Dynamic models

Numerical methods for solution of differential equations

Euler iteration method

Differential equation: $\frac{dy}{dx} = f(x)$

Substituting of differentials by differences gives: $\frac{\Delta y}{\Delta x} = f(x)$

$$\frac{y_{(k+1)} - y_k}{x_{k+1} - x_k} = f(x_k) \quad \frac{y_{(k+1)} - y_k}{h} = f(x)$$

h is a step of iteration

It gives

$$y_{k+1} = y_k + h f(x_k)$$

The precision of the method depends on the magnitude of h

Example:

$$+\frac{dA}{dt} = 2k_2 B - 2k_1 A^2$$

$$+\frac{dB}{dt} = k_1 A^2 - k_2 B$$

$$k_1 = 300$$

$$k_2 = 0,15$$

$$A_{n+1} = A_n + 0,1 (2 k_2 B_n - 2 k_1 A_n^2)$$

$$B_{n+1} = B_n + 0,1 (k_1 A_n^2 - k_2 B_n)$$
