

**Small
molecule
antioxidants
in action**

Antioxidants

Macromolecule – enzymatic, non-enzymatic

Small molecule – natural, synthetic

Physical abundance – cytoplasmatic (hydrophilic), membrane (lipophilic)

When to use antioxidants

Therapy of disease (inflammation, ischemia)

Support therapy (diabetes mellitus)

Prevention (food supplements)

Food preservation (nontoxic, healthy)

Technical products stabilization (low toxicity)

Mechanism of action

Prevention of forming RONS – chelating agents

Removing RONS – trapping, quenching

Decomposition of products of reactions with RONS – repairing mechanisms

EDARAVON - Therapy of neurodegenerative disease and stroke

Antioxidant efficiency

1. Highest possible reduction potentials between radical and antioxidant
2. Radicals formed from antioxidants must be relatively stable

| ROS | E (mV) |
|--------------------|--------|
| Asc· – | 282 |
| TO· | 480 |
| O ₂ · – | 940 |
| RO· | 1600 |
| HO· | 2310 |

Antioxidants – hydrogen donors

Most commonly contains aromatic cycle with one or more hydroxyl groups

Radical is stabilized by electron delocalization

Radical can oxidize further

Antioxidants – hydrogen donors

Lipoperoxidation

Deterioration of sensorics properties

- Odor after "rancidity"
- Changes in color and texture
- Loss of consumer interest
- Economic losses

Deterioration of nutrition quality

- Essential fat acids

Health risks

- GIT, cardiovascular diseases

Dietary antioxidants

Ascorbic acid (vitamin C)

Strong reducing agent

High intake – risk of Fenton reaction

Hydroxyl radical formation

$\text{Fe(III)} + \text{ascorbate} \longrightarrow \text{Fe(II)} + \text{ascorbate.}$

$\text{H}_2\text{O}_2 + \text{Fe(II)} \longrightarrow \text{HO}\cdot + \text{OH}^- + \text{Fe(III)}$

Dietary antioxidants

Tocopherols (vitamin E)

* = chiral centre

| | R' | R'' |
|--------------------------|------------------|------------------|
| <i>alpha</i> -tocopherol | —CH ₃ | —CH ₃ |
| <i>beta</i> -tocopherol | —CH ₃ | —H |
| <i>gamma</i> -tocopherol | —H | —CH ₃ |
| <i>delta</i> -tocopherol | —H | —H |

tocotrienols

Dietary antioxidants

Tocopherols (vitamin E)

Flavonoids– example of action

Curcumin – neuroprotective, anti-inflammatory

Carnosol – lipoperoxidation reduction

Quercetin – colorectal carcinom reduction

Resveratrol – antiaging, CVS, CA, diabetes

Sofalcone - antiulcerosum, anti-inflammatory

Dietary antioxidants

Carotenoids

lykopen

β -karoten

α -karoten

lutein

echinenon

Dietary antioxidants

Carotenoids – mechanism of action

Dietary antioxidants - Flavonoids

Flavonoidy

flavan

flavanon

flavon

flavonol

Dietary antioxidants - Flavonoids

Flavany

katechin

epigallokatechin

epikatechingallát

epigallokatechingallát

Dietary antioxidants - Flavonoids

Flavanony

taxifolin

naringenin

Flavony

luteolin

apigenin

Dietary antioxidants - Flavonoids

Flavonoly

Dietary antioxidants – Flavonoids

Mechanism of action

Dietary antioxidants - Stilbens

trans-resveratrol

cis-resveratrol

trans-piceid

cis-piceid

Dietary antioxidants - Stilbens

trans-resveratrol

cis-resveratrol

trans-piceid

cis-piceid

Dietary antioxidants - Stilbens

Resveratrol

Dietary antioxidants - Curcumin

Curcuma longa L. (Zingiberaceae)

Dietary antioxidants – Aromatic acids

Rosmarinic acid

Chlorogenic acid

Dietary antioxidants – Nitrogen based antioxidants

Caffeine

Dietary antioxidants – Chelating agents

Formation complexes with metallic ions

Prevention of oxidative state changes of metallic ion

Sterically shielding metallic ion and lipid radical

Dietary antioxidants – Chelating agents

Cu(I)
Fe(III)

Cu(II)
Fe(II)

Endogenous antioxidants

Ubiquinone (coenzyme Q10)

Bilirubin

Melatonin

Lipoic acid

Uric acid

Melanine

Retarders vs. antioxidants

Retarders – just slowing oxidation and requires high concentration

HO* - reaction rate constant - $10^9 - 10^{10} \text{ M}^{-1} * \text{s}^{-1}$

Effective antioxidant $1 * 10^{13} \text{ M}^{-1} * \text{s}^{-1}$

Impossible in water $1 * 10^{11} \text{ M}^{-1} * \text{s}^{-1}$

HO· no antioxidants just retarders

Retarder

Oxidation products without

retarder

Oxidation products with retarder

More retarder and lots of it.

Antioxidant - no recycling

Reaction rate constants

| | |
|---|--|
| SOD | $7 \times 10^9 \text{ M}^{-1}\text{s}^{-1}$ |
| HO· | $1.1 \times 10^{10} \text{ M}^{-1}\text{s}^{-1}$ |
| RO· (tert-butyl alkoxy radical) | $1.6 \times 10^9 \text{ M}^{-1}\text{s}^{-1}$ |
| ROO· (alkyl peroxy radical, e.g. CH ₃ OO·) | $1\text{-}2 \times 10^6 \text{ M}^{-1}\text{s}^{-1}$ |
| Cl ₃ COO· | $1.8 \times 10^8 \text{ M}^{-1}\text{s}^{-1}$ |
| GS· (glutathionyl radical) | $6 \times 10^8 \text{ M}^{-1}\text{s}^{-1}$ |
| UH·- (Urate radical) | $1 \times 10^6 \text{ M}^{-1}\text{s}^{-1}$ |
| TO· (Tocopheroxyl radical) | $2 \times 10^5 \text{ M}^{-1}\text{s}^{-1}$ |
| Asc·- (dismutation) | $2 \times 10^5 \text{ M}^{-1}\text{s}^{-1}$ |
| CPZ·+ (Clorpromazine radical radical) | $1.4 \times 10^9 \text{ M}^{-1}\text{s}^{-1}$ |
| Fe(III)EDTA/ Fe(II)EDTA » | $1 \times 10^2 \text{ M}^{-1}\text{s}^{-1}$ |
| O ₂ ·-/HO ₂ · | $2.7 \times 10^5 \text{ M}^{-1}\text{s}^{-1}$ |

Thank you
