

**G7481**

# **Magnetometry in geology and archaeology**

**Lecturer: Vojtěch Šešulka**

spring 2010

# Geophysical methods

---

- magnetometry
- gravimetry
- seismic
- geoelectric
- georadar
- geothermic

# Magnetic method

of geophysical survey

- principal: measuring the Earth's magnetic field and its anomalies
- observed units:
  - total magnetic field T [nT]
  - magnetic field gradient [nT/m]
  - magnetic susceptibility  $\times 10^{-4}$

# Cesium magnetometer

SM-5 Navmag (Scintrex, Kanada)

# Modes of measurements

- gradiometer  
(magnetic field gradient  $\Delta T$  [nT/m])
- variometer  
(total magnetic field  $T$  [nT] )

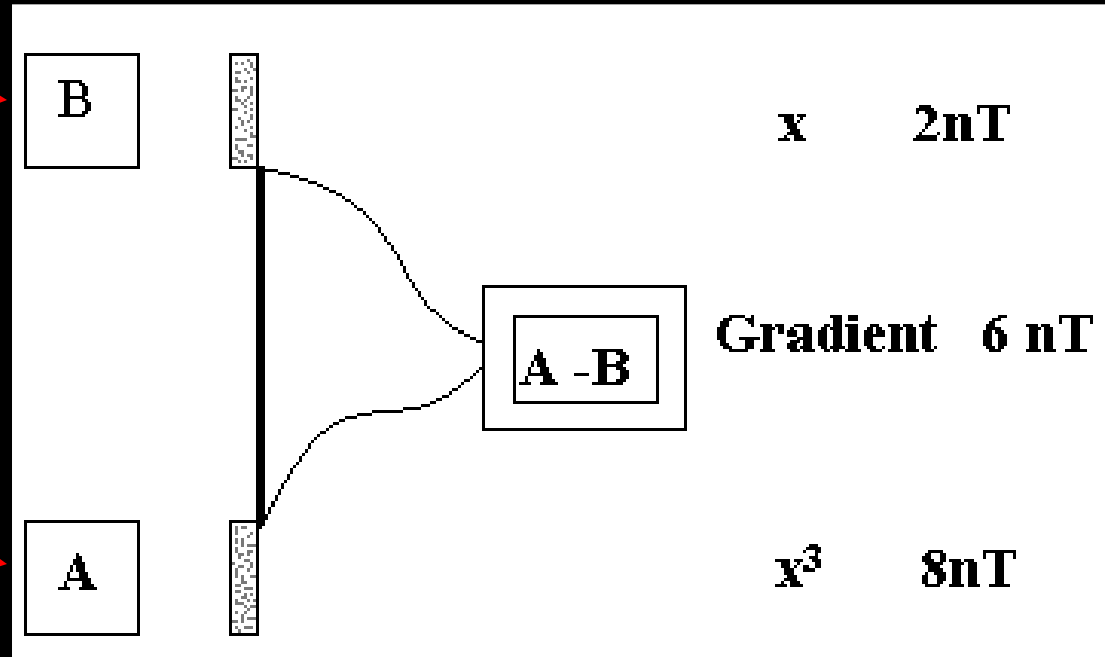

*Proton magnetometer PMG-1 fa  
in gradient mode,  
Geofyzika Brno*

# Gradiometer

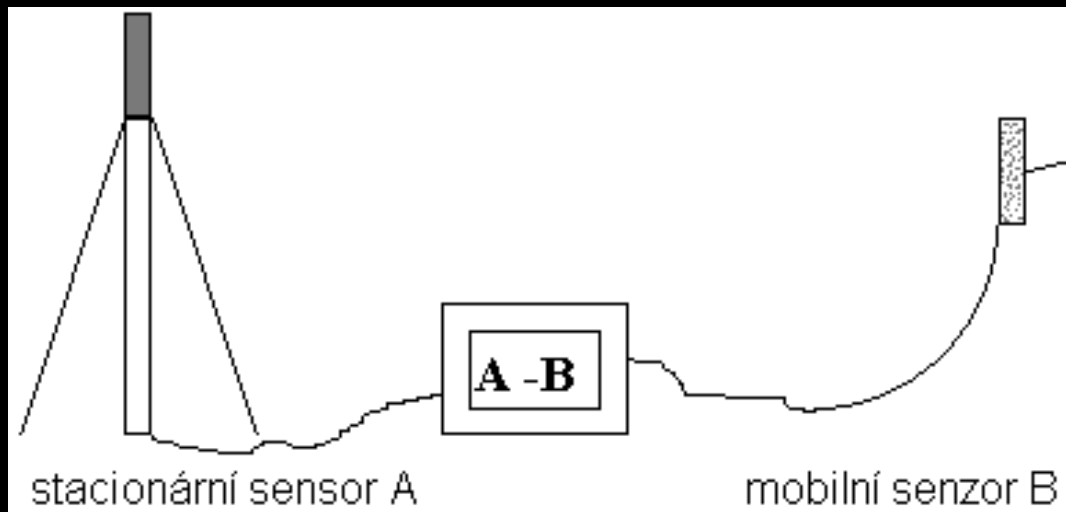

- two vertically placed sensors
- prevents the magnetic field variations error
- better for shallow objects and structures

# Variometer

- data collected with only one sensor
- Earth's magnetic field variations error → necessity of correction

# Application

of magnetic method

- geological structures mapping
- mapping buried ferrous metal objects and other buried structures

# Magnetometry

in archaeology

- suitable:
  - countersunk objects
  - fireplaces, ovens, furnaces, ...
  - line objects (ramparts, trenches, palisades, ...)
  - identification of metal objects
  - detection of landfills and terrain formations
- less suitable:
  - communications
  - stone-made object (if is used the stone from the bedrock of the site)

# Measurements types

---

- testing measurements  
(suitability of the method)
- areal measurements  
(several days long measurements)
- detail measurements  
(the most interesting objects)

# Presumption

of successful project

- physical contrast between the object and surroundings
- good state of objects insitu
- size, shape, orientation and count of objects
- relief and vegetation
- absence of structures, which are not in our interest
- climatic conditions during the measurement
- suitable combination of several geophysical methods

# Magnetic method

of the geophysical survey

- the measurement runs in squares (often 50×50 m)
- suitable profiles orientation to the measured structure (best in N-S direction)
- density of recorded data up to 0,5×0,15 m (depend on our interest)

# Magnetic method

field work

# Magnetic method
