

3D CITY CARTOGRAPHIC MODELS

Temenoujka Bandrova

Department of Photogrammetry and Cartography
University of ACEG – Sofia

bandrova_fgs@uacg.bg

IN BRIEF

- Users of 3D maps
- 3D map – definition and content (main, secondary and additional cont.)
- “From Paper to Virtual Map” – a cheap technology for easy creation of 3D maps
- 3D cartographic symbol system
- Animation of 3D maps

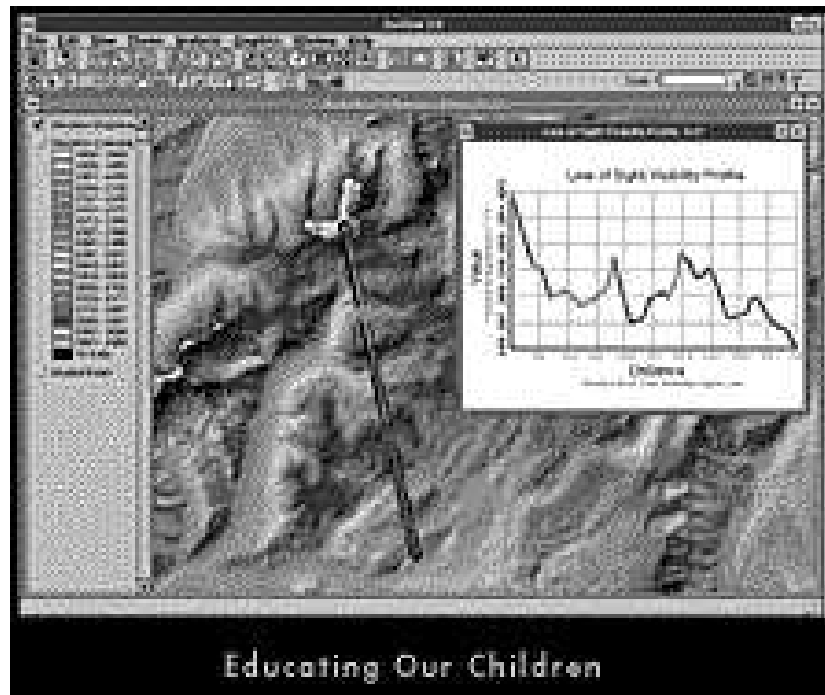

3D maps – USERS

- City planning and architecture

3D modelling of a part of Varna city in Bulgaria by DavGeo Ltd.

3D maps – created for different usage

- Education in schools and universities

3D maps – created for different usage

● **Land use**

3D modelling of a part of Varna city in Bulgaria by DavGeo Ltd.

3D maps – created for different usage

- **Land
management
and cadastre**

3D maps – created for different usage

- **Telecommunications**
- **Design and advertisement**

3D maps – created for different usage

- **Tourist offices**
- **Archives of City Architecture**

3D maps – created for different usage

- **Transport services**

3D maps – created for different usage

9-11 Damage Report - Lower Manhattan

- **Crises management**

3D model of New York (<http://www.metroblocks.com>)

3D maps – created for different usage

- **Police**
- **Military**
- **fire management**

3D maps – created for different usage

● **Meteorology**

3D maps – created for different usage

Institute of
Planetary Exploration  DLR

- **Environment pollution**
- **Water resources**
- **Flood mapping**
- **Crises management**
- **Risks Prevention Plans**
- **Long-term Monitoring**
- **Flood early warning**

3D model created by Institute of Planetary Exploration, DLR

map - definition

- **Maps – cartographic products represent the spatial variety of the natural and socio-economic phenomena.**
- **2 aspects:**
 - **mathematical – scale, map projections, coordinate system**
 - **geographical – visualize geo-information**

3D map - definition

- **Digital, mathematical defined, three-dimensional virtual representation of the Earth surface, objects and phenomena in nature and society.**

Represented objects and phenomena are classified, designed and visualised according to a particular purpose.

Disadvantages of 3D maps

- **Higher hardware and software requirements**
- **Difficulties in 3rd coordinate collection**
- **Large amounts of data and complex visualization**
- **Lack of standardized symbol system**
- **High 3D production price**

Advantages of 3D maps

- **Multiple geometric representation**
- **High realistic representation of the real world**
- **Photo-realistic buildings and objects representation**
- **User friendly and easy for understanding models**
- **Attractive and more informatively products**
- **More applications and users**

Contents of 3D maps

- **Main content**
- **Secondary content**
- **Additional content**

Main content

- large topographic or landscape objects – relief bodies
- roads
- buildings

Secondary content

- traffic signs
- facilities
- transport elements
- information signs
- trees
- geodetic points

3D map “a street in Vienna”, created by ICG, TU Graz and 3D symbols created by T. Bandrova

Additional content

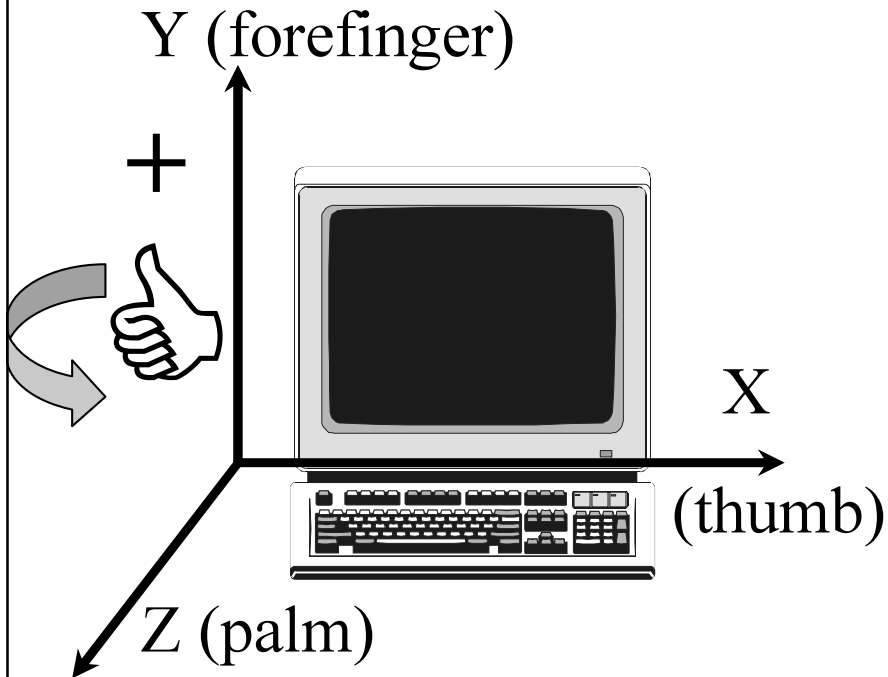

- **quality and quantity information about objects**
– fence, roof, street, parcel
- **created as a textural database**

Sources for 3D map

- paper topographic or cadastral maps
- photogrammetric or surveying data
- digital 2D map
- topographic information, measurements, architecture drawings etc.
- digital or paper photos
- 3D symbol system

Mathematical basis

- **Scale – source 2D paper or digital map**
- **2D view in “top”, “front”, “left”, ...**
- **Perspective projection**
- **Spatial orthogonal 3D coordinate system XYZ (local)**

Standard Primitives

Object Type

AutoGrid

Box	Cone
Sphere	GeoSphere
Cylinder	Tube
Torus	Pyramid
Teapot	Plane

Name and Color

Color selection area

< 0:8:16 / 1:30:0 >

None Selected

Grid = 10,0cm

Animate

0:8:16

Click and drag to pan a non-camera view

Code	Name of type object object	Classification of mapping objects
1000	Situation	<p data-bbox="1431 371 1951 751">The basic types, kinds and sub-kinds objects - hierarchy-code presentation</p> <p data-bbox="1431 930 1861 1225">European standards for exchange of information</p>
1100	Geodetic base	
1110	Astronomic point	
1120	Triangulation point	
1130	Polygon point (PP)	
1131	PP, stabilized by a wooden picket	
1132	PP, stabilized by a concrete block	
1133	PP, stabilized by an iron tube	
1140	Axis point	

1500	Transport objects	
1510	Railway	
1520	Roads	
1521	Highway	

1527	Shaped pathway	

2000	Hydrographic objects	

3000	Relief	

4000	Pipelines	
---	...	

Generalization

Automatic – formal selection, smooth and filtration, according formal criteria

Dynamic – for animation presentation and track out the development of the phenomena in the space and time

Interactive – complex of the traditional, automatic and time generalization

Accuracy in objects representation

Accuracy in reference (location)

Thematic accuracy

Semantic accuracy

Accuracy in object location

- accuracy of measurements and data capture
- scale of 2D map
- method of sources processing

Thematic accuracy

- data base – quality of statistical data, methods of capture and processing**
- data transformation – selection, classification and data references**

Semantic accuracy

- **symbols define the objects**
- **realistic and informatively representations**

Photo-texturing

Photos from street level – for buildings facades

Photo-texturing

textures after image processing

Texturing

Software library texturing - areas symbols

Grass

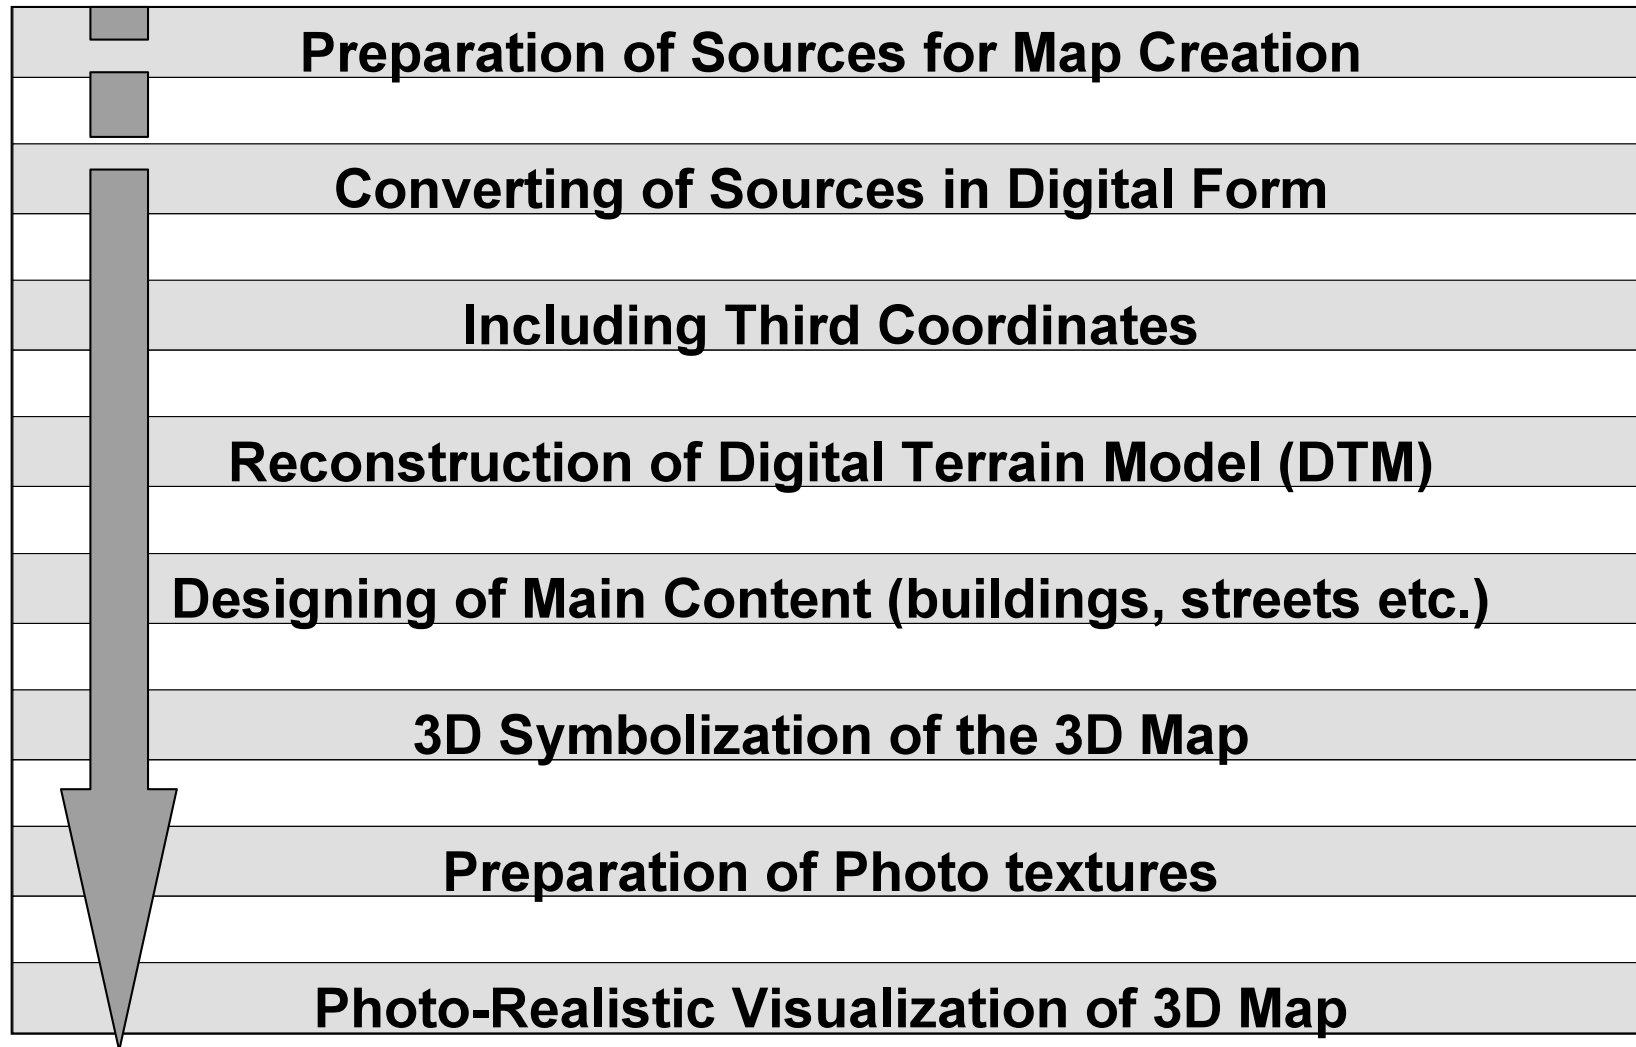

Pavements

Roads

A technology for designing of 3D maps

3D maps on 2D monitor?

This disadvantage is overtaken by applying of various “tricks” just in order to leave the user with no doubt that it is really a 3D model. This can be enriched by assigning to the objects of properties of the real objects and materials, such as luminosity, roughness, transparency, lighting, shadow. 3D maps become more realistic like in the real world.

Quality of visualizing of 3D maps

- 1. Real color tone of screen points**
- 2. Good contrast and focus**
- 3. Maximum possibility for brightness usage and keeping of good contrast**
- 4. Grey linear scale (proportional brightness levels)**
- 5. Quality of the white color**
- 6. Monitor's flicker and twinkle**

Steps for symbol creation

1. gathering information for an object;
2. analyzing information and collecting data for each object;
3. designing symbols by visual and metric analysis applying computer graphics techniques;
4. visualizing symbols in virtual environment;
5. obtaining synthesized information for an object.

3D map Central Sofia

43 buildings,
streets,
pavements, grass
areas, symbol
system;

24 photos,
scanning with 300
dpi, в RGB (Type:
Sharp Millions of
Color, Brightness:
125, Contrast: 132)

5 photo-textured
buildings

3D map - Vienna

3D model of 28 buildings

GIS data

Aero-photos and photos of buildings' facades, made from street level

Scanning of 200 traffic signs for texture processing

Conclusions

- Creation of a symbol system will facilitate the compilers as well as users of 3D maps.
- Their existing will legalize the 3D maps and this is the task of cartography in nowadays.
- The next step - researches of the qualitative and quantitative features of the map by 3D GIS, extraction of the data for it and solving of different kind of tasks.

**Thank you very much
for your attention!**
