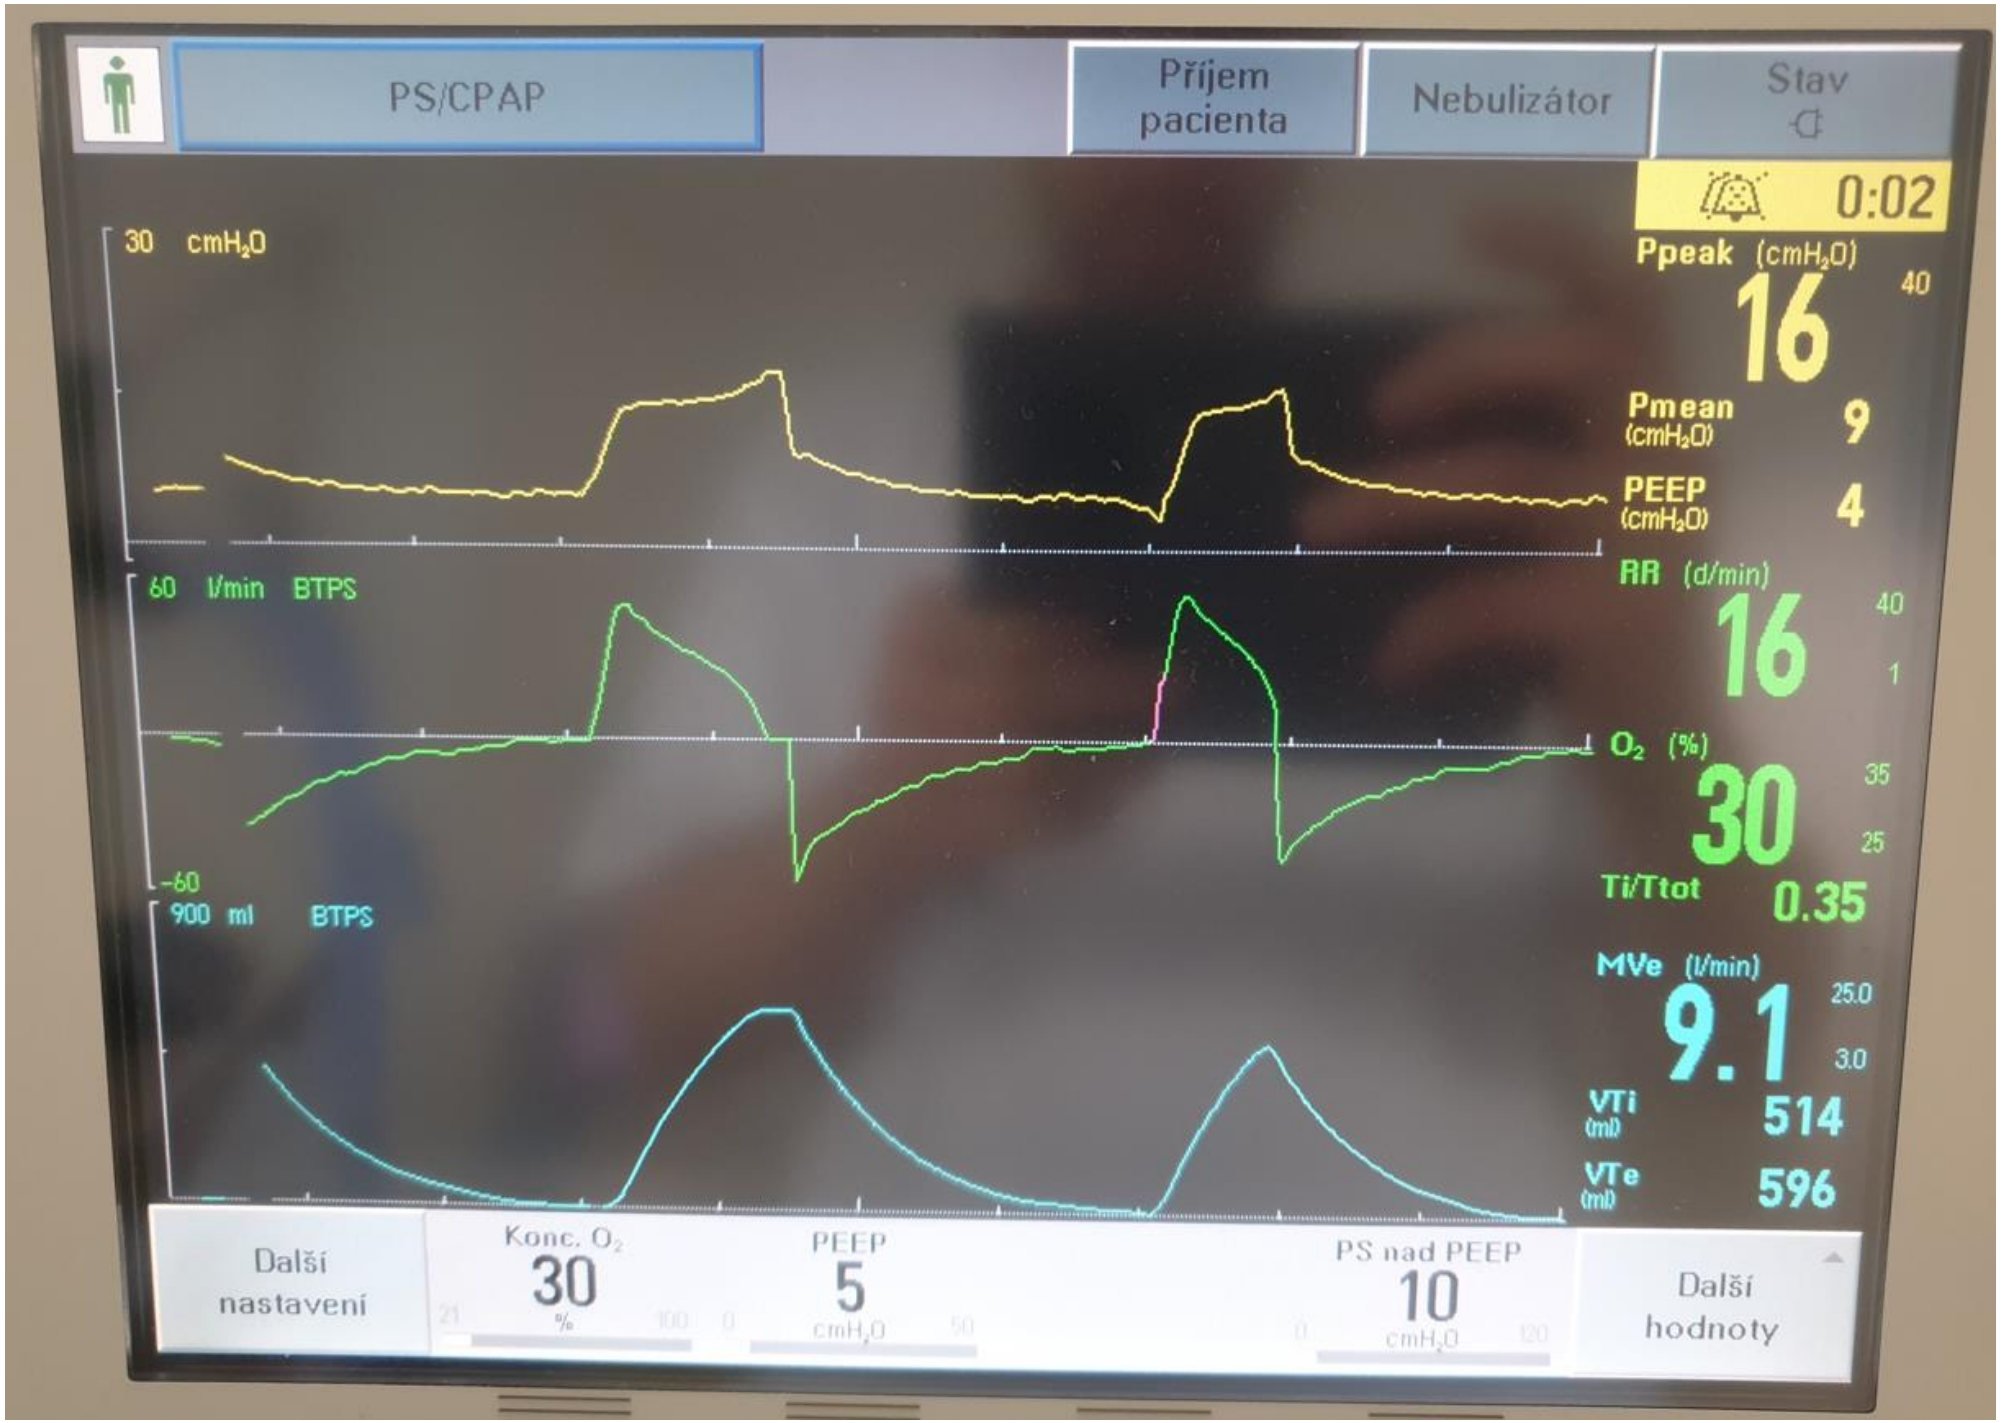
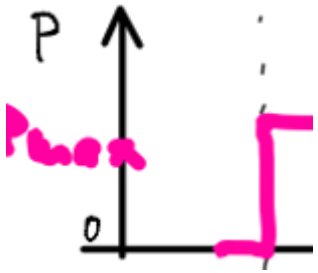
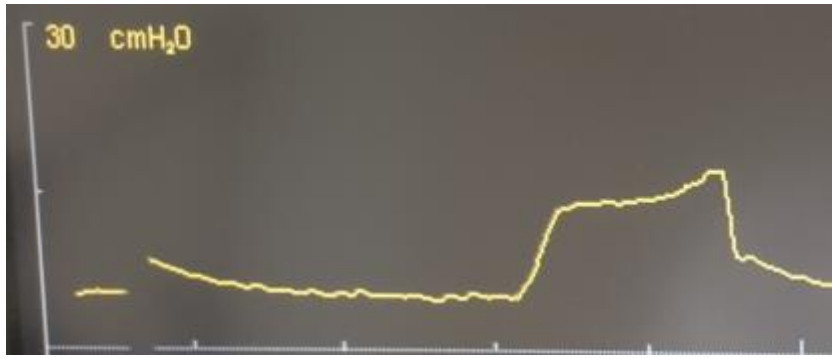
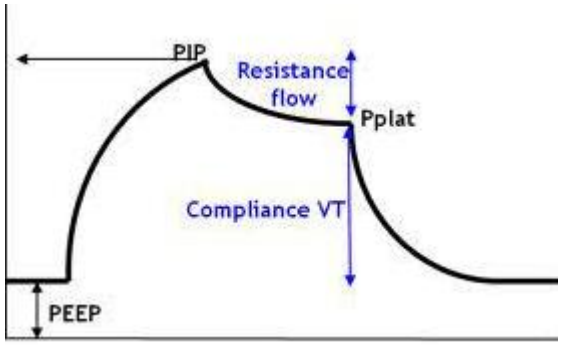
# PCV versus PSV



MUNI MED







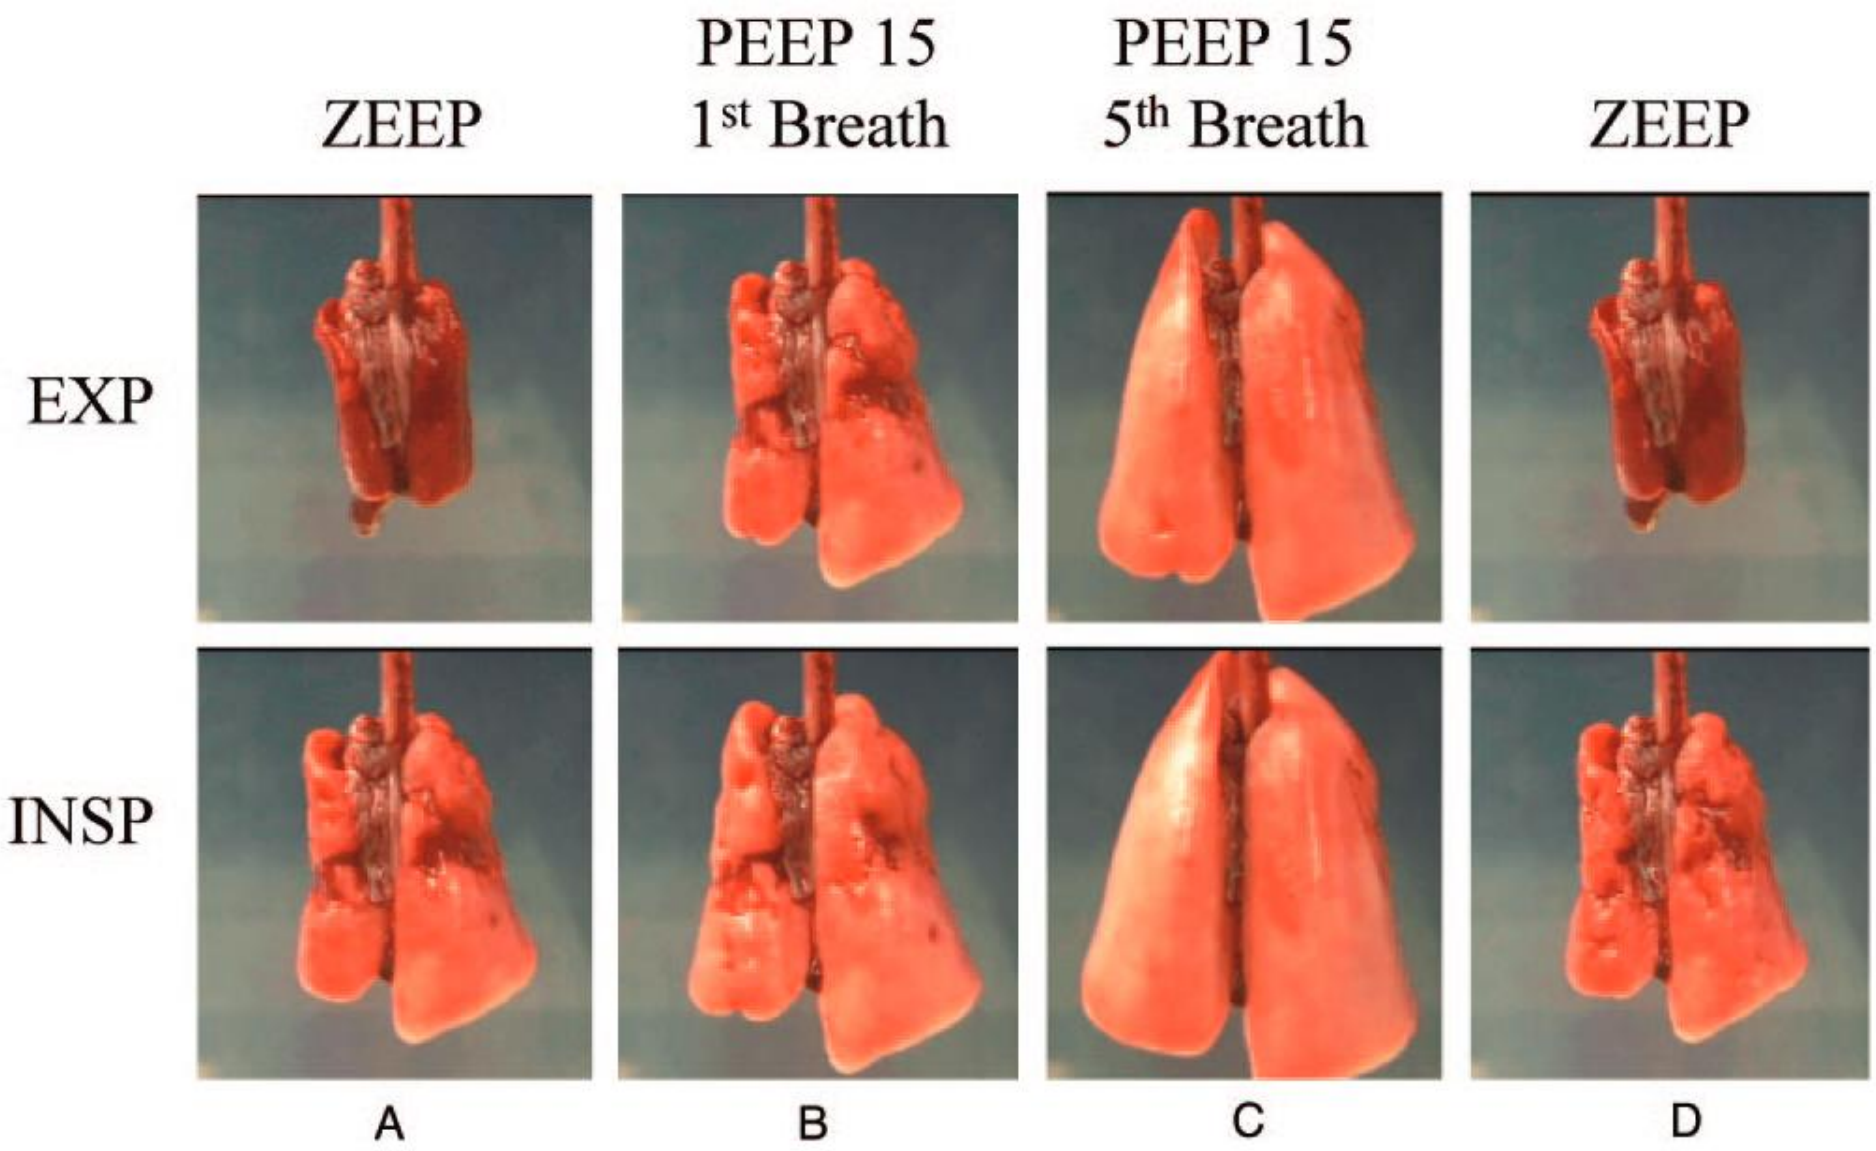
# PEEP (positive end-expiratory pressure)

- the lowest pressure in airways
- prevents alveolar collapse (called atelectasis)

- both too low and too high values are harmful
  - ➢ it is necessary to find the optimal value

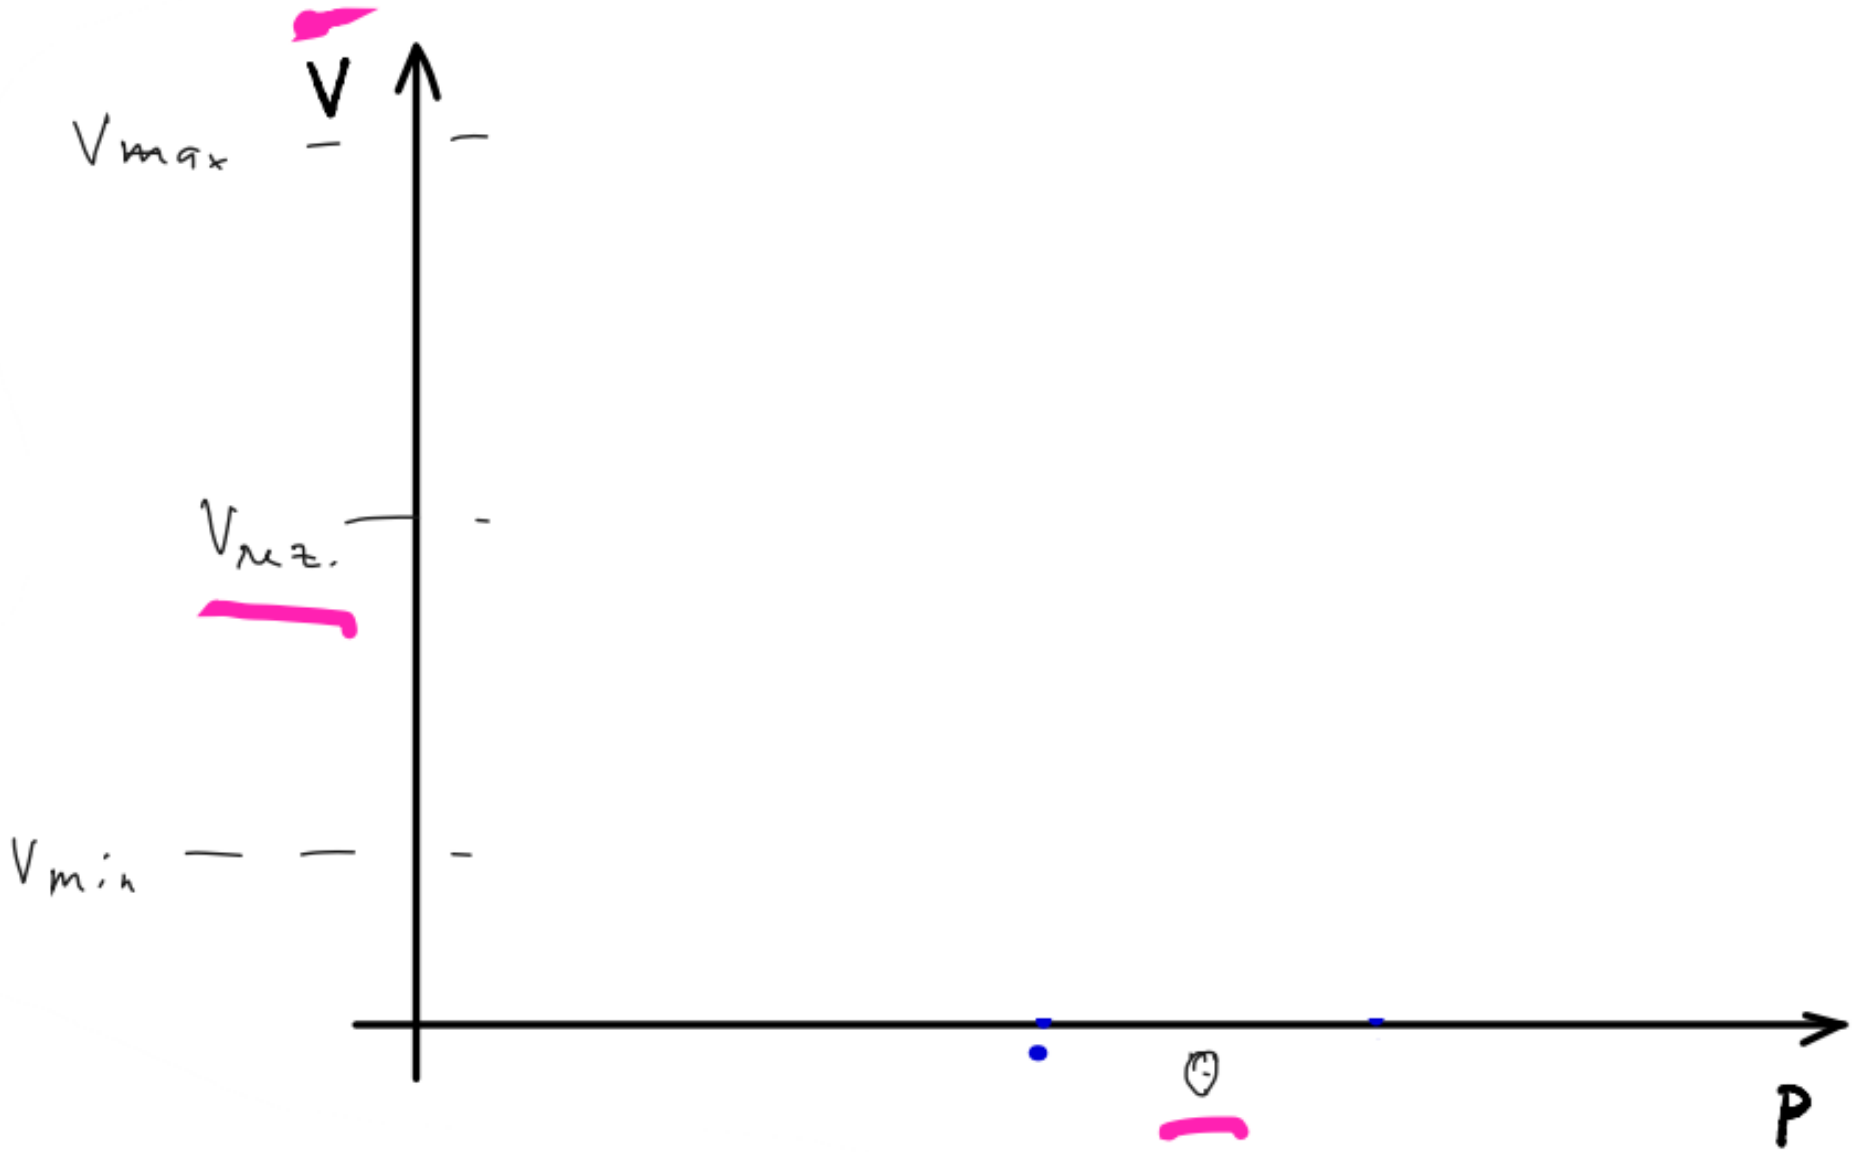
MUNI MED

# Influence of PEEP on lung aeration

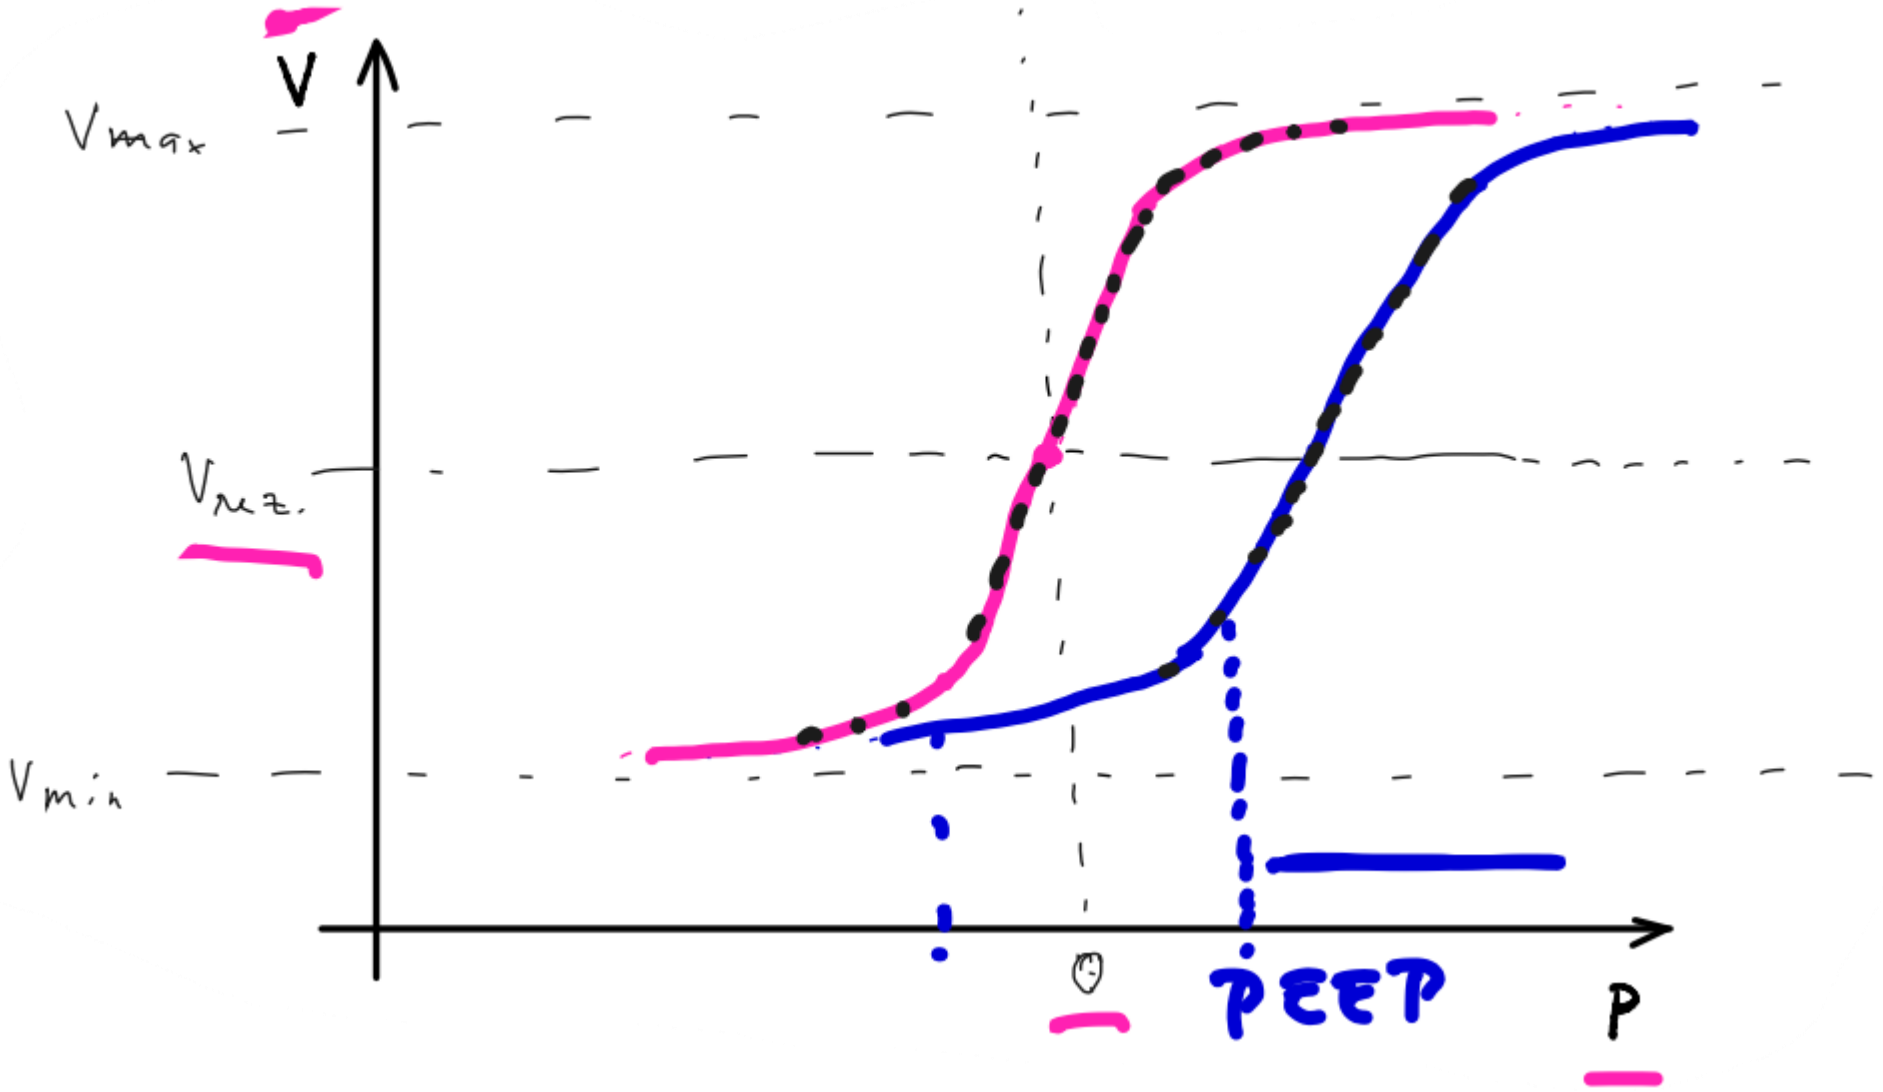


RESPIRATORY CARE • MAY 2005 VOL 50 NO 5

# p-V curve and PEEP



# p-V curve and PEEP



MUNI MED

# Effects of MV on other systems

## Effects on cardiovascular system

- decreases venous return and subsequently the cardiac output
- affects pulmonary hypertension and so the right ventricle function
- can help the failing left ventricle
- decreases oxygen consumption in respiratory muscles

## Effects on other systems

- significant influence on acid-base balance ($CO_2$)
- decreases renal blood flow and so promotes fluid retention
- increases intraabdominal pressure and reduces splanchnic perfusion
- can increase intracranial pressure
- „motor“ of multiorgan failure

MUNI
MED

# Ventilator induced lung injury (VILI)

!!! inappropriate ventilation can damage lungs

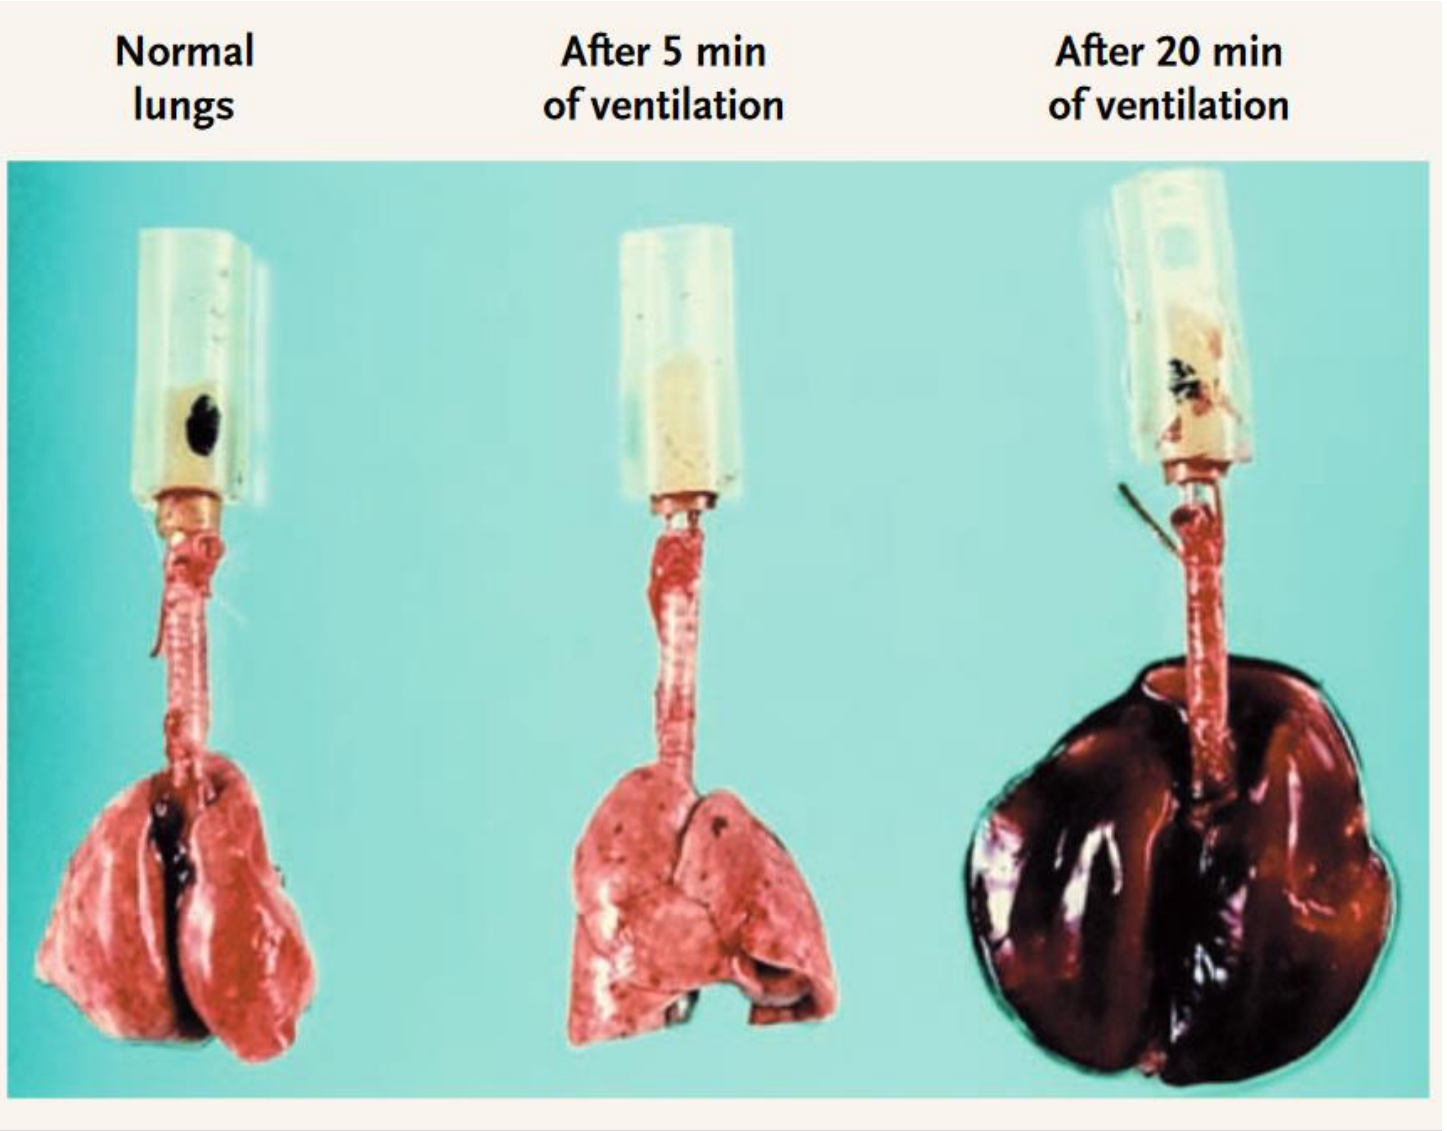


Figure 1. Normal Rat Lungs and Rat Lungs after Receiving High-Pressure Mechanical Ventilation at a Peak Airway Pressure of 45 cm of Water.

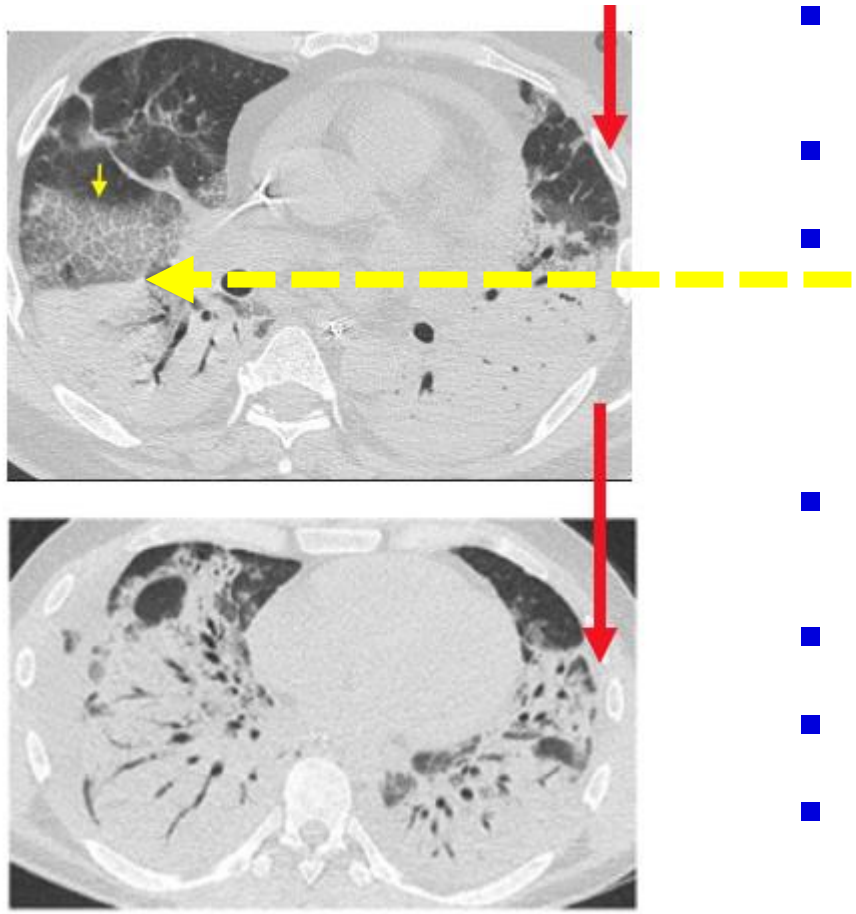
6. Webb HH, Tierney DF: **Experimental pulmonary edema due to intermittent positive pressure ventilation with high inflation pressures. Protection by positive end-expiratory pressure.** *Am Rev Respir Dis* 1974, **110:** 556–565.

MUNI
MED

# How can MV damage lungs?



- large distension tears pulmonary structures
  - econdary inflammatory reaction and fibrosis
- danger of lung perforation in thin areas -> pneumothorax
- shear forces on the boundary of ventilated and non-ventilated areas of lungs

- elimination of natural immune barriers
  - ventilator-associated pneumonia
- risks of intubation and airway management
- promotion of muscle weakness of critically ill patients
- necessary sedation

MUNI
MED

# Non-invasive ventilation

- just as mechanical ventilation, but
  - patient is not (deeply) sedated
  - airways are not secured
- impossible to use high PEEP or inflation pressures
- short-term or repeated usage
- typical indications
  - acute COPD exacerbation
  - moderate cardiogenic pulmonary edema
  - intermittent support after extubation

# PSV at NIV

MUNI
MED

# Administration of prostacyclin

- prostacyclin causes dilatation of pulmonary arterioles and thus reduces pulmonary hypertension
- can be inhaled or administered intravenously
- in patients with respiratory insufficiency, just one of both routes of administration improves respiratory insufficiency

**which one and why?**

MUNI
MED

# Applied pathophysiology of MV in clinical cases

MUNI

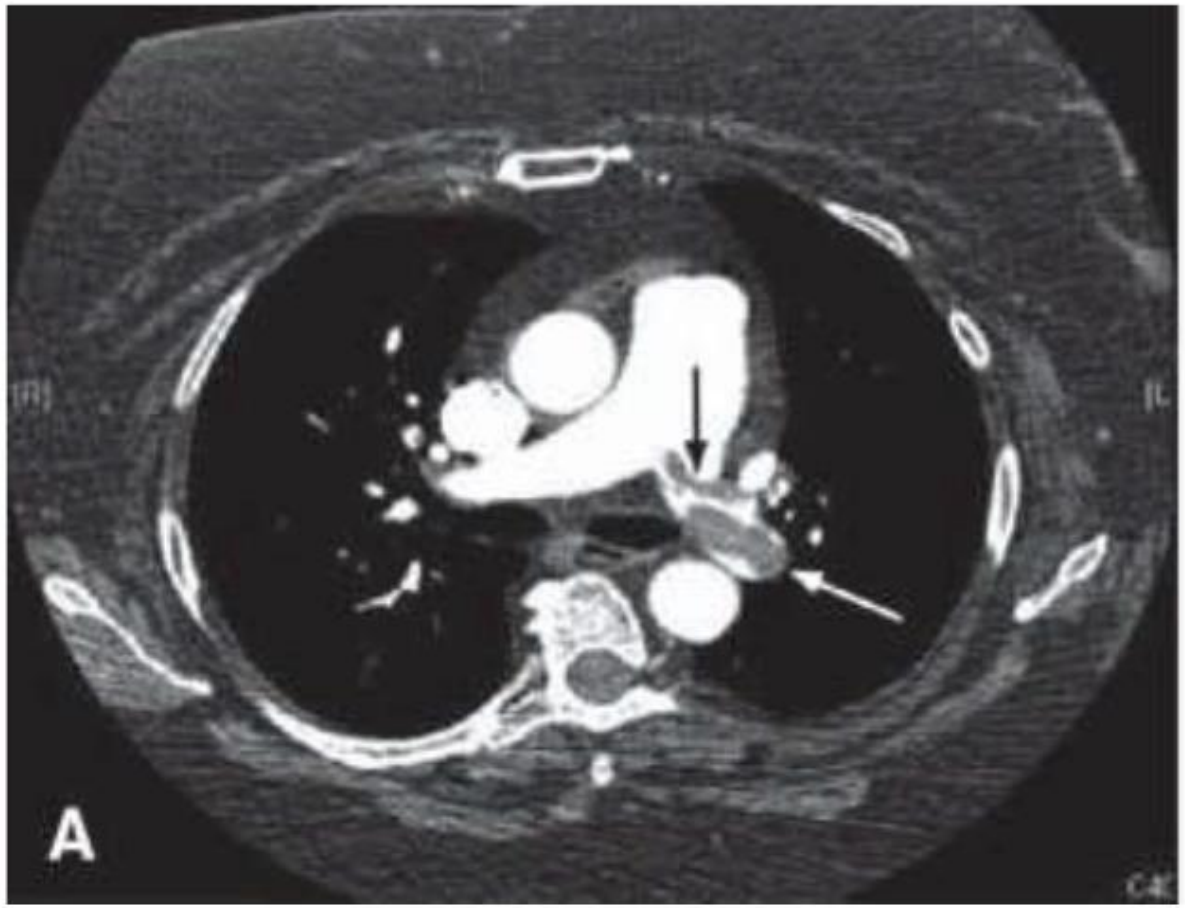
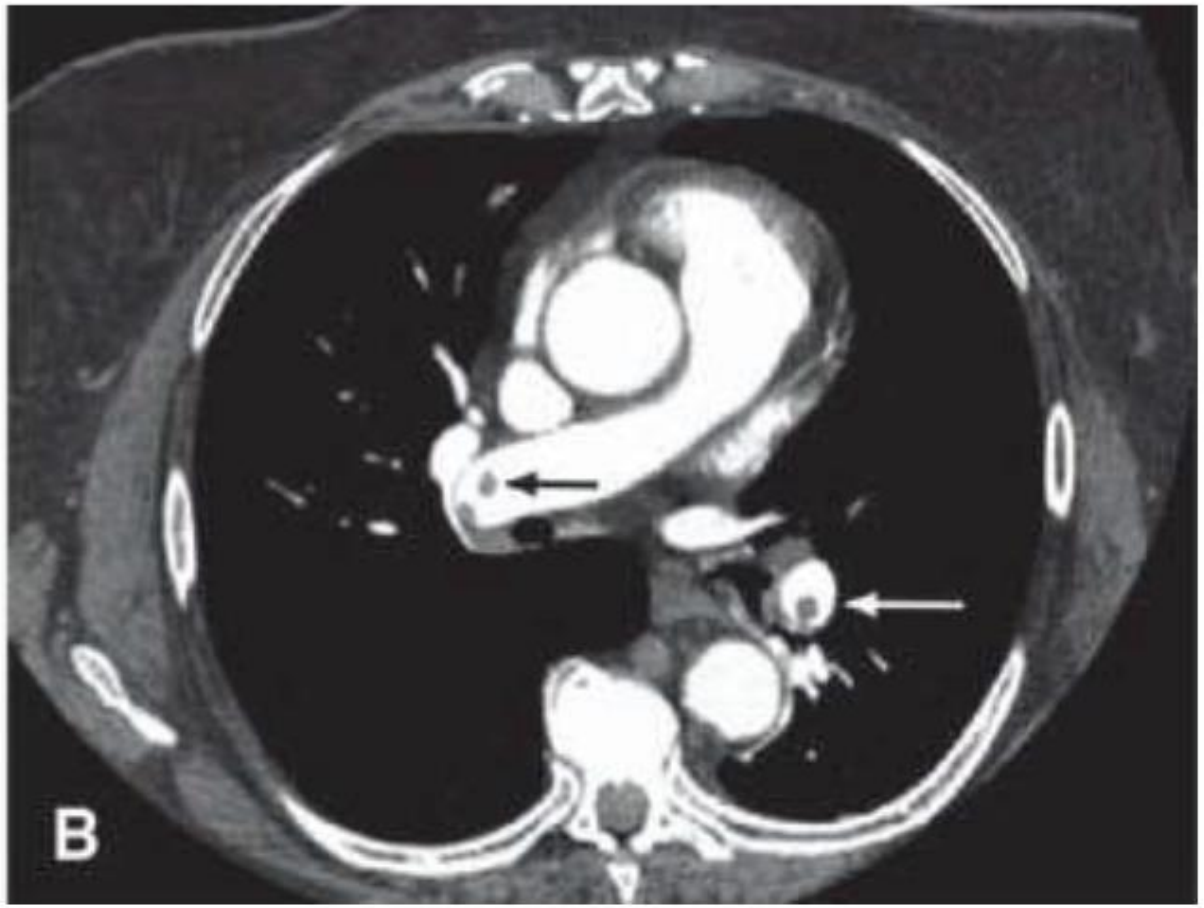
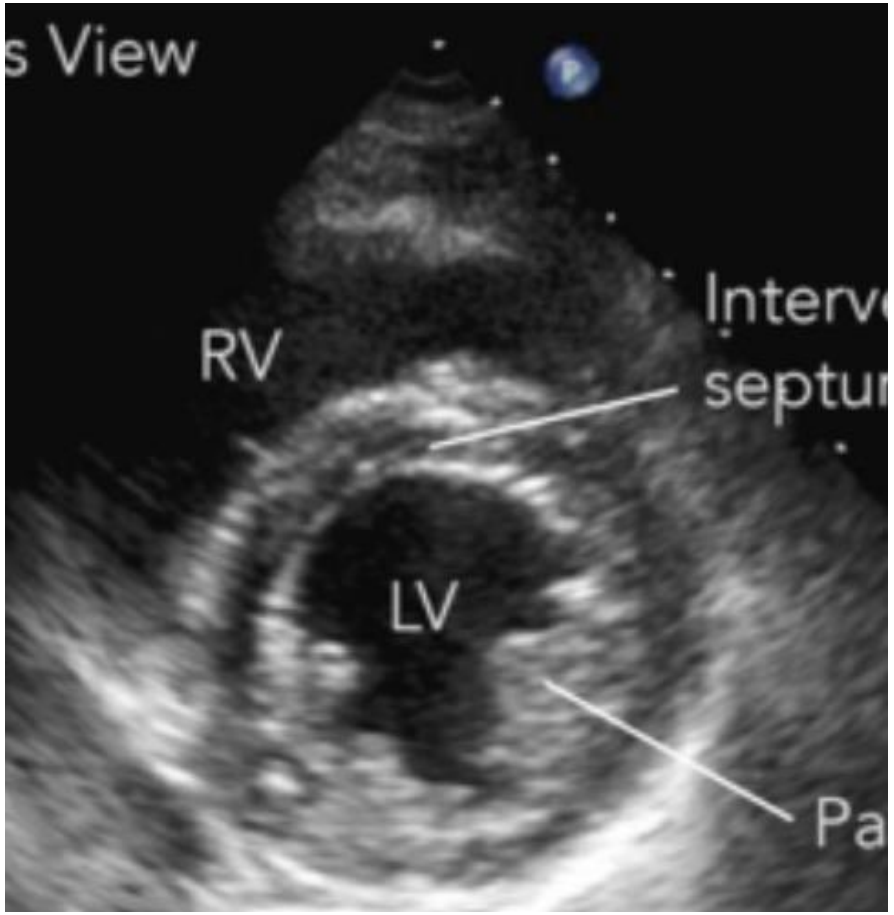
# Pulmonary embolism – angio CT

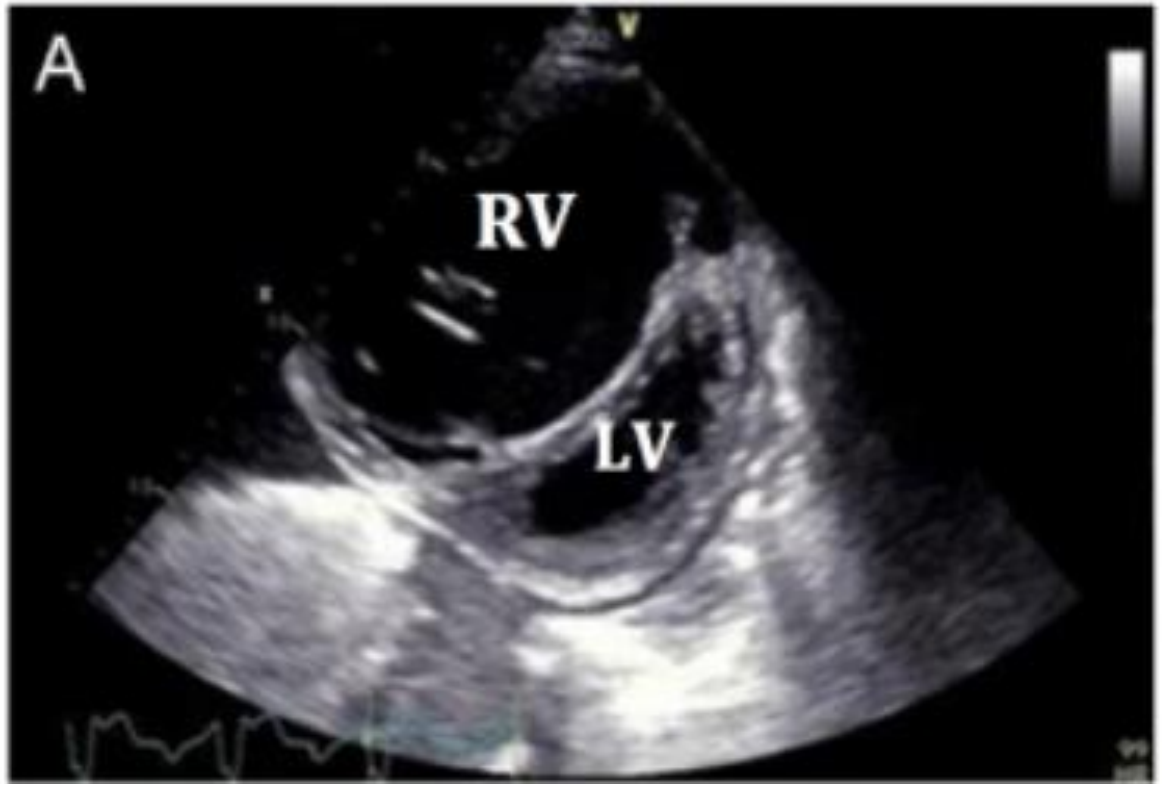




MUNI
MED

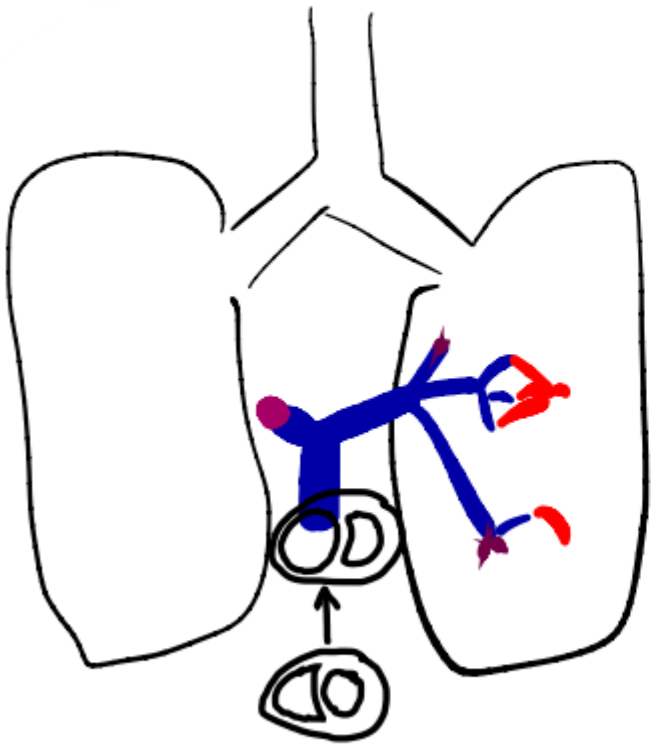
# Pulmonary embolism - echocardiography





MUNI MED

# Massive pulmonary embolism



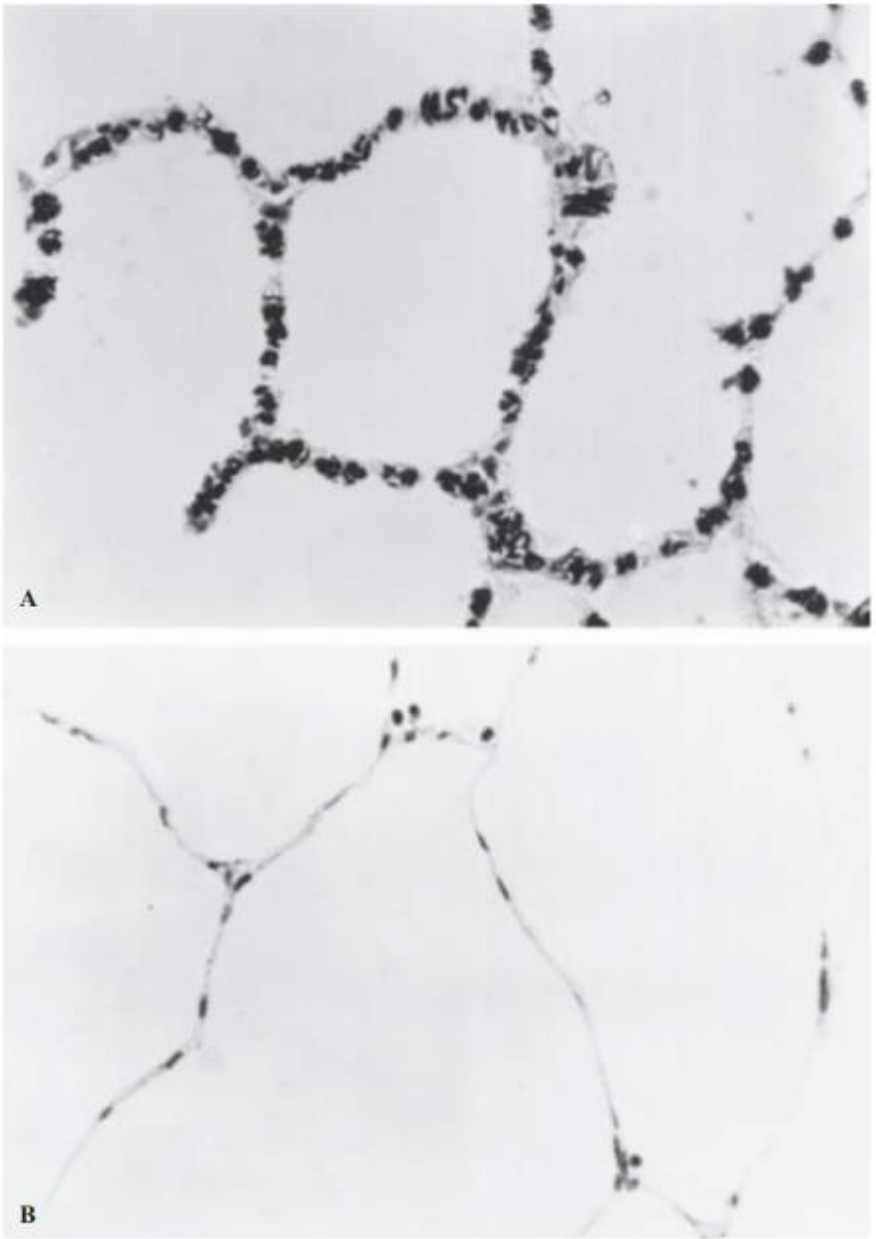


Figure 10.3. **Effect of raised airway pressure on the histologic appearance of pulmonary capillaries. A.** Normal appearance. **B.** Collapse of capillaries when alveolar pressure is raised above capillary pressure. (From Glazier JB, Hughes JMB, Maloney JE, et al. Measurements of capillary dimensions and blood volume in rapidly frozen lungs. J Appl Physiol 1969;26:65–76.)

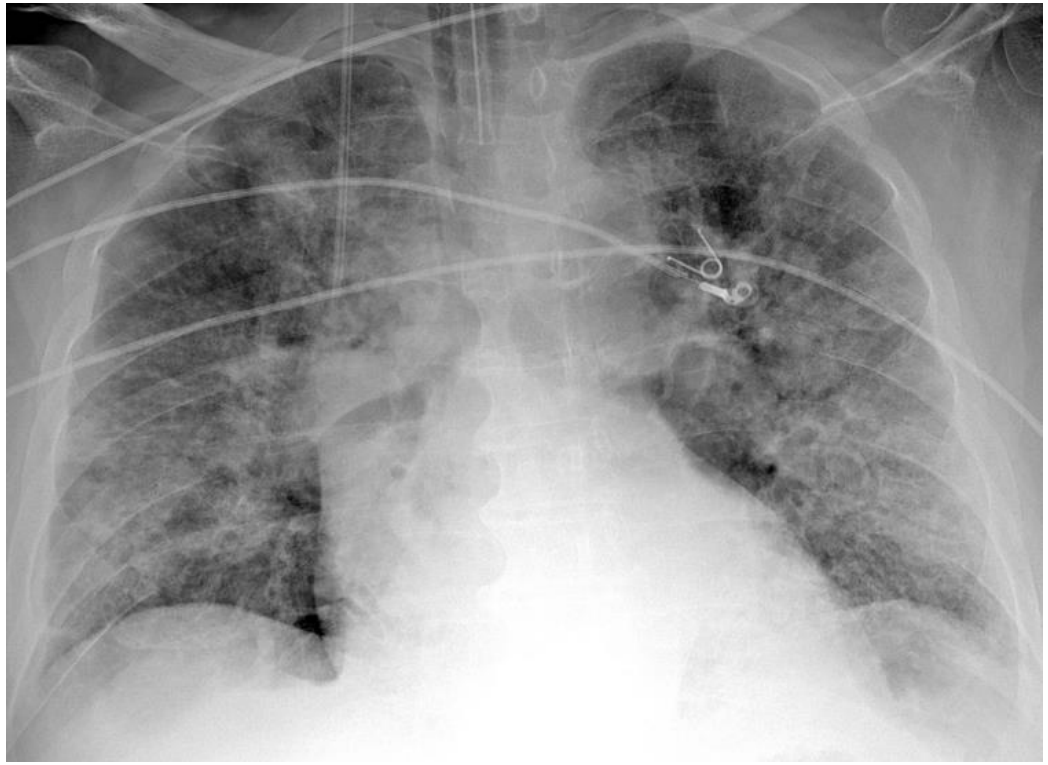
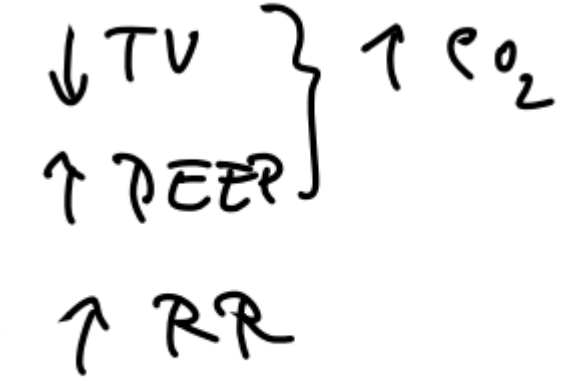
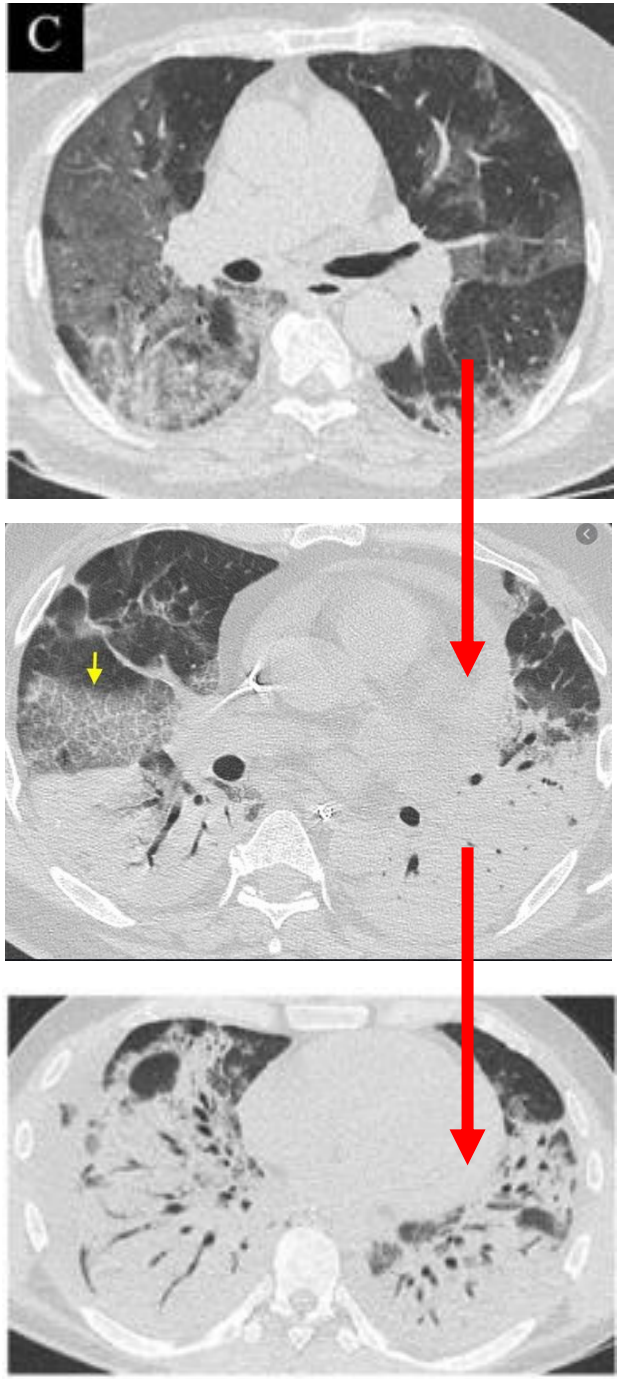
MUNI MED

# ARDS – COVID-19 pneumonia

- protective ventilation
- permissive hypercapnia (pH >7.2)
- prone position







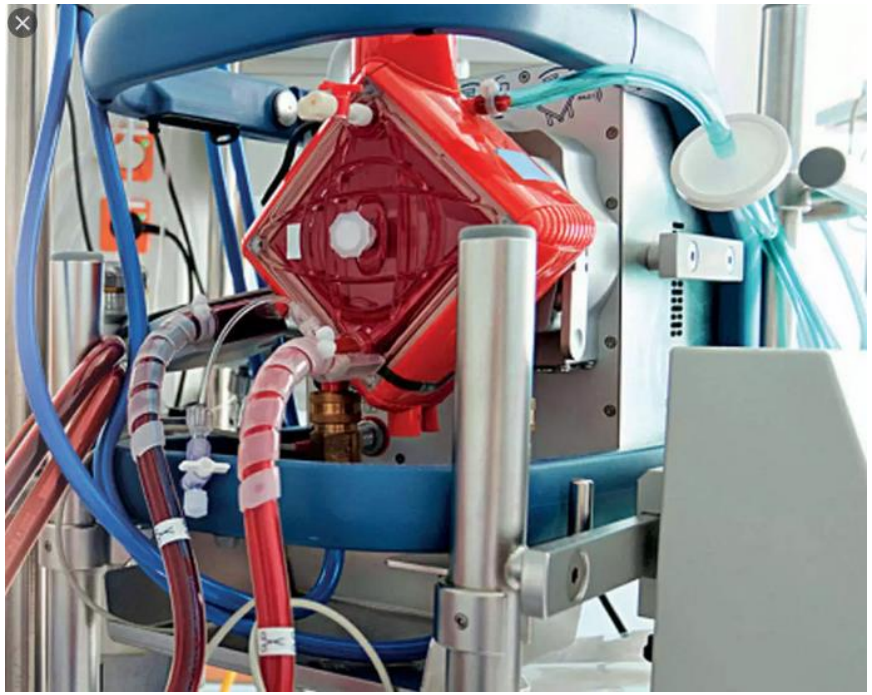
MUNI
MED

# High-flow nasal oxygen (HFNO)

- just as nasal cannula, but
  - humidified oxygen up to 60 l/min
  - $FiO_2$ up to 100 %
- high flow of gases builds up excess pressure in upper airways and so the PEEP 2-4 $cmH_2O$
- better tolerated than NIV
- similar indications as NIV
  - moderate COVID-19 pneumonia
  - acute COPD exacerbation
  - moderate cardiogenic pulmonary edema
  - intermittent support after extubation

MUNI
MED

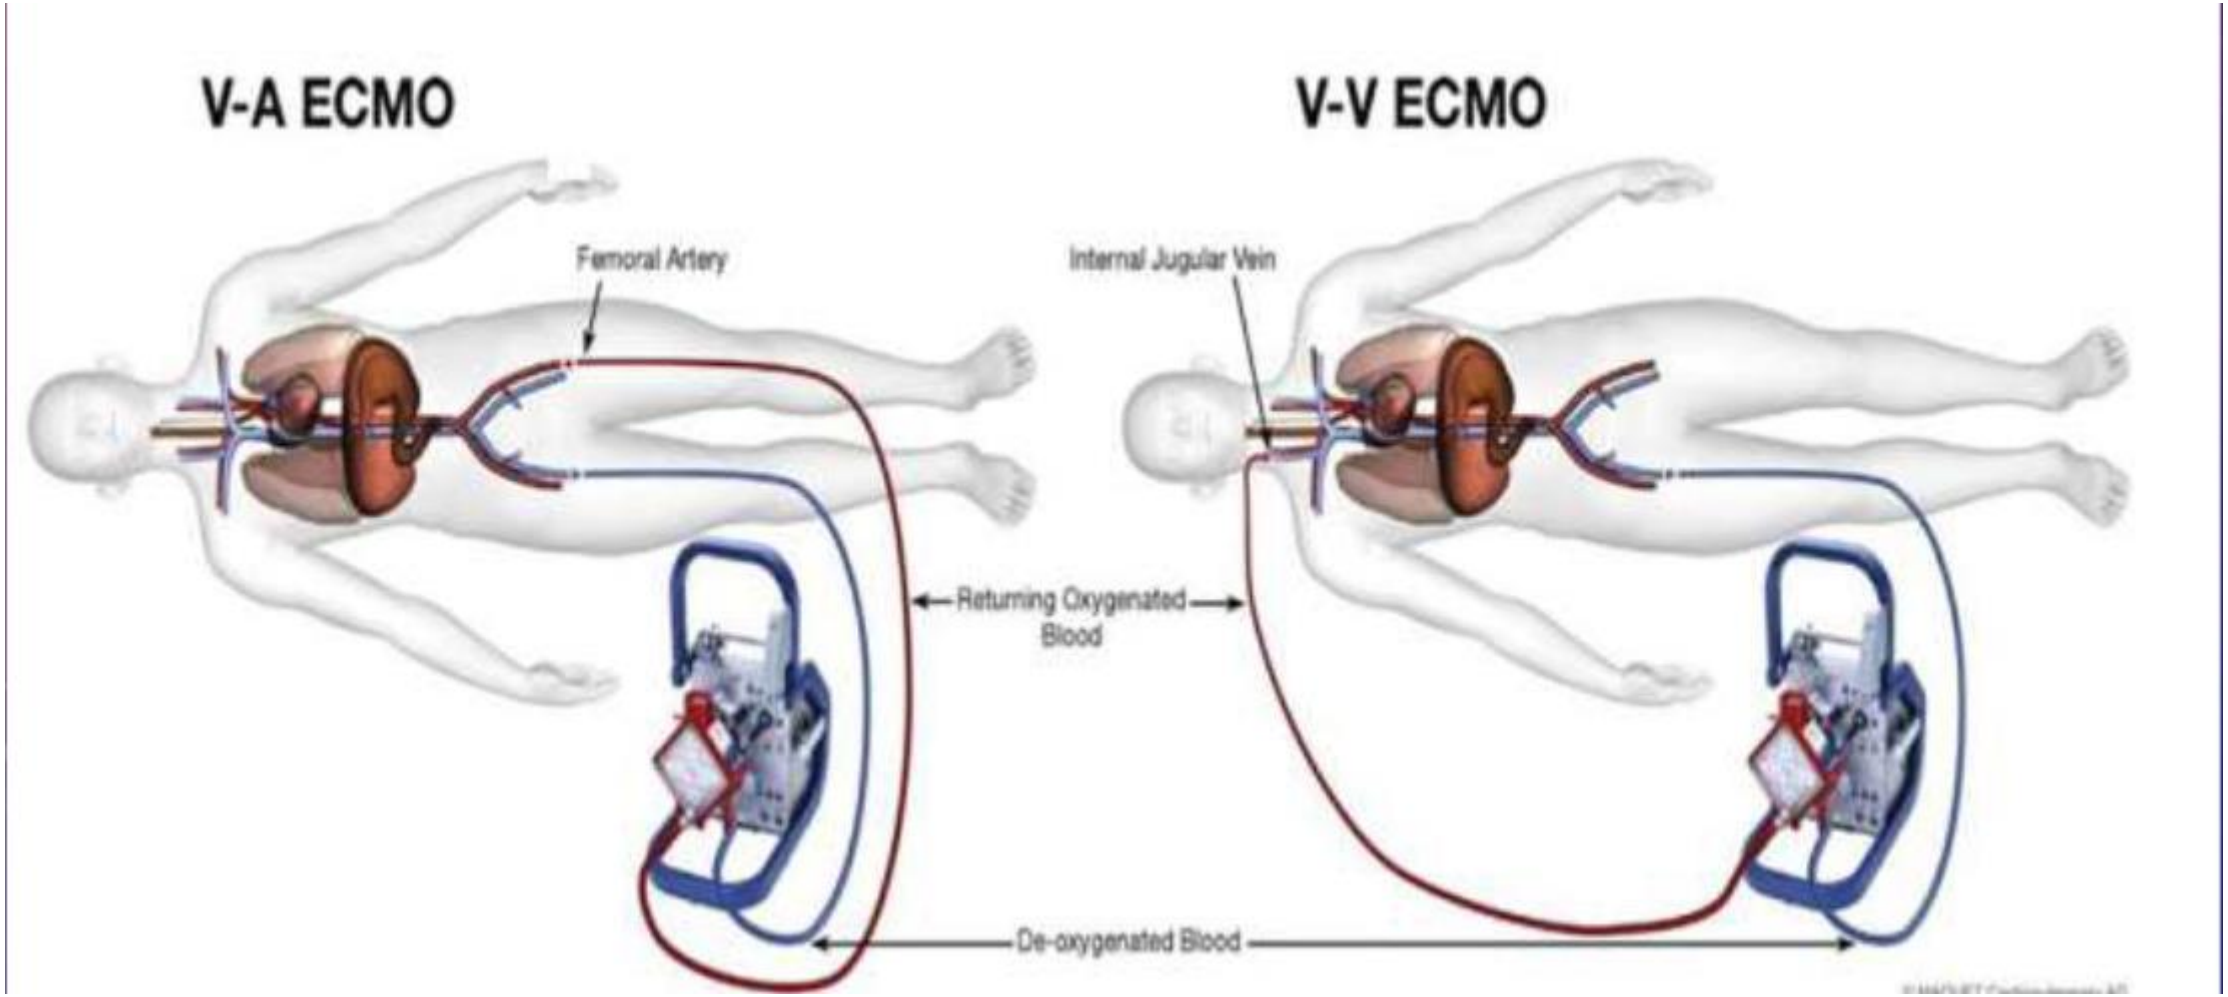
# Extracorporeal membrane oxygenation (ECMO)



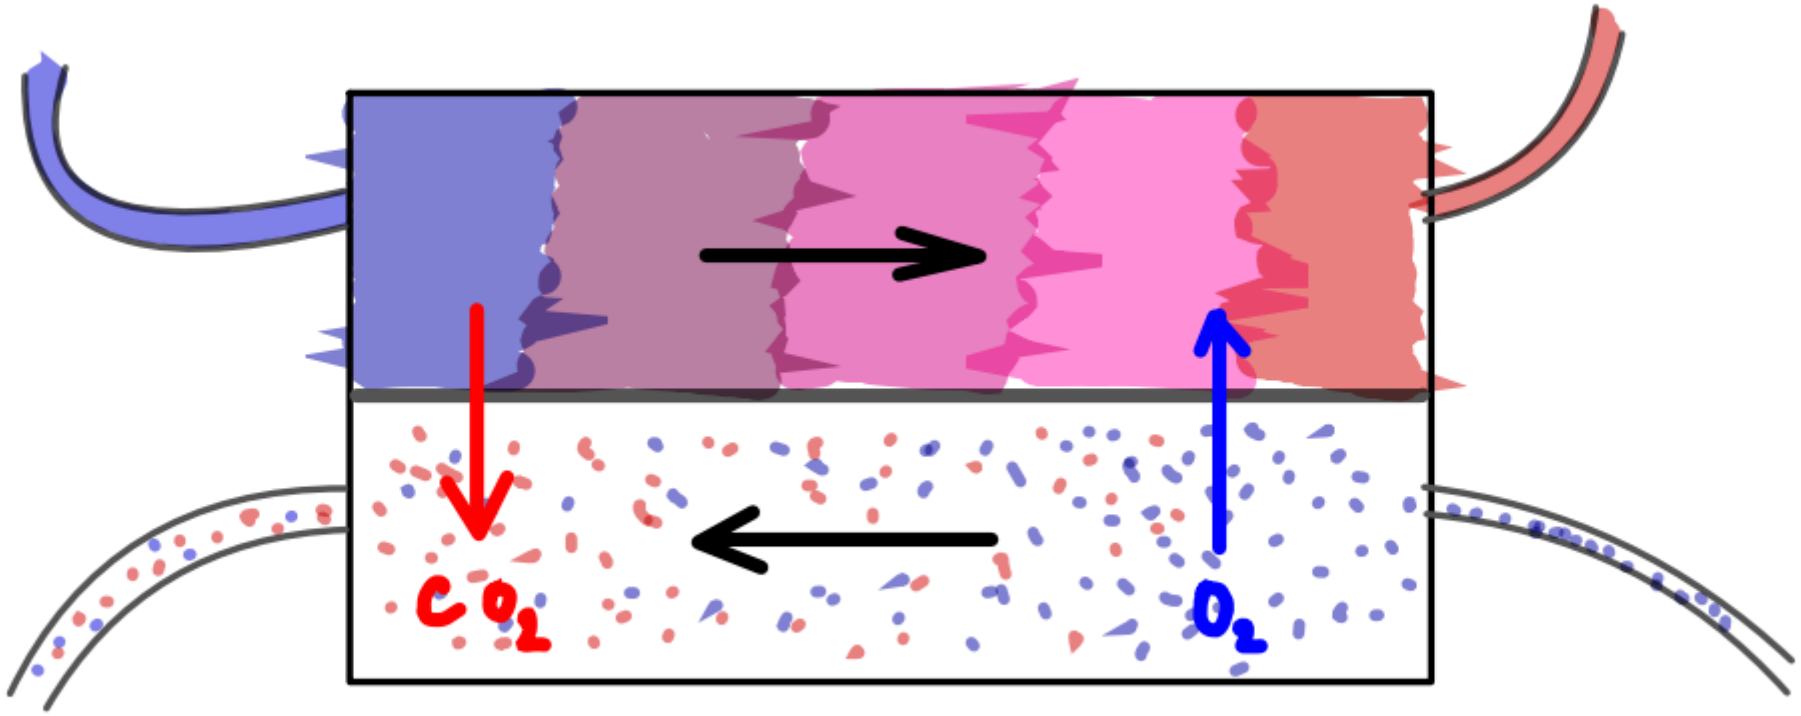
- extracorporeal circuit
- up to complete substitute of lungs (VV-ECMO) or heart and lungs (VA-ECMO)
- construction based on pump and oxygenator
- in oxygenator blood and air/oxygen come to contact over a membrane

- Indication
  - reasonable chance of solution of the basic problem (as e.g. cure of COVID pneumonia) or bridge-to-transplantation

# Extracorporeal membrane oxygenation (ECMO) variants

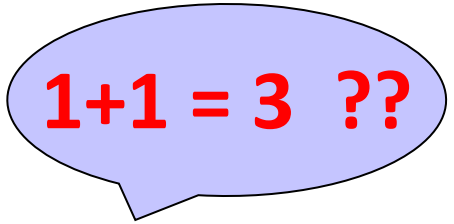


# Principle of membrane oxygenator



MUNI MED

# Apneic ventilation



- apneic test of brain death

1. the patient breathes $O_2$ through the mask, creating an oxygen reserve in the lungs
2. general anaesthesia and muscle relaxation
3. the patient is not breathing, but we continue to administer $O_2$

How long does it take for the patient to desaturate?
The lung $O_2$ reserve (5 l) would be sufficient for a maximum of 20 min at 250 ml $O_2$ /min.

**Up to 60 minutes!!**

# Apnoic ventilation
