

# Enterprise Architektra

Informační management VIKMA07

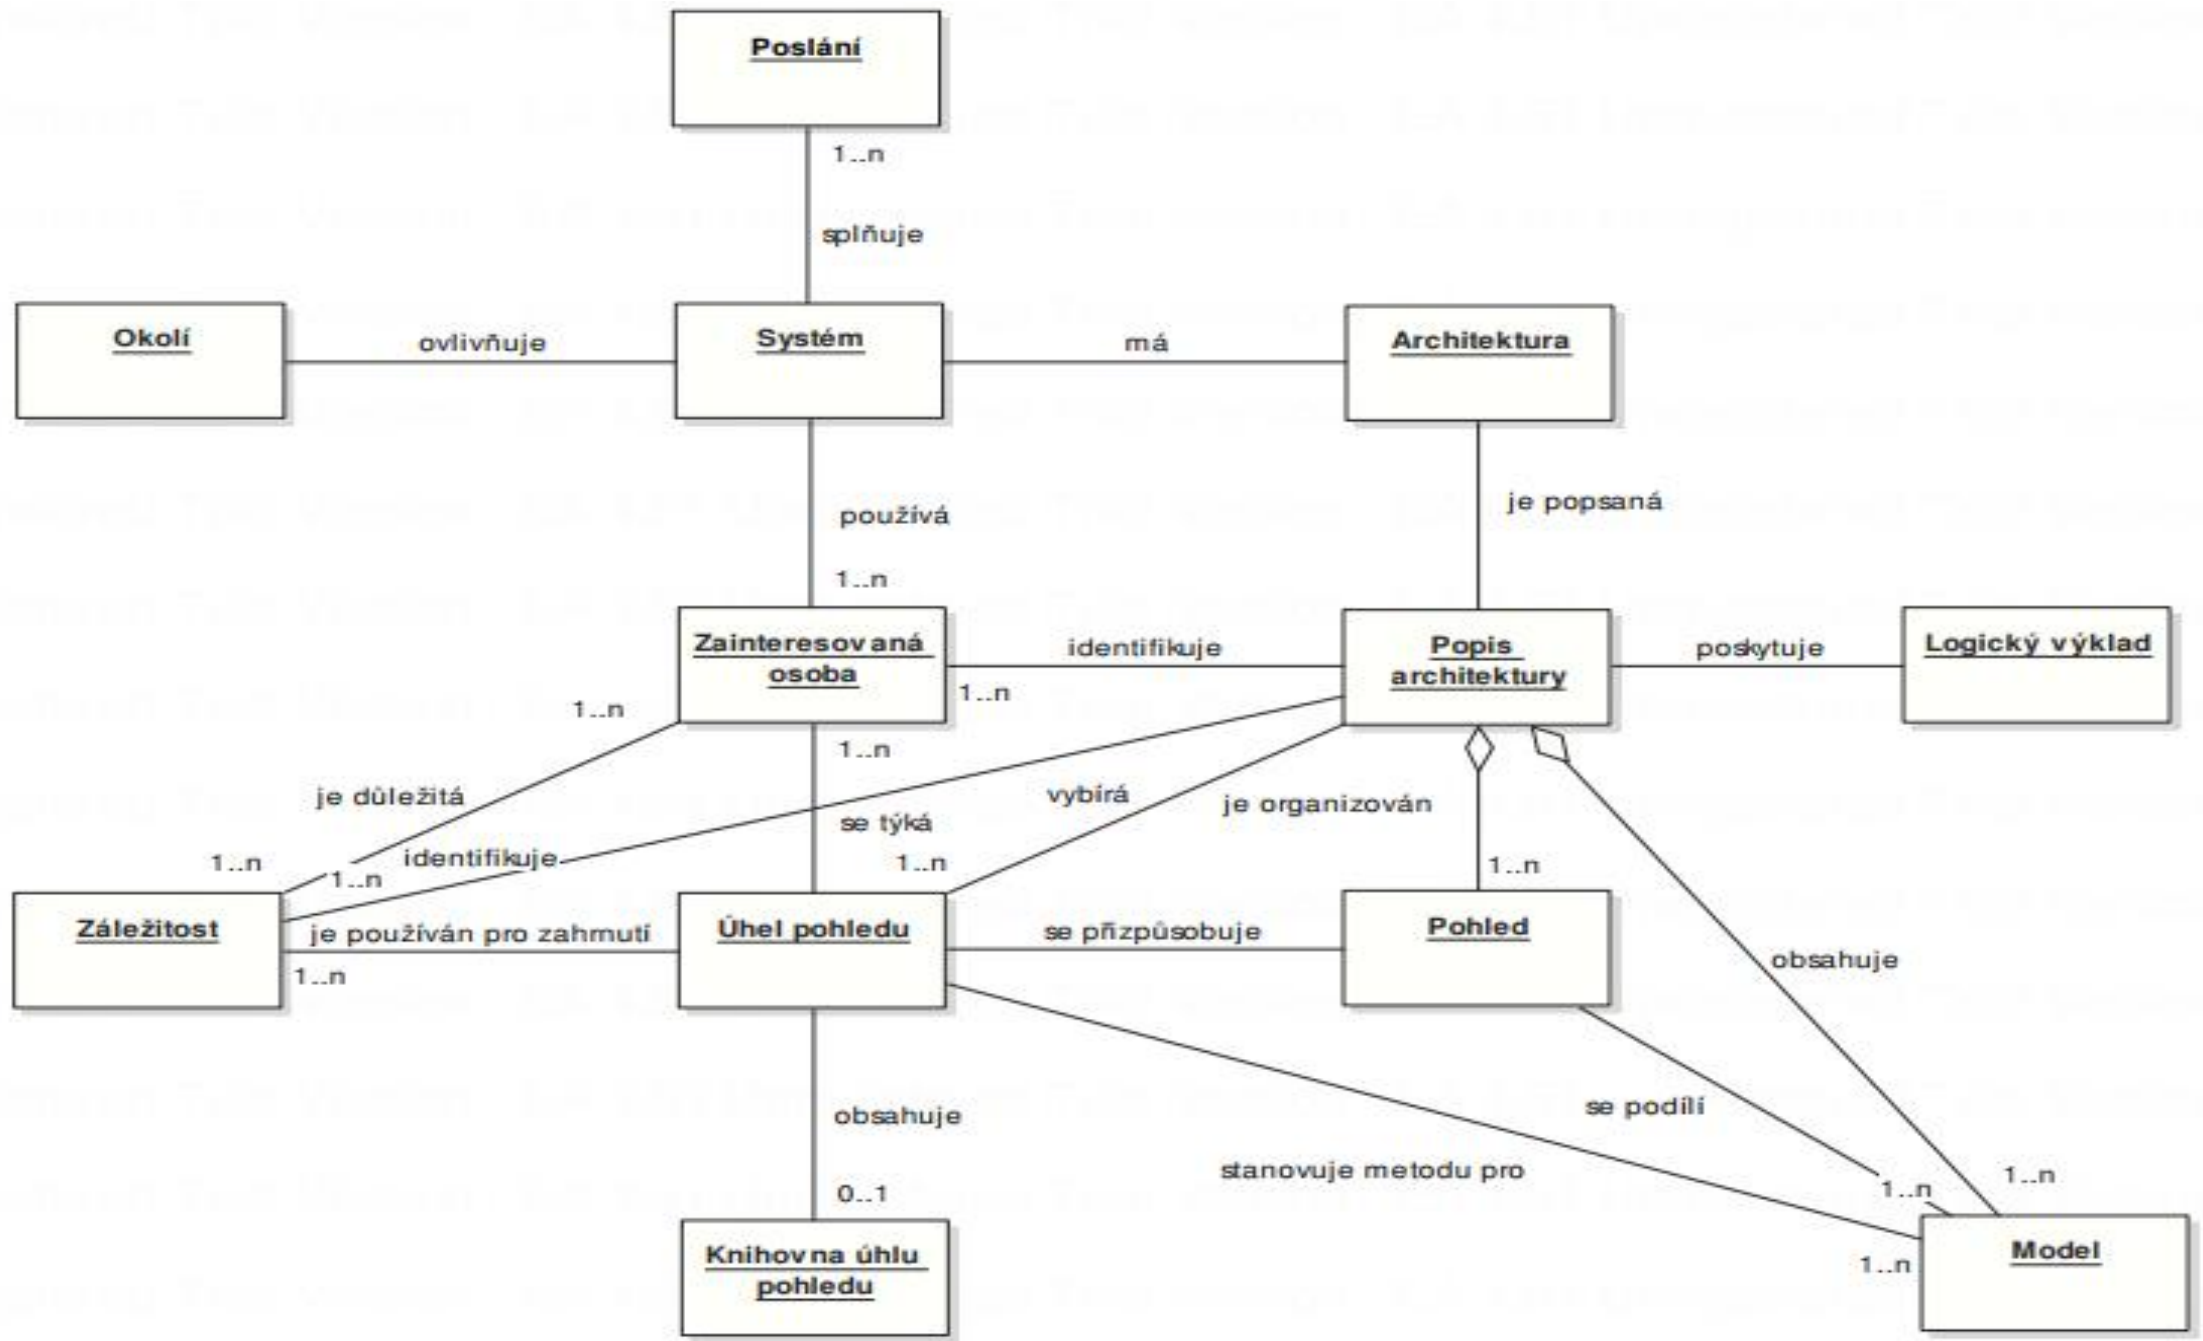

Mgr. Jan Matula, PhD.

177798@mail.muni.cz

III. blok

# Architektura

- Formální popis systému nebo jeho detailní plán na úrovni komponent vedoucí k jeho implementaci.
- Struktura komponent a jejich vazeb včetně principů a návodů, které řídí návrh a rozvoj v čase.
- Definice podnikové architektury (Enterprise Architecture) vychází z normy ISO 42010, která uvádí, že architekturou se myslí: „základní organizace systému ztělesněná jeho složkami, jejich vzájemnými vztahy a vztahy k prostředí a principy, kterými se řídí její návrh a vývoj.“

# 6 praktik pro popis architektury

- vztahovat dokumentaci k informaci o verzi,
- identifikovat osoby zainteresované na systému,
- vybrat správné architektonické pohledy,
- spojit je s relevantními úhly pohledu,
- dodržovat konzistenci mezi pohledy architektury,
- rozumně a promyšleně vybírat aktuální architekturu z daných alternativ.

# Cíle EA

- Hlavním cílem podnikové architektury (EA) je zohlednit popis cílů organizace (definovaných v podnikové strategii), způsobů jak jsou tyto cíle dosahovány pomocí podnikových procesů a způsobů, jak mohou tyto procesy být podpořeny technologiemi.
- Vhodné nastavení podnikové architektury (resp. IT architektury) je základním předpokladem pro efektivní fungování celé organizace. Pokud není architektura nastavená správně, dochází k výraznému omezení rozvoje organizace, které může vést k omezení obchodní aktivity (což vede ke nížení příjmů nebo ke zvýšení nákladů na zajištění klíčových procesů).

# Governance architektury

- Způsob jakým jsou podnikové architektury a další architektury řízeny a kontrolovány na úrovni podniku.

# Spaghetti Architecture

# The business benefits of Enterprise Architecture

## A more efficient business operation

- Lower business operation costs
- More agile organization
- Business capabilities shared across the organization
- Lower change management costs
- Improved business productivity

## A more efficient IT operation

- Lower software development, support, and maintenance costs
- Increased portability of applications
- Improved interoperability and easier system and network management
- Improved ability to address critical enterprise--wide issues like security
- Easier upgrade and exchange of system components

## Better return on existing investment and reduced risk for future investment

- Reduced complexity in the business and IT
- Maximum return on investment in existing business and IT infrastructure
- Reduced risk overall in new investments and their cost of ownership

# Vývoj konceptu podnikové architektury

- Kořeny podnikové architektury vychází z teorie IT sladění (IT alignment). Tento přístup reprezentuje neustálou cestu transformace podniku za dosažením strategických byznys cílů, které jsou prostřednictvím informačních technologií umožňovány, podporovány anebo dokonce stimulovány.

# Evoluční stupně EA 1/3

- **Podniková architektura navrhuje organizaci IT** - Podniková architektura se v tomto evolučním stupni orientuje na návrh organizace informačního systému (IS). Předmětem zájmu architektonického návrhu jsou zdroje a schopnosti podnikové informatiky, tj. data, nástroje (hardware), metody a lidé (IT personál).

# Evoluční stupně EA 2/3

- **Podniková architektura navrhuje organizaci podniku** - Podniková architektura v tomto evolučním stupni vystupuje z IT domény a orientuje se zároveň i na návrh organizace, tj. organizační infrastrukturu a procesy.
- Předmětem zájmu architektonického návrhu, vedle již zmíněných zdrojů a schopností podnikové informatiky, které byly architektonicky navrhovány v předchozím evolučním stupni a nyní by již v podniku měly být tyto činnosti dobře zvládnuty, jsou následující objekty: aktér; byznys pravidlo; byznys schopnost; čas; hybná síla; lokalita; majetek; metrika; organizační jednotka; politika a regulace; procesy; produkt; projekt; role řízení kvality, shody a udržitelnosti; taktika, úkol, znalost a informace.

# Evoluční stupně EA 3/3

- **Podniková architektura podporuje návrh strategie podniku** - Podniková architektura se v tomto evolučním stupni podílí na formování strategie podniku a stává se prostředkem organizačních inovací a zajištění udržitelného rozvoje podniku. Předmětem jejího zájmu je návrh souladu strategie s charakteristikami okolí podniku, ať je již vnímáno jako množina prvků (zákazníci, dodavatelé, konkurence) nebo jako klíčové politické, legislativní, ekonomické, sociokulturní, technologické a environmentální faktory.
- Přitom se snaží architektonicky formovat nejen strategii samotnou, ale prostřednictvím inovací navrhovat změny právě i prvků a faktorů, které utvářejí okolí podniku. Ke klíčovým objektům, které jsou architektonicky navrhovány, patří vize a cíle podniku, strategie dosažení těchto cílů, ale také tzv. motivátory (externí omezení a podmínky, které motivují organizaci k formulaci cílů) a v neposlední řadě externí zainteresované strany (Stakeholders).

# WHAT IS TOGAF?

- TOGAF is an open architecture Framework
  - Methods – ADM
  - Tools
- TOGAF documentation can be downloaded for free at [www.opengroup.org](http://www.opengroup.org)

# Architecture Framework

## **Rámec architektury**

- Konceptuální struktura používající se pro rozvoj, implementaci a údržbu architektury.

# GENERAL DEFINITION

- TOGAF is an architecture framework.
- Provides the methods and tools for assisting in the acceptance, production, use and maintenance of an enterprise architecture
- TOGAF is based on:
  - An iterative process model
  - A re-usable set of existing architecture assets
  - Supported by architectural best practices
- Architecture is:
  - The structure of components, their inter-relationships, and the principles and guidelines governing their design and evolution over time

# The advantages of using TOGAF

- TOGAF represents best practice in architecture development.
  - It has been developed through the collaborative efforts of 300 Architecture Forum member companies from some of the world's leading IT customers and vendors
- Using TOGAF as the architecture framework will allow architectures to be developed that are:
  - Consistent documentation
  - Reflect the needs of stakeholders
  - Employ best practice
  - Follow Current requirements and likely future needs of the business
- TOGAF helps to “demystify” and de-risk the architecture development process
- Provides a platform for adding value, and enables users to build genuinely open systems-based solutions to address their business issues and needs

# Architecture domains

- **Business Architecture**

- Defines the business strategy, governance, organization, and key business processes

- **Data Architecture**

- Describes the structure of an organization's logical and physical data assets and data management resources

- **Application Architecture**

- A blueprint for the individual applications to be deployed, their interactions, and their relationships to the core business processes of the organization

- **Technology Architecture**

- Describes the logical software and hardware capabilities that are required to support the deployment of business, data, and application services
- Includes IT infrastructure, middleware, networks, communications, processing, standards, etc.

# What does TOGAF Contain?

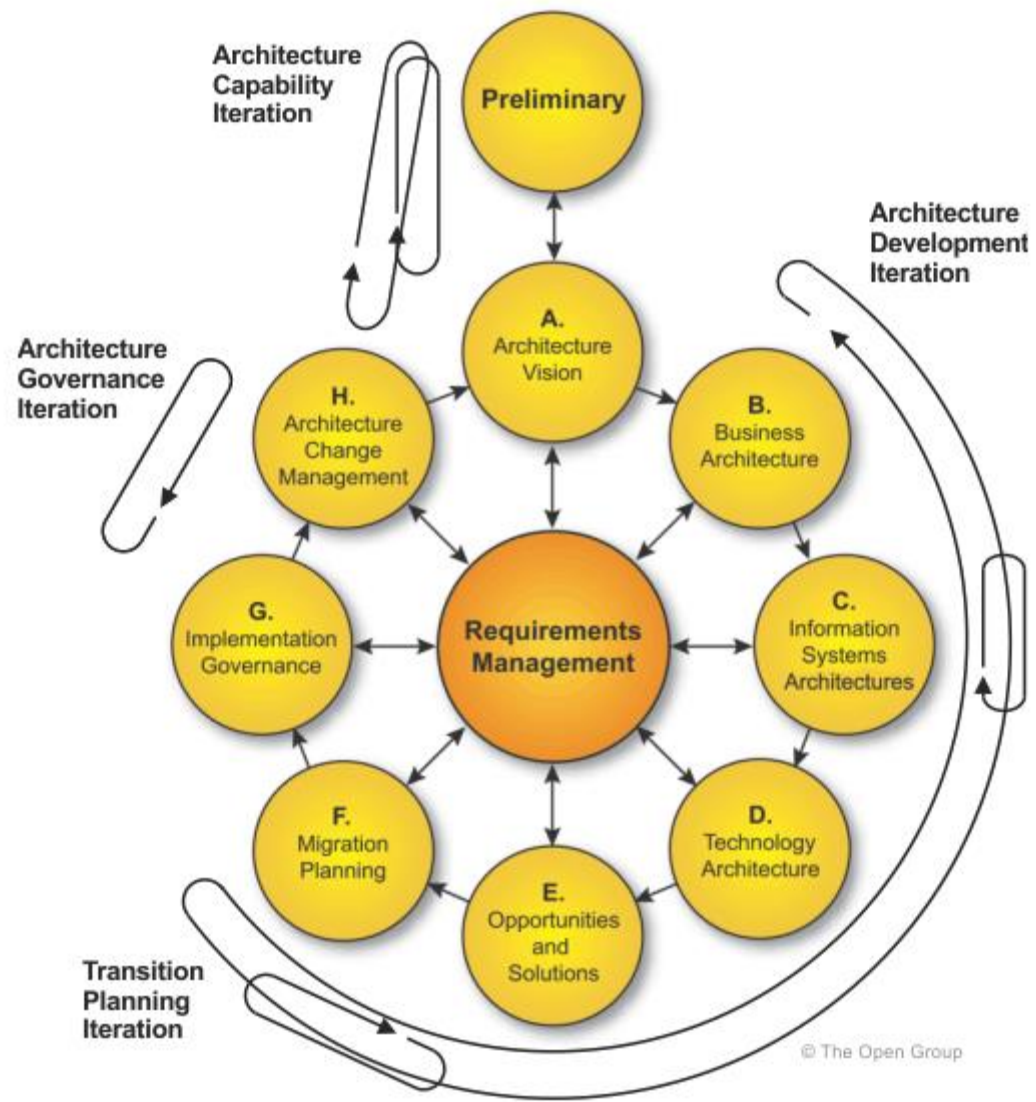

- TOGAF reflects the structure and content of an architecture capability within an enterprise.
- Definition of “**Capability**” - An ability that an organization, person, or system possesses. Capabilities are typically expressed in general and high-level terms and typically require a combination of organization, people, processes, and technology to achieve. For example, marketing, customer contact, or outbound telemarketing.

# The Architecture Development Method (ADM)

- The ADM describes a process for deriving an organization-specific enterprise architecture that addresses business requirements.
- The ADM is the major component of TOGAF and provides guidance for architects on a number of levels:
- It provides a number of **architecture development phases** (Business Architecture, Information Systems Architectures, Technology Architecture) in a cycle, as an overall process template for architecture development activity.

# The Architecture Development Method (ADM)

- It provides a narrative of each architecture phase, describing the phase in terms of objectives, approach, inputs, steps, and outputs. The inputs and outputs sections provide a definition of the architecture content structure and deliverables (a detailed description of the phase inputs and phase outputs is given in the Architecture Content Framework).
- It provides cross-phase summaries that cover requirements management.

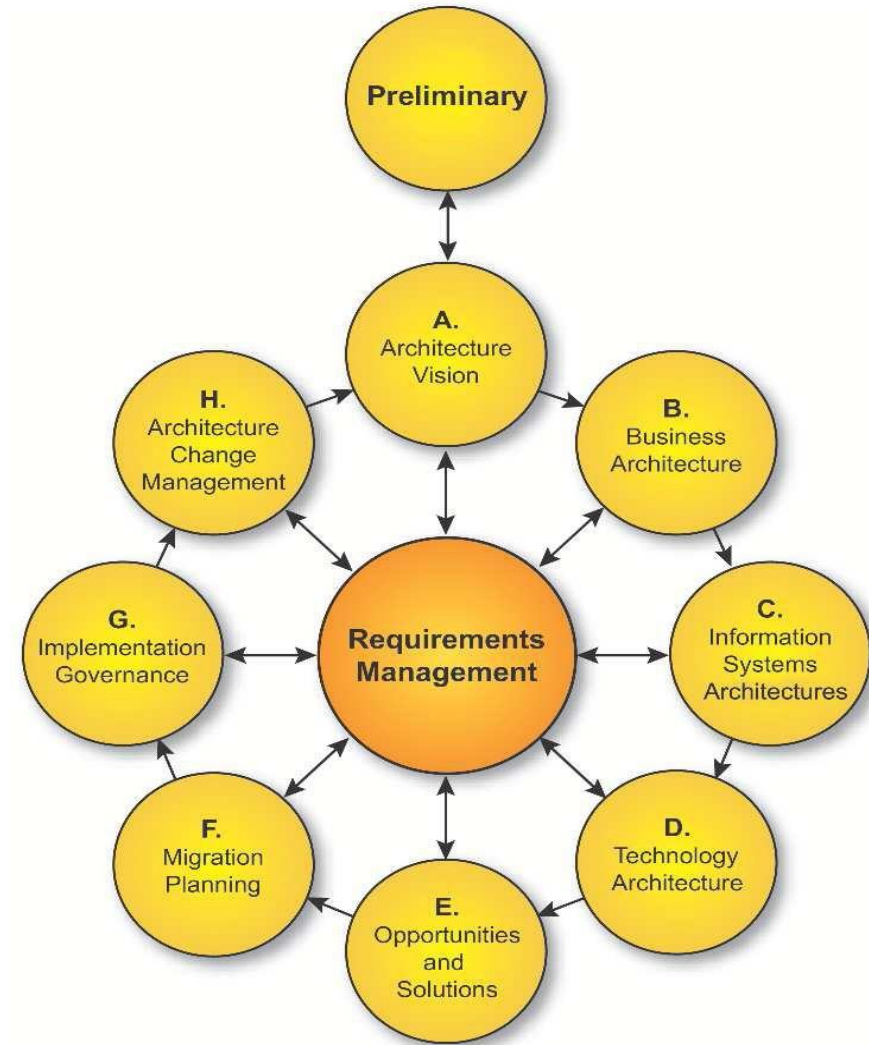

# TOGAF ADM Structure

- A method for developing Enterprise Architecture is the ADM

## ADM = Architecture Development Method

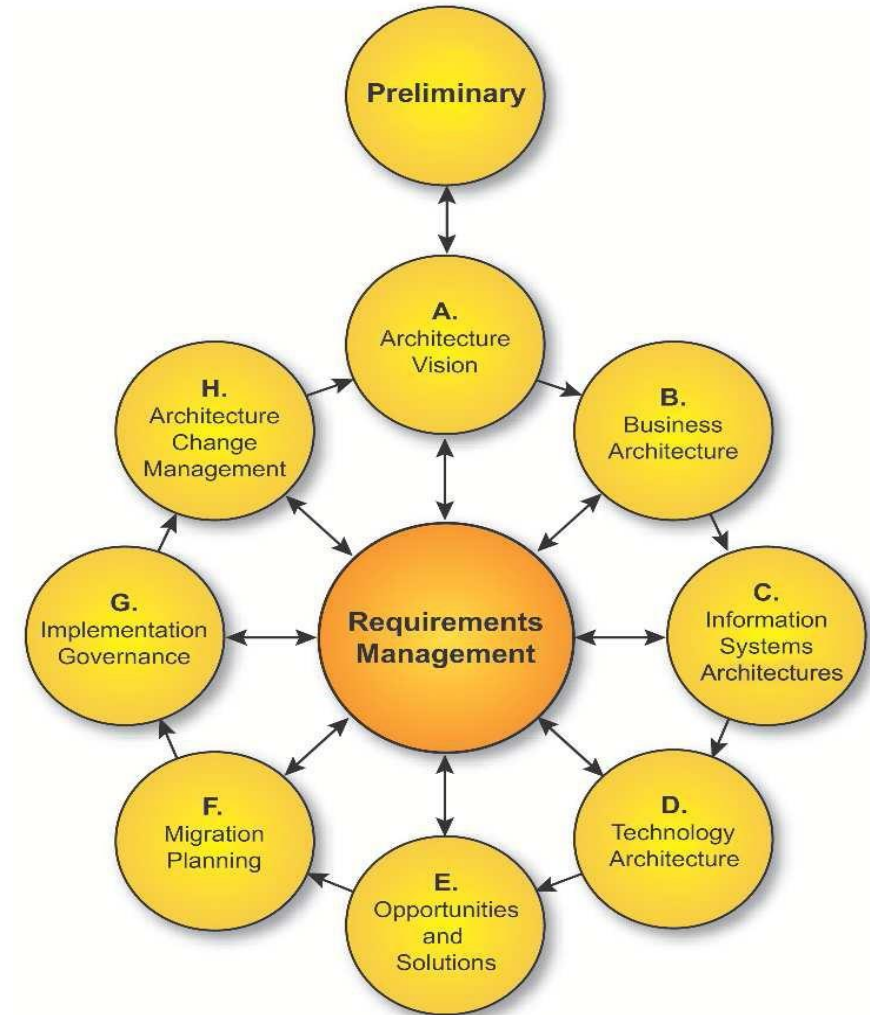

- The core of TOGAF
- A step-by-step approach to develop and use an enterprise architecture

# TOGAF ADM Structure

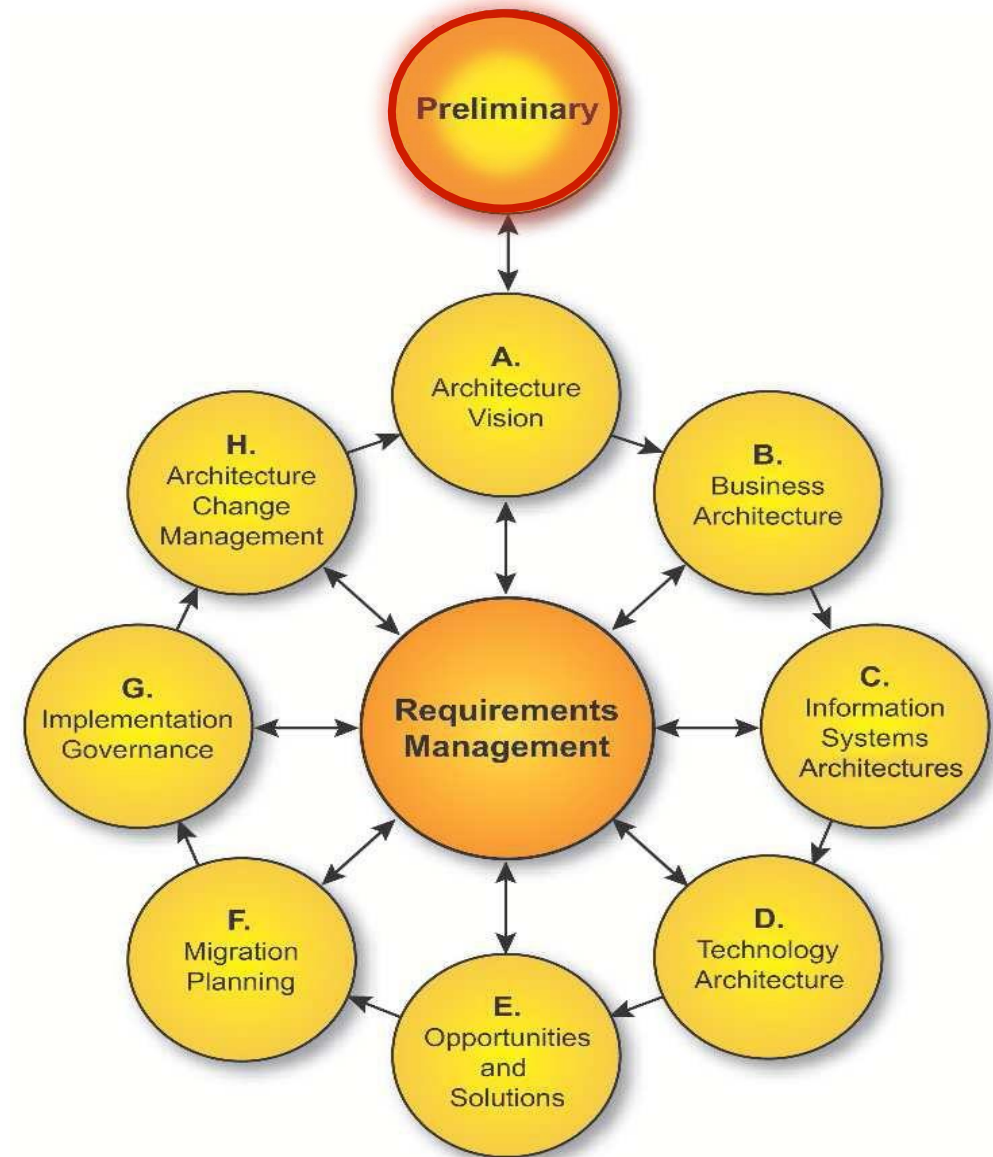

## The ADM consists of 10 phases:

- The Preliminary Phase
- Phase A: Architecture Vision
- Phase B: Business Architecture
- Phase C: Information Systems Architectures
- Phase D: Technology Architecture
- Phase E: Opportunities & Solutions
- Phase F: Migration Planning
- Phase G: Implementation Governance
- Phase H: Architecture Change Management
- Requirements Management

# ADM Preliminary phase

Describes the **preparation and initiation activities** required to create an **Architecture Capability** including customization of TOGAF and definition of **architecture principles**.

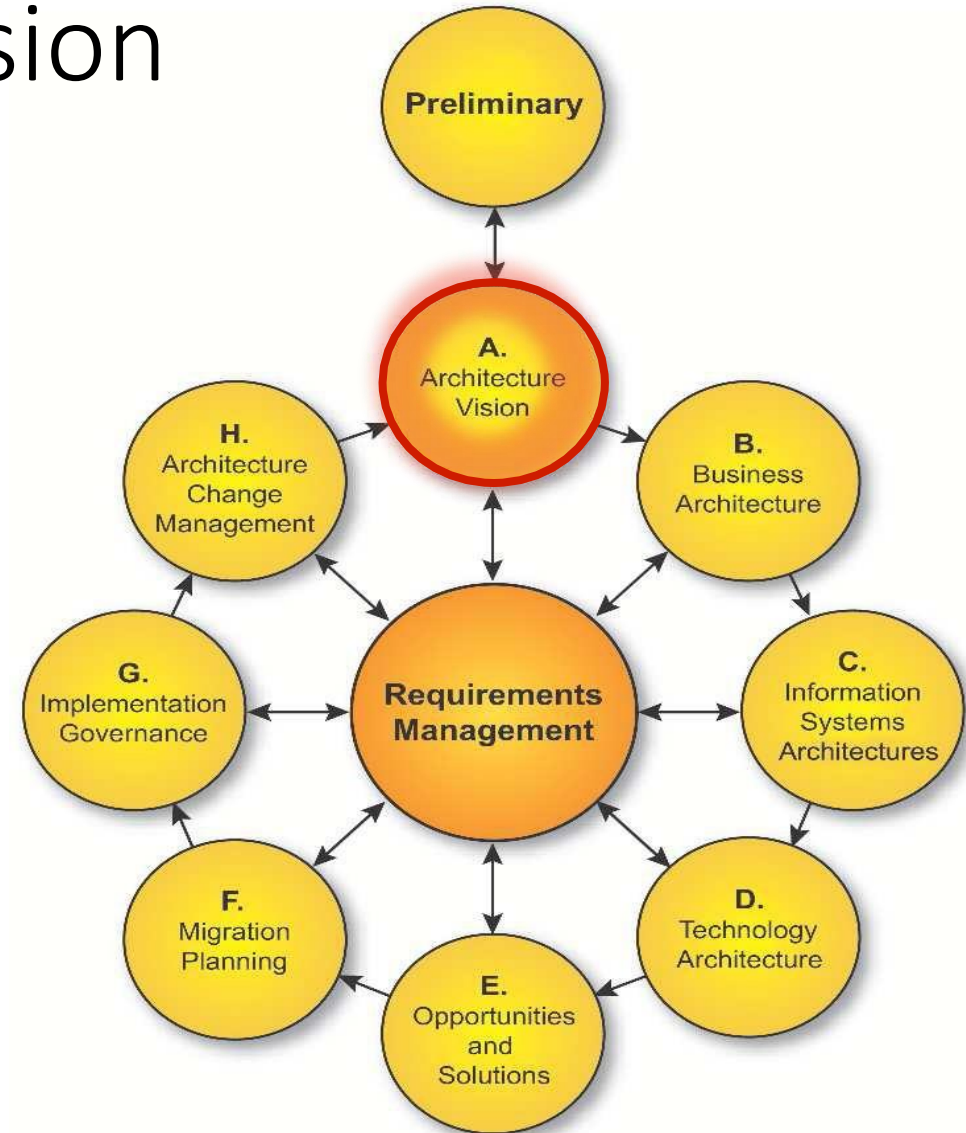

# Phase A: Architecture Vision

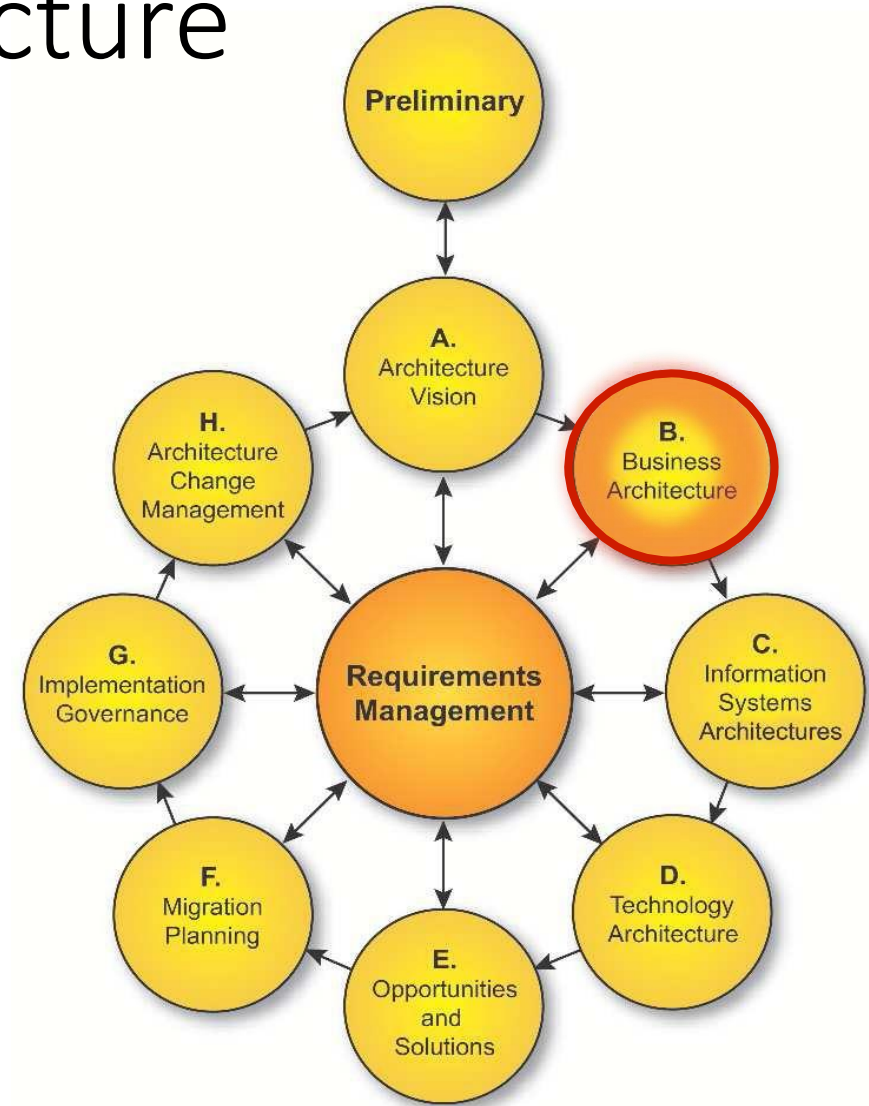

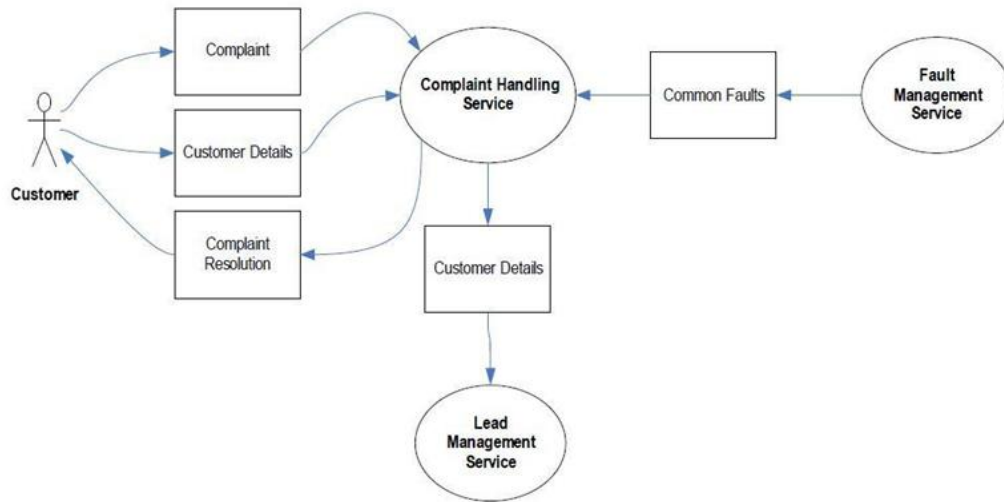

Phase A is the initial phase of an architecture development cycle

- Defining the scope of the architecture development initiative
- Identifying the stakeholders
- Creating the **Architecture Vision in accordance with business needs**
- **Obtaining approval** to proceed with the architecture development

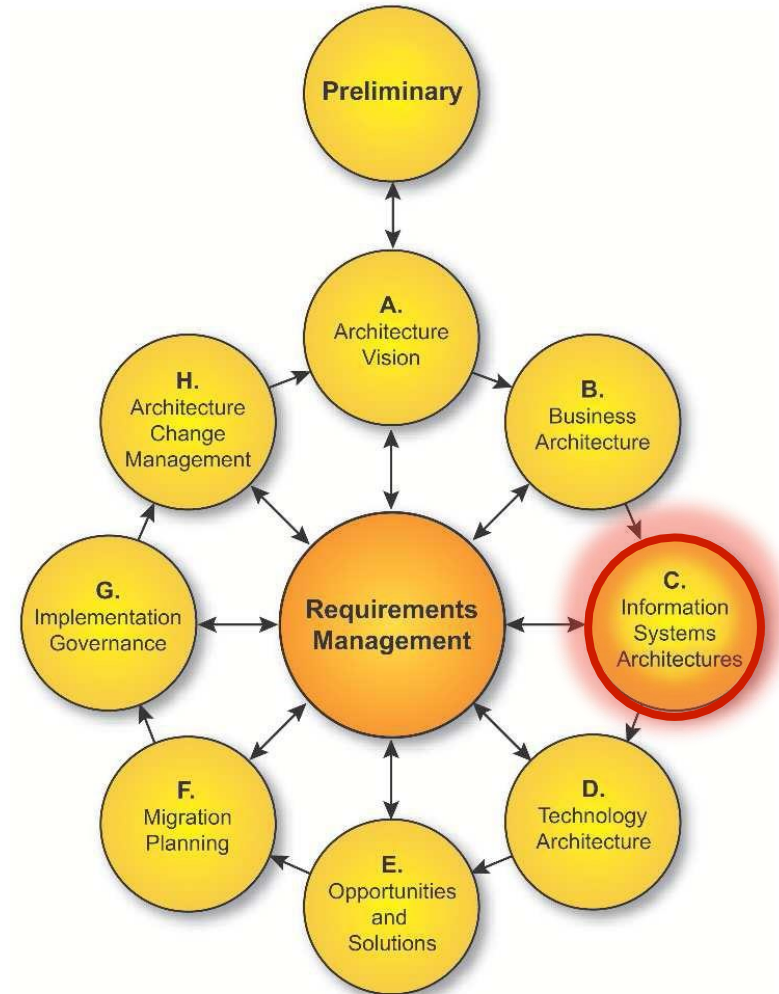

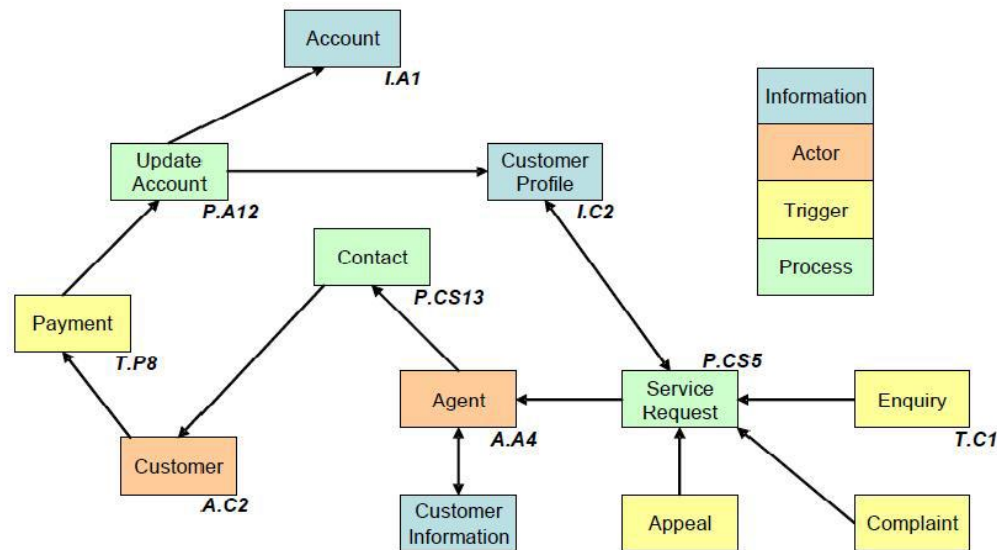

# Phase B: Business Architecture

Phase B: Business Architecture describes the development of a **Business Architecture to support the agreed Architecture Vision**

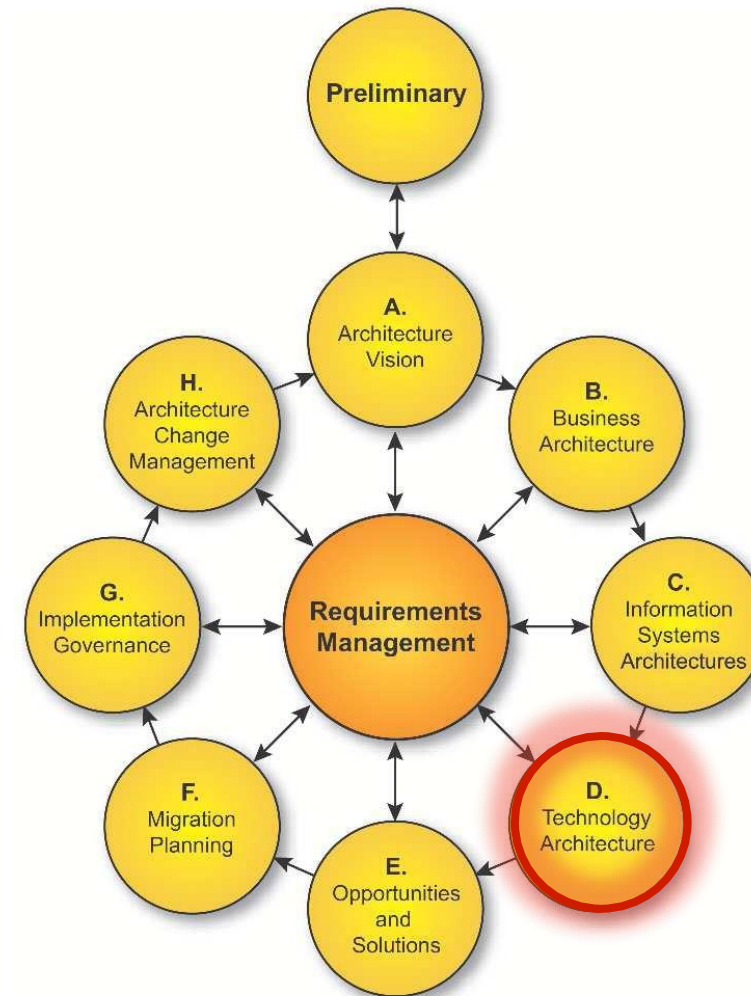

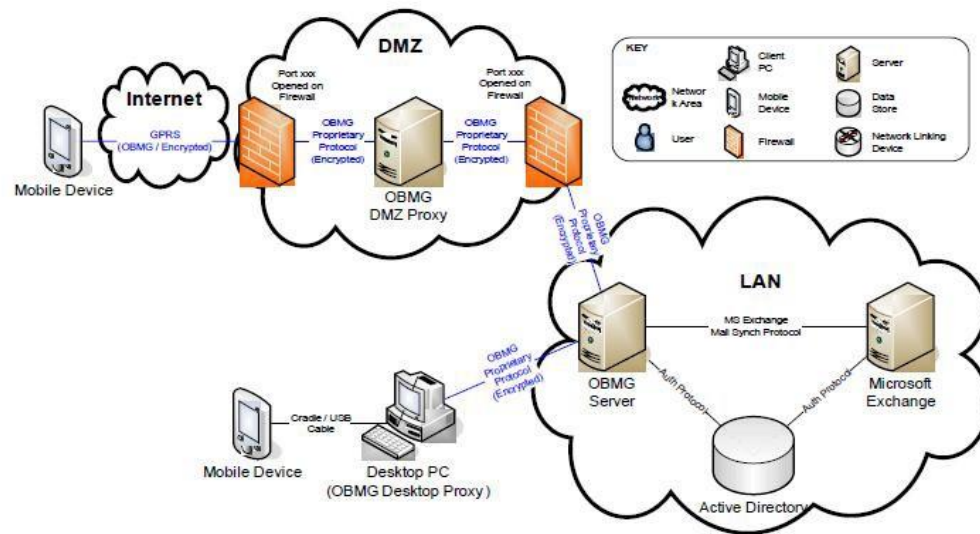

# Phase C: Information Systems Architectures

Phase C: Information Systems Architectures describes the development of **Information Systems Architectures** to support the agreed **Architecture Vision**

# Phase D: Technology Architecture

Phase D: Technology Architecture describes the development of the **Technology Architecture** to support the agreed **Architecture Vision**

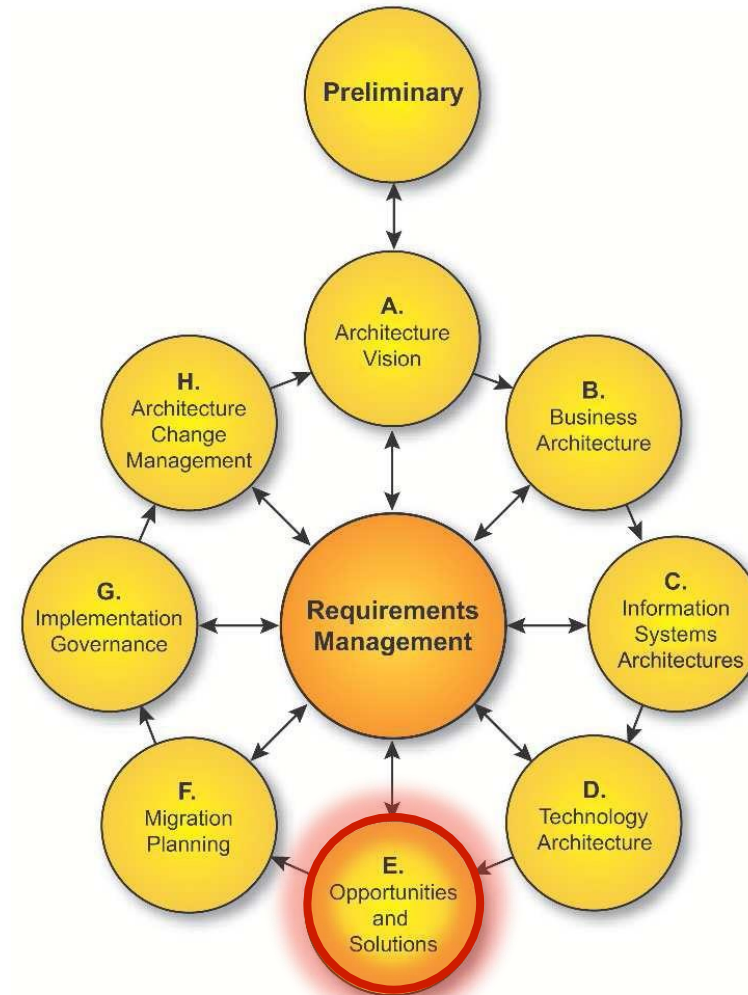

# Phase E: Opportunities & Solutions

Phase E describes **initial implementation & migration planning**

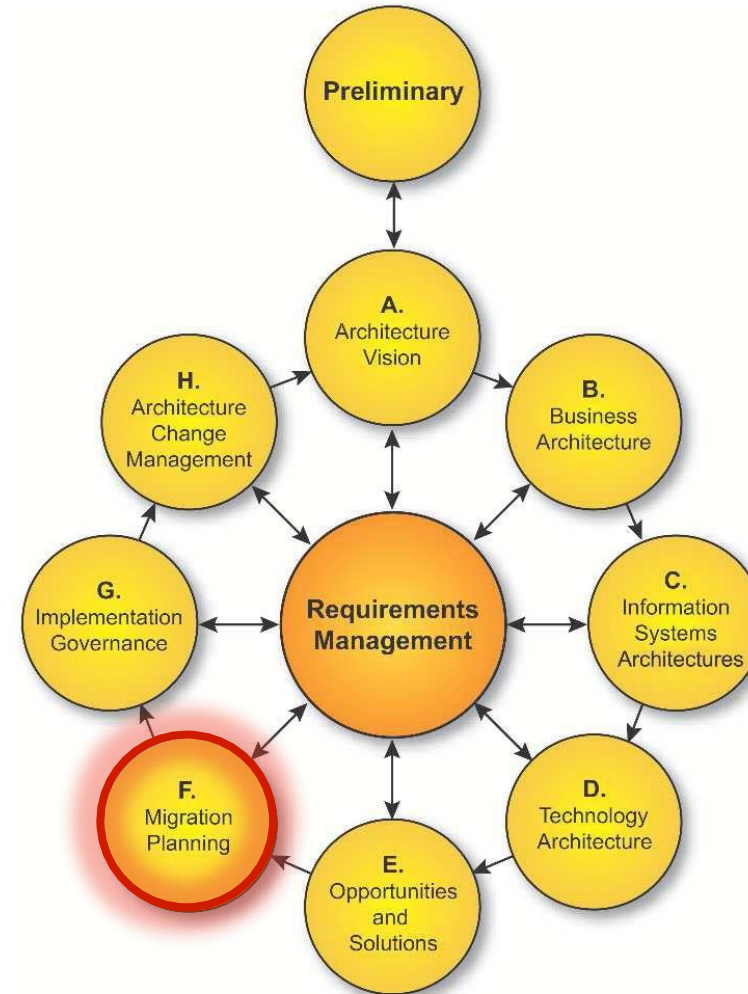

Includes the **identification of delivery packages** for the architecture defined in the previous phases

# Phase F: Migration Planning

Phase F addresses **how to move from the Baseline to the Target Architectures by finalizing a detailed Implementation and Migration Plan**

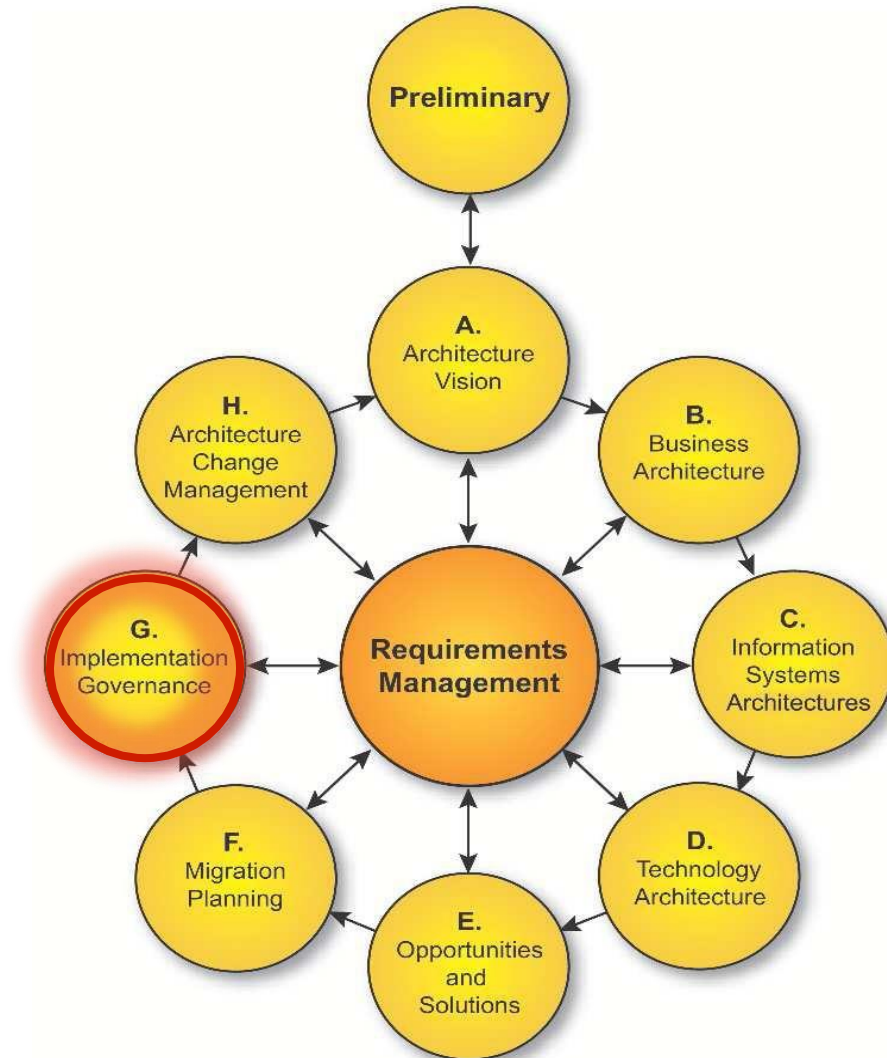

- PRIORITIZATION by cost / benefit

# Phase G: Implementation Governance

Phase G: provides an architectural oversight of the implementation

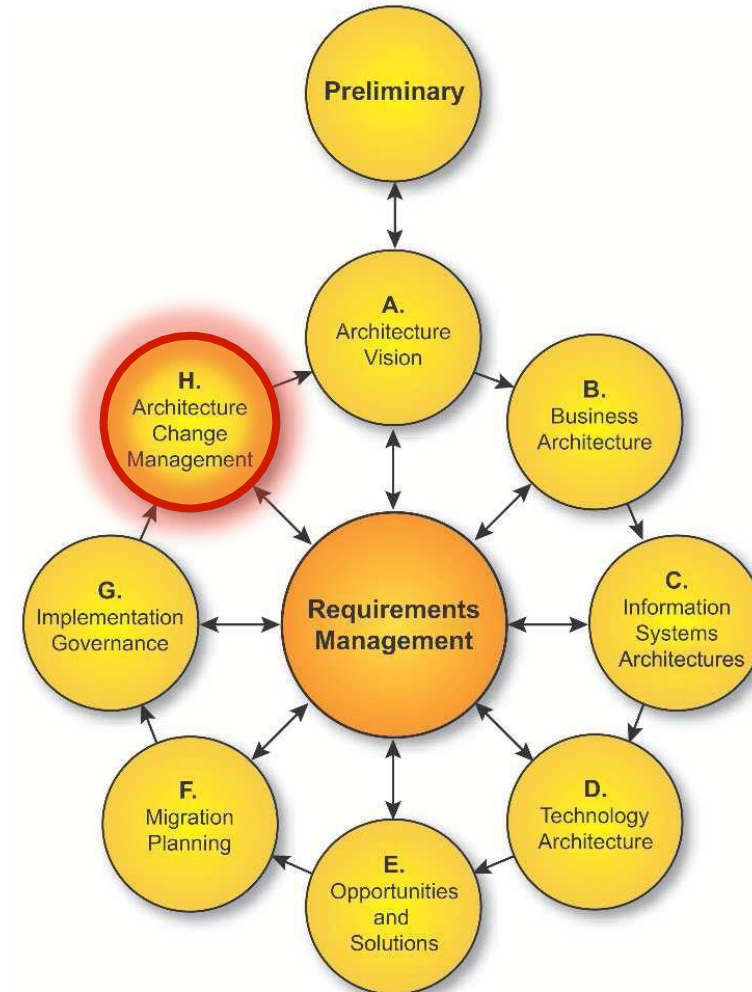

- CONTRACTS
- Compliance Review
- Handover for Solution Architects
- Project Recommendation
- Post-implementation review
- Risk management

# Phase H: Architecture Change

Phase H: Architecture Change Management establishes procedures for managing change to the new architecture

- Types of changes
  - Simplification change: via change management
  - Incremental change: via change management /partial re-architecting
  - Re-architecting change: via AMD

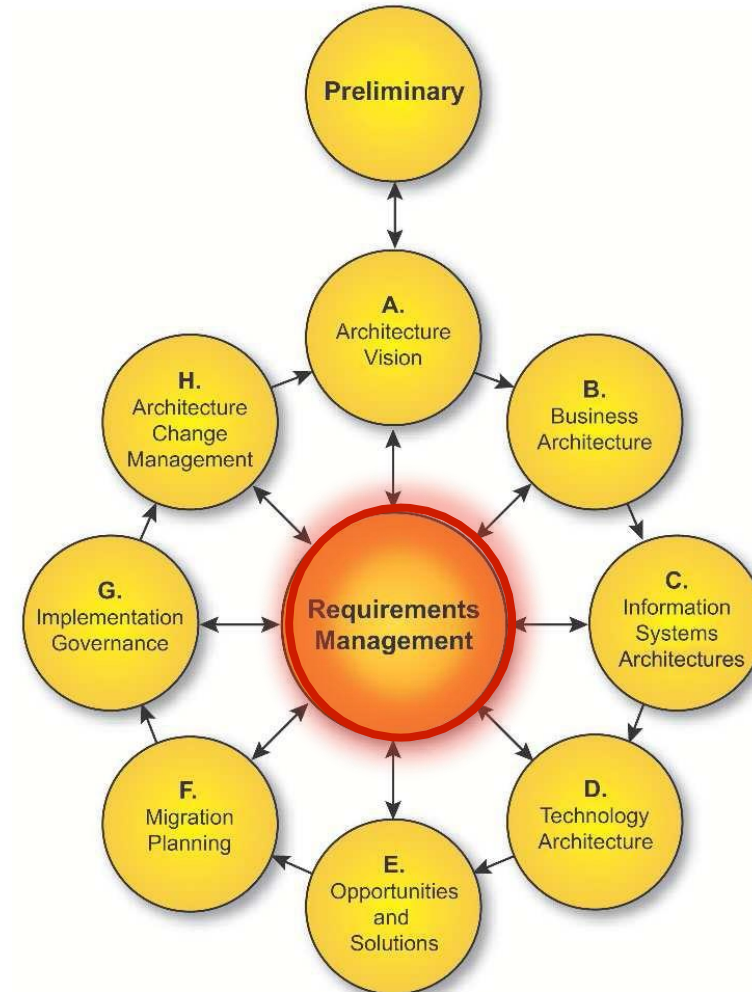

# Requirements Management

Requirements Management examines the process of managing architecture requirements throughout the ADM

- Prioritization of Requirements
- Changes requirement/priority → Request Impact Statement/Assessment

# Overview of the ADM

- **The ADM is a generic method:** It can be used by enterprises in a wide variety of different geographies, applied in different vertical sectors/ industry types and can be tailored to specific needs
- **The ADM is iterative:** Over the whole process, between phases, and within phases
- For each iteration of the ADM, a fresh decision must be taken as to:
  - The level of detail to be defined
- The architectural assets to be used:
  - Assets created in previous iterations of the ADM cycle within the enterprise
  - Assets available elsewhere in the industry (other frameworks, systems models, vertical industry models, etc.)
- To integrate the ADM with another enterprise framework
  - PRINCE2, ITIL, COBIT, CMMI, Zachman Framework

# Compliance levels

## Irrelevant:

The implementation has no features in common with the architecture specification (so the question of conformance does not arise).

## Consistent:

The implementation has some features in common with the architecture specification, and those common features are implemented in accordance with the specification. However, some features in the architecture specification are not implemented, and the implementation has other features that are not covered by the specification.

## Compliant:

Some features in the architecture specification are not implemented, but all features implemented are covered by the specification, and in accordance with it.

## Conformant:

All the features in the architecture specification are implemented in accordance with the specification, but some more features are implemented that are not in accordance with it.

## Fully Conformant:

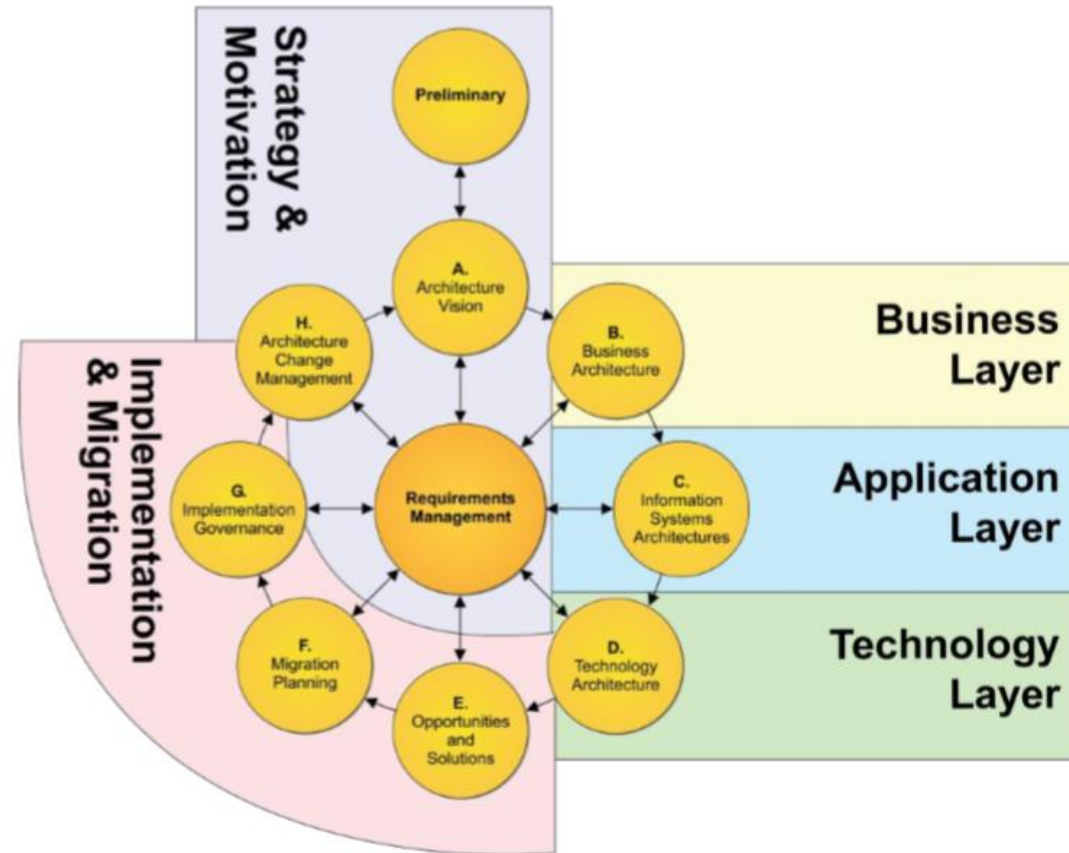

There is full correspondence between architecture specification and implementation. All specified features are implemented in accordance with the specification, and there are no features implemented that are not covered by the specification.

## Non-conformant:

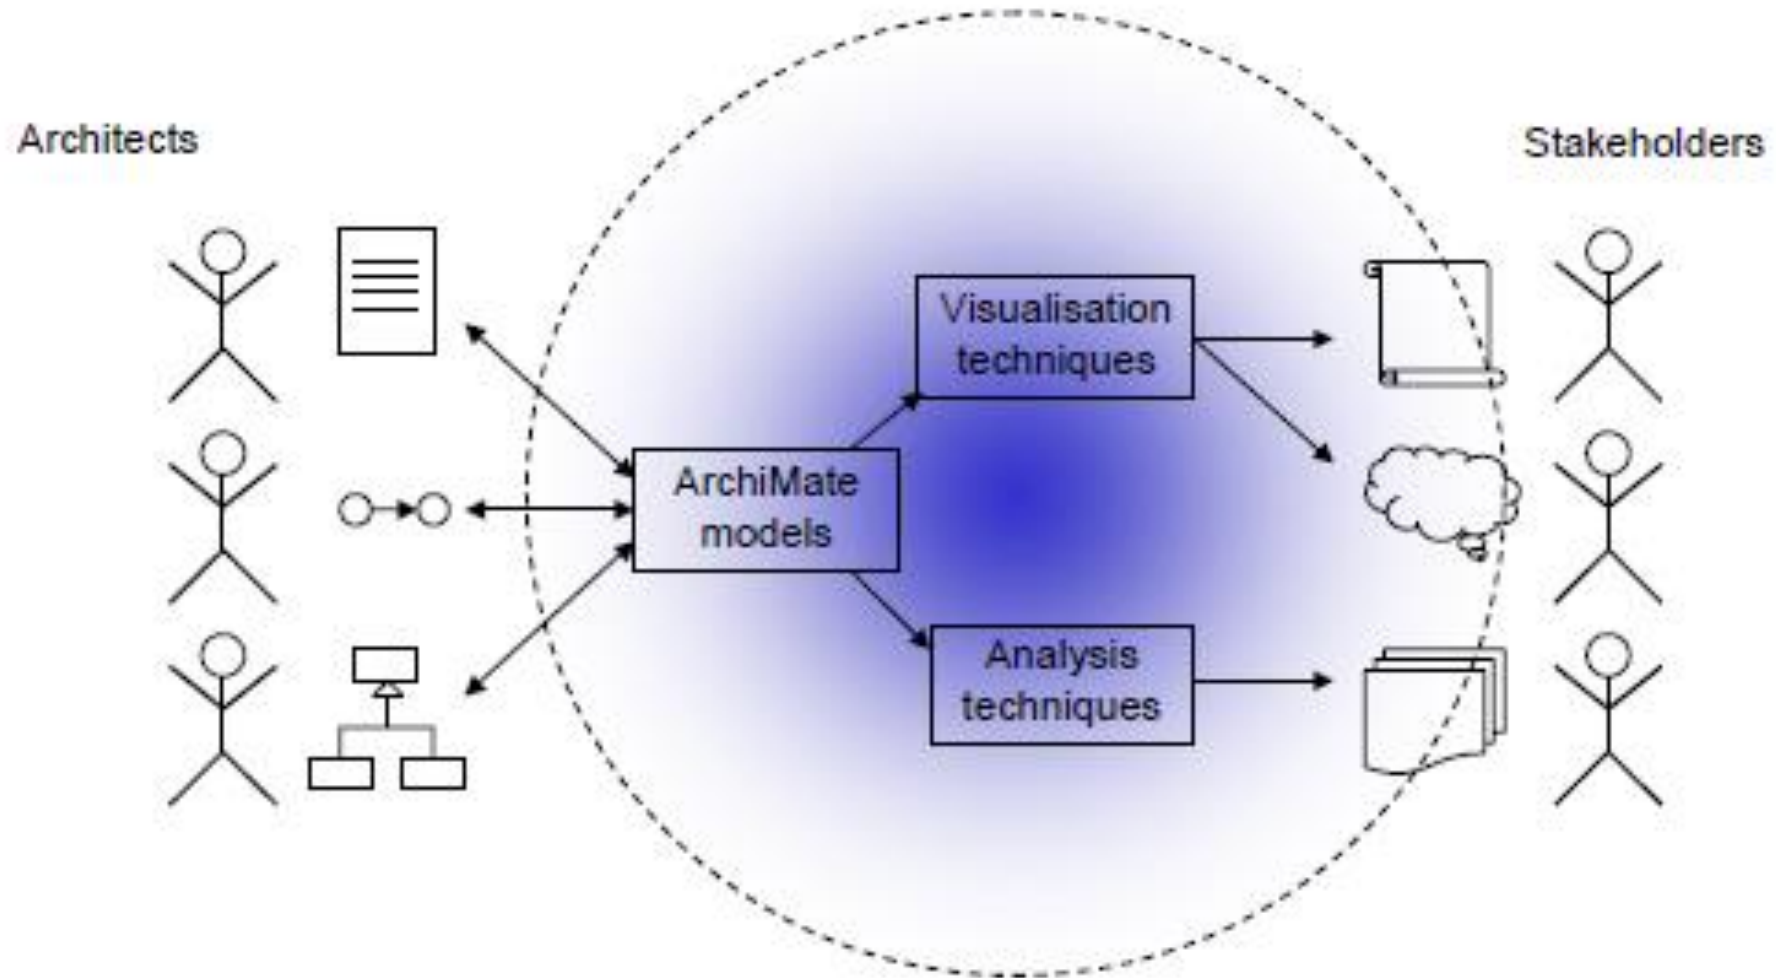

Any of the above in which some features in the architecture specification are implemented not in accordance with the specification.

# Correspondence between ArchiMate and TOGAF

The Relationship between the ArchiMate Language and the TOGAF ADM

# ArchiMate – why to use

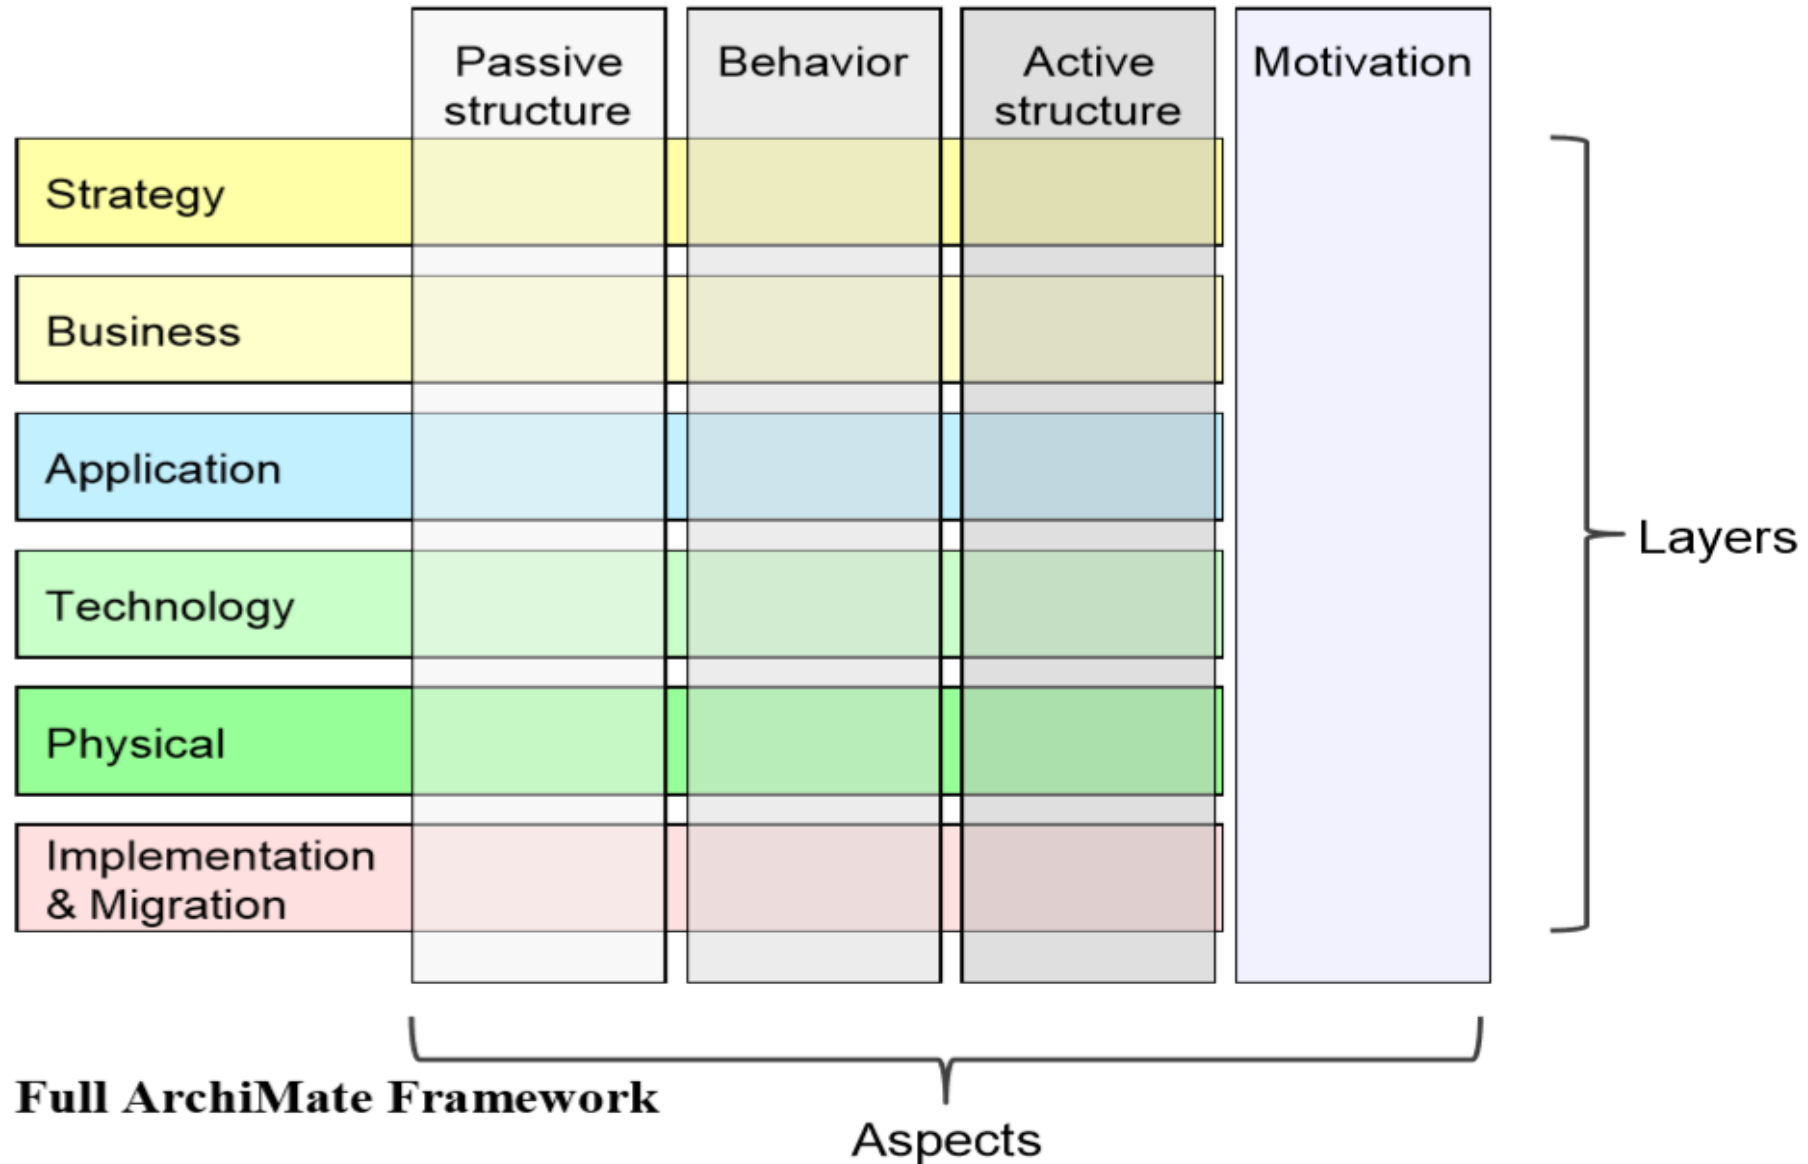

# ArchiMate framework

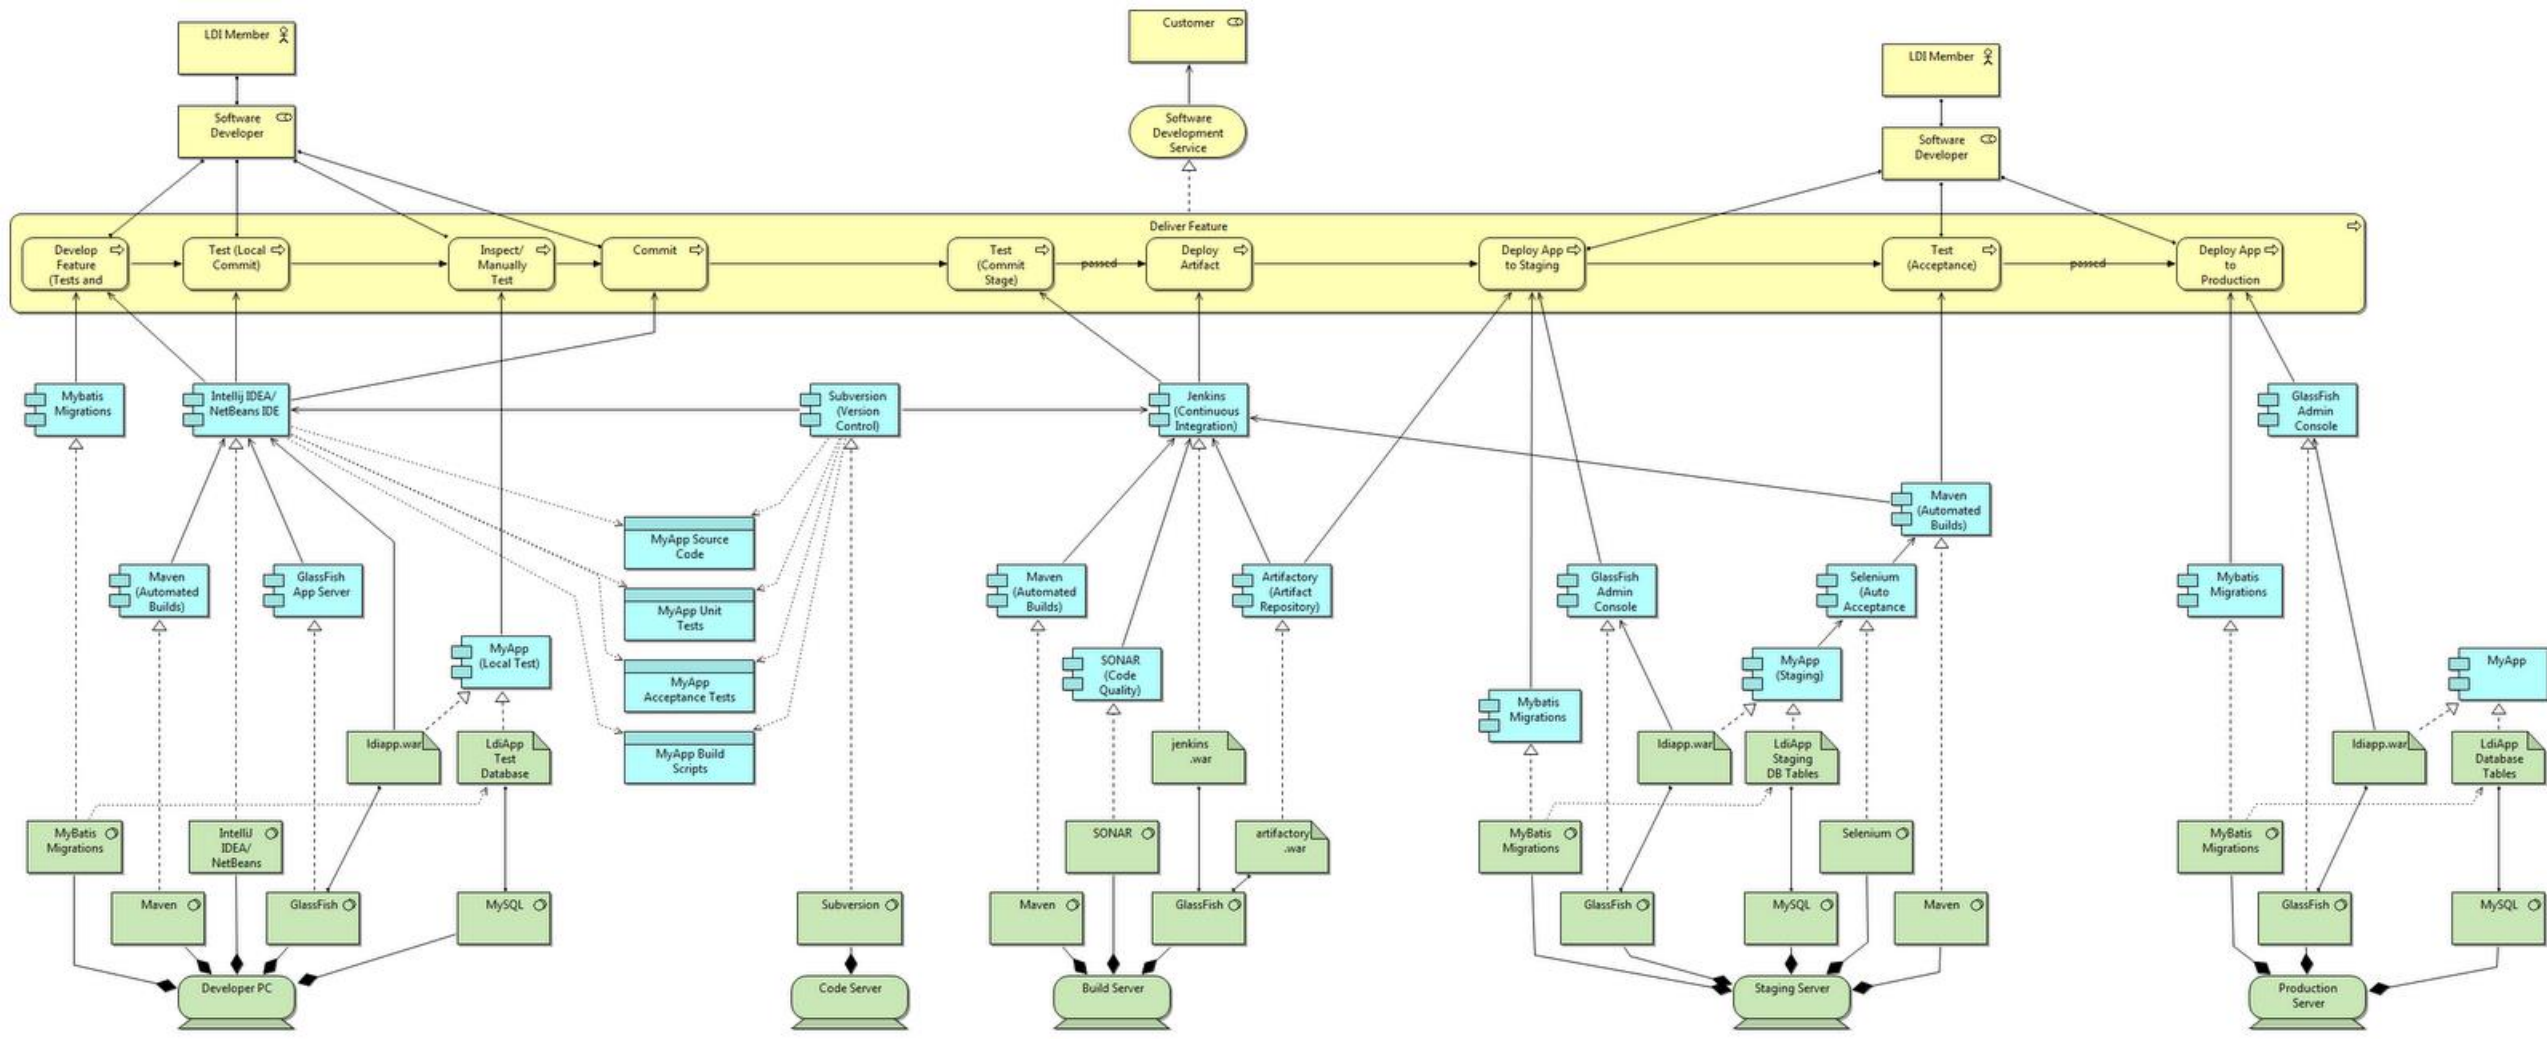

The dimensions of the framework are as follows:

- Layers: The three levels at which an enterprise can be modeled in the ArchiMate language Business, Application, and Technology (as described in Section 2.2).
- Aspects:
  - The *Active Structure aspect*, which represents the structural elements (the business actors, application components, and devices that display actual behavior; i.e., the “subjects” of activity).
  - The *Behavior aspect*, which represents the behavior (processes, functions, events, and services) performed by the actors. Structural elements are assigned to behavioral elements, to show who or what displays the behavior.
  - The *Passive Structure aspect*, which represents the objects on which behavior is performed. These are usually information objects in the Business Layer and data objects in the Application Layer, but they may also be used to represent physical objects.

# ArchiMate framework

# Archi – Open Source ArchiMate Modelling

- An open source modelling toolkit to create ArchiMate models and sketches. Used by thousands of Enterprise Architects throughout the world.
- The Archi® modelling toolkit is targeted toward all levels of Enterprise Architects and Modellers.
- It provides a low cost to entry solution to users who may be making their first steps in the ArchiMate modelling language, or who are looking for an open source, cross-platform ArchiMate modelling tool for their company or institution and wish to engage with the language within a TOGAF® or other Enterprise Architecture framework.

# Archi 4.3

- Multiplatform software for Enterprise Architecture modelling
- Download page: <https://www.archimatetool.com/download/>
