

# Ultrafialová a viditelná spetroskopie

Materiál k předmětu

C 6390 Fyzikální metody organické chemie – laboratorní cvičení

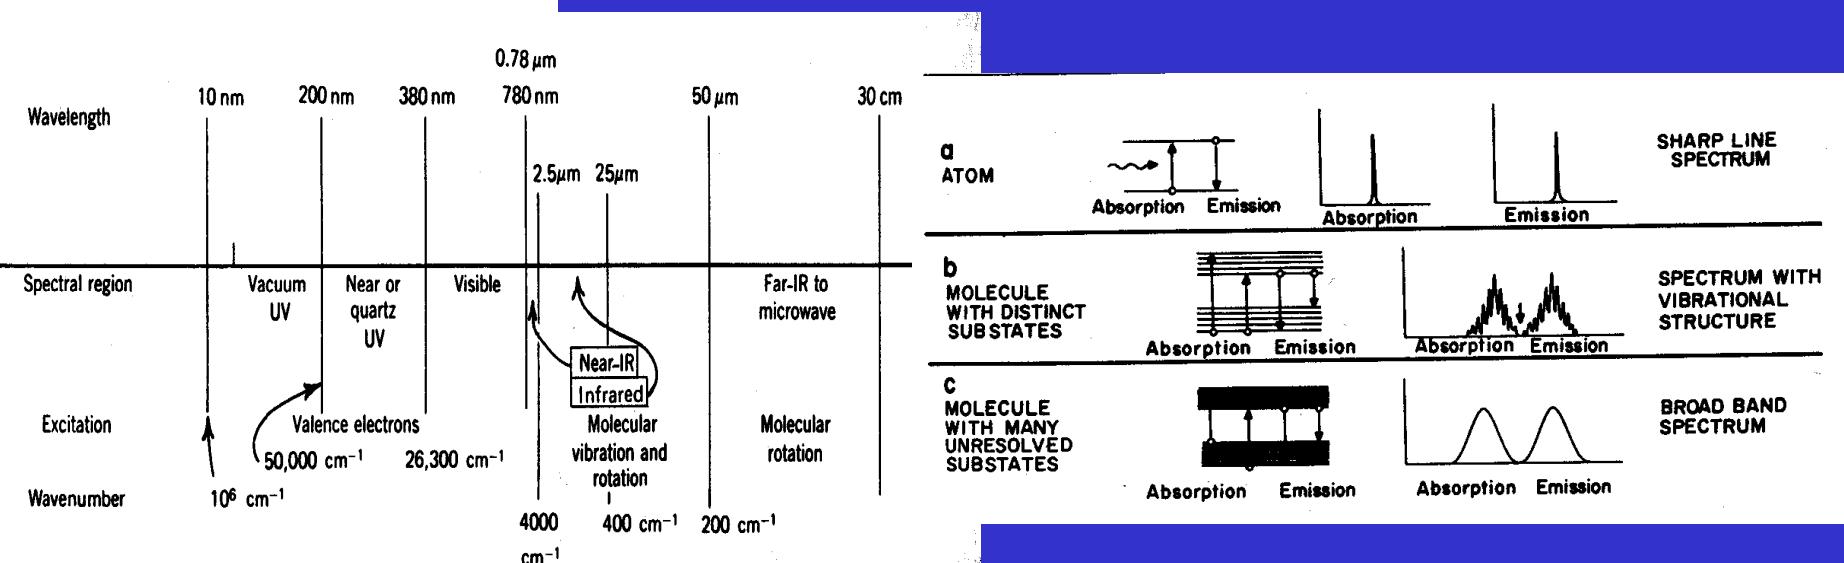

# Co měří UV-VIS spektroskopie? fyzikální podstata

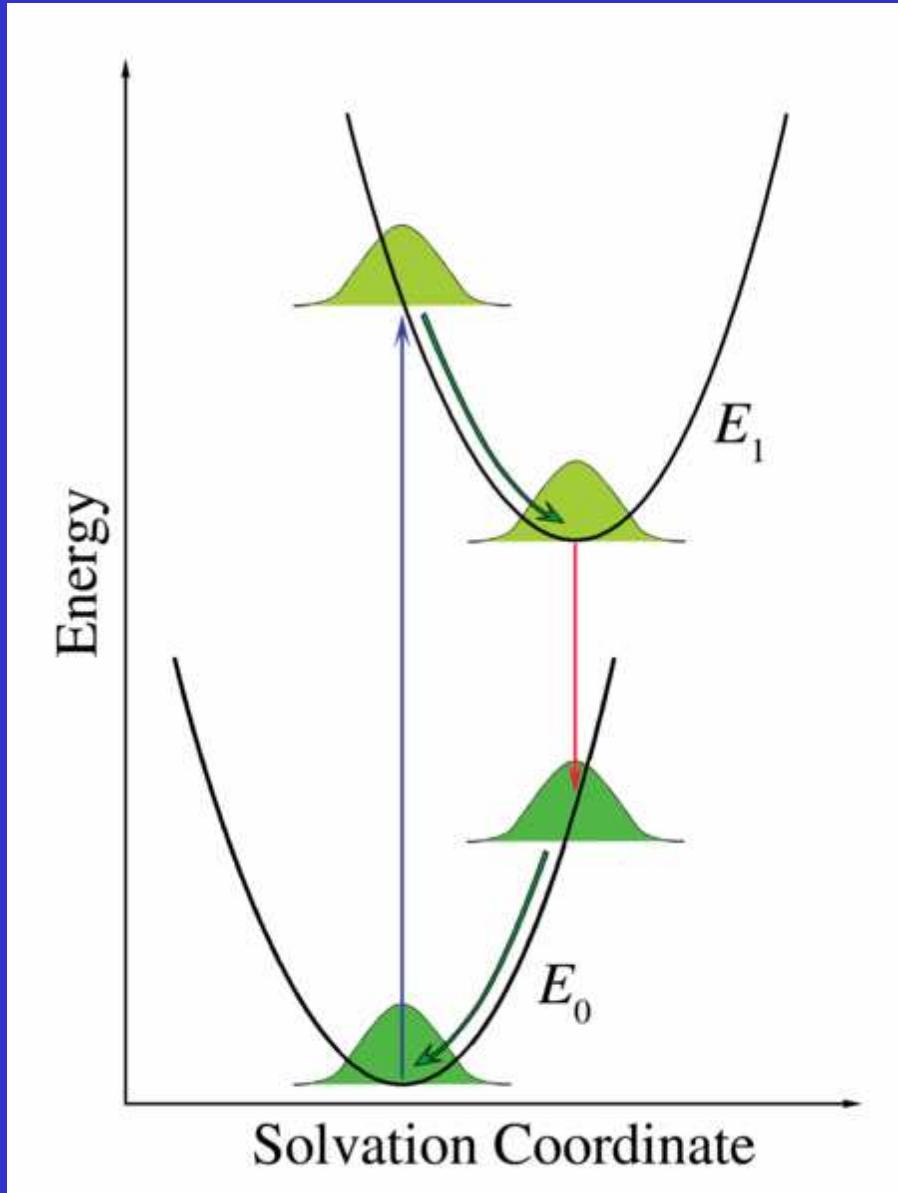

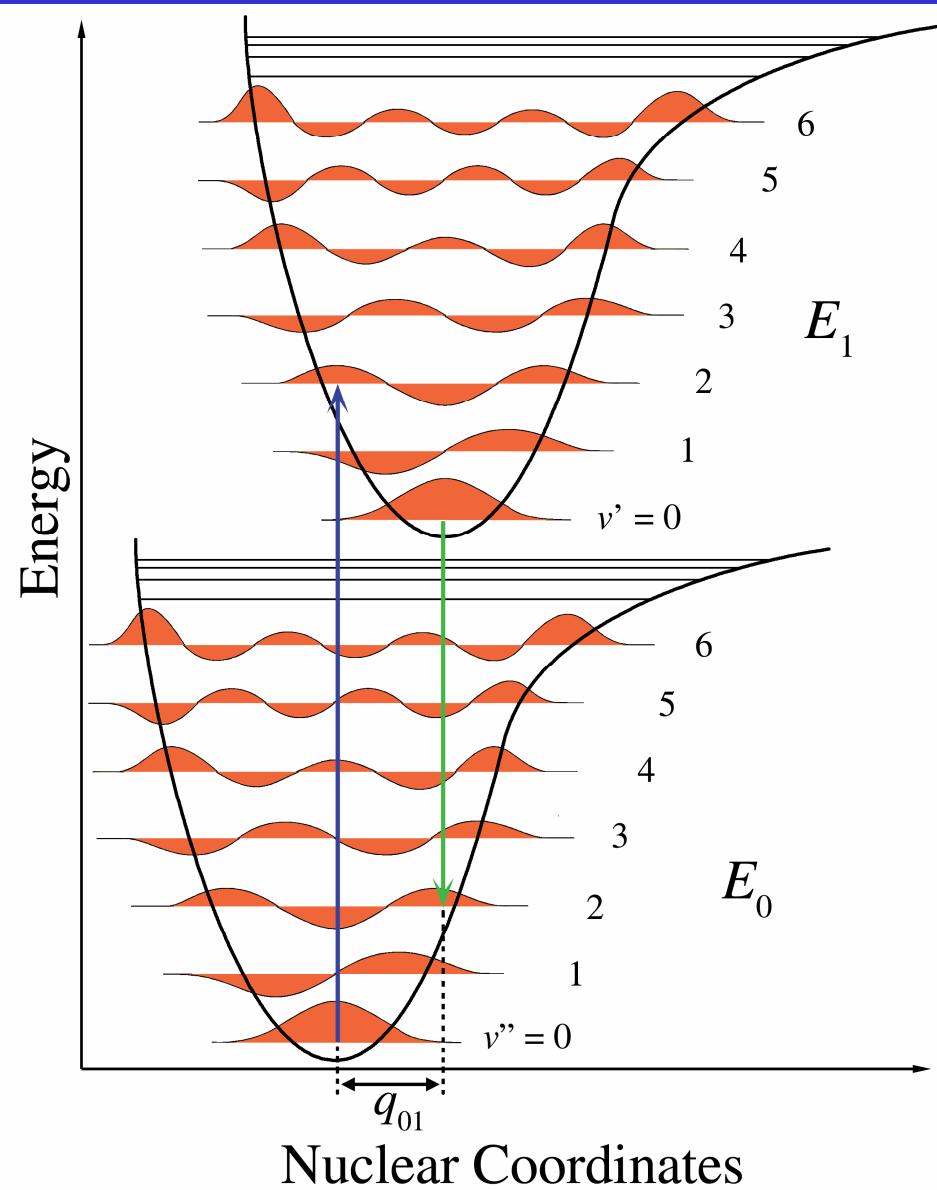

$\lambda / \text{nm}$	
185 - 200	Vacuum-UV
200 – 380	Near-UV (quartz)
380 – 780	Visible

$$E_{\text{int}} = E_{\text{el}} + E_{\text{vib}} + E_{\text{rot}}$$

# Franck-Condon Principle

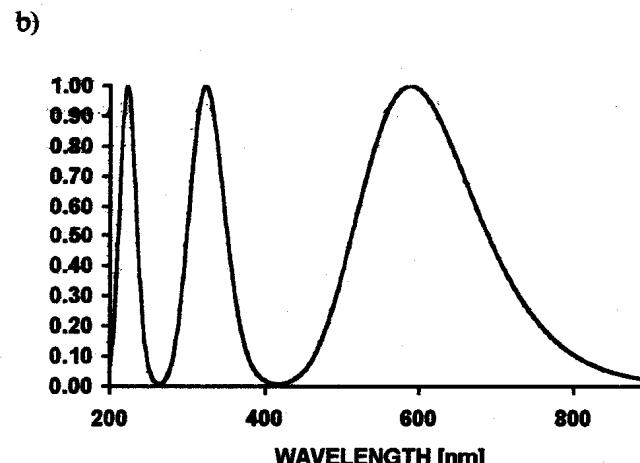

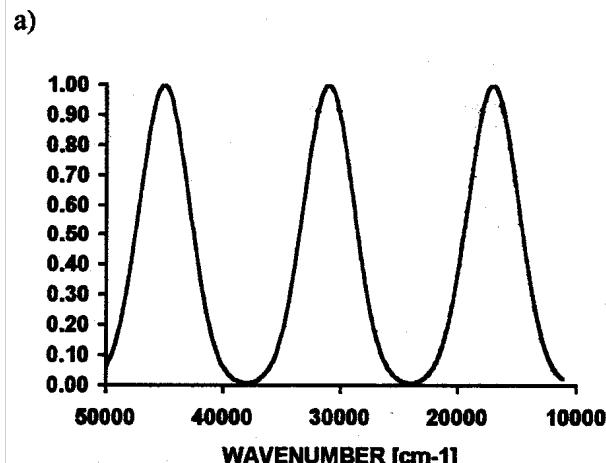

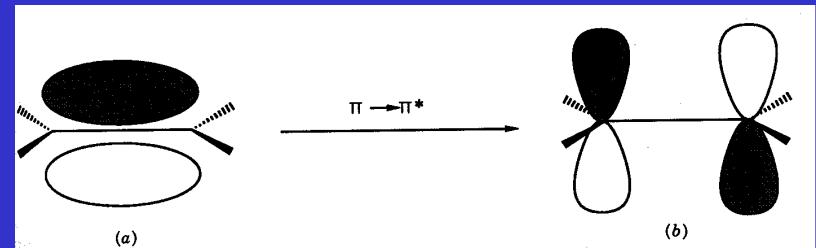

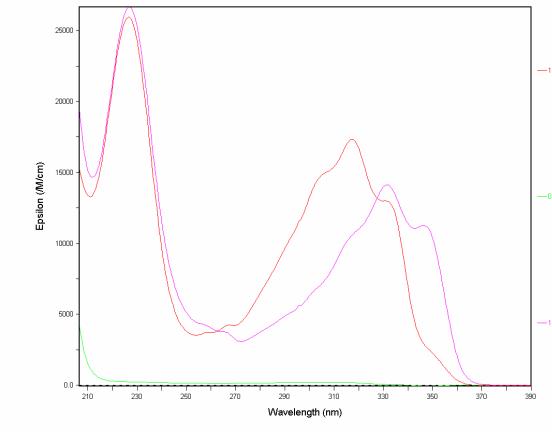

# Spektrum

$$x \sim E \sim \tilde{\nu} \sim 1/\lambda$$

y ~ intenzita ~ pravděpodobnost přechodu → síla oscilátoru

$$f \equiv 4.3 \text{e-9} \int \varepsilon d\tilde{\nu} \sim 4.3 \text{e-9} \varepsilon_{\max} \Delta\tilde{\nu}^{-1/2}$$

$$E = h\nu = hc/\lambda = hc\tilde{\nu}$$

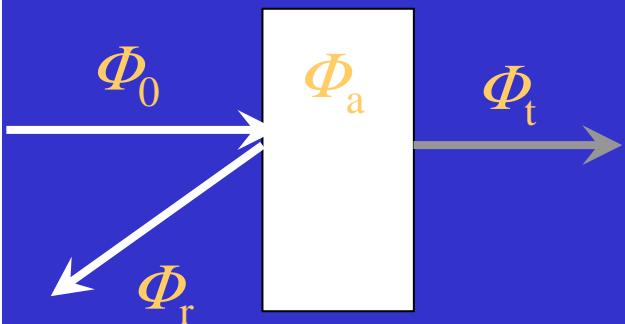

# Beer – Lambert – Bouguer law

$$-\log \Phi_t/\Phi_0 = -\log \tau_i = \epsilon cb = A$$

$$\tau_i = \Phi_t/\Phi_0 \quad \text{vnitřní transmitance (transimisní faktor)}$$

$$\rho = \Phi_r/\Phi_0 \quad \text{reflektance, reflexní faktor}$$

$$\alpha = \Phi_a/\Phi_0 = 1 - \tau \quad \text{absorptance, absorpcní faktor}$$

Veličina	Symbol	Jednotka
monochromatický zářivý tok	$\Phi$	W
(dekadická) vnitřní absorbance	$A$	1
molární (dekadický) absorpční koeficient	$\epsilon$	L mol <sup>-1</sup> cm <sup>-1</sup>
absorpční dráha	$b$	cm <sup>-1</sup>
optická dráha kyvety	$l$	cm <sub>5</sub> <sup>-1</sup>

# Jednopaprskový UV – vis spektrometr

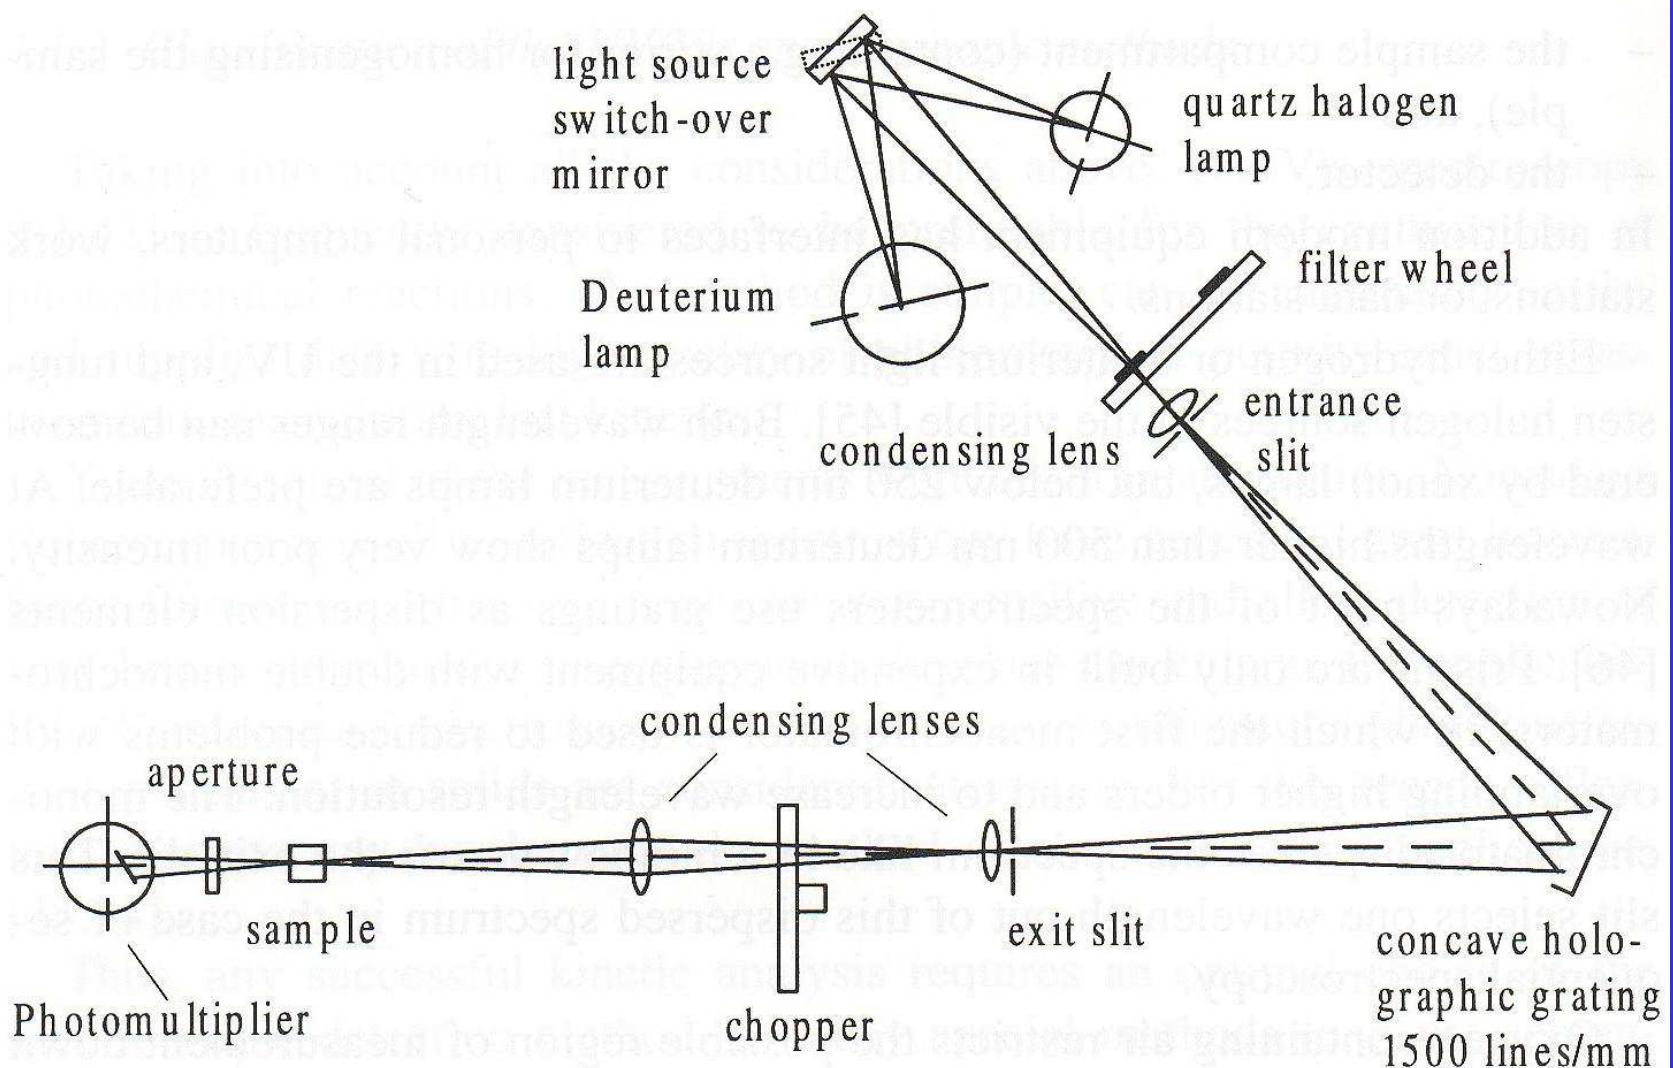

Fig. 4.1. Optical geometry of a single beam instrument, the Uvikon 710 by Kontron Instruments, Eching.

# Dvoupaprskový UV – vis spektrometr

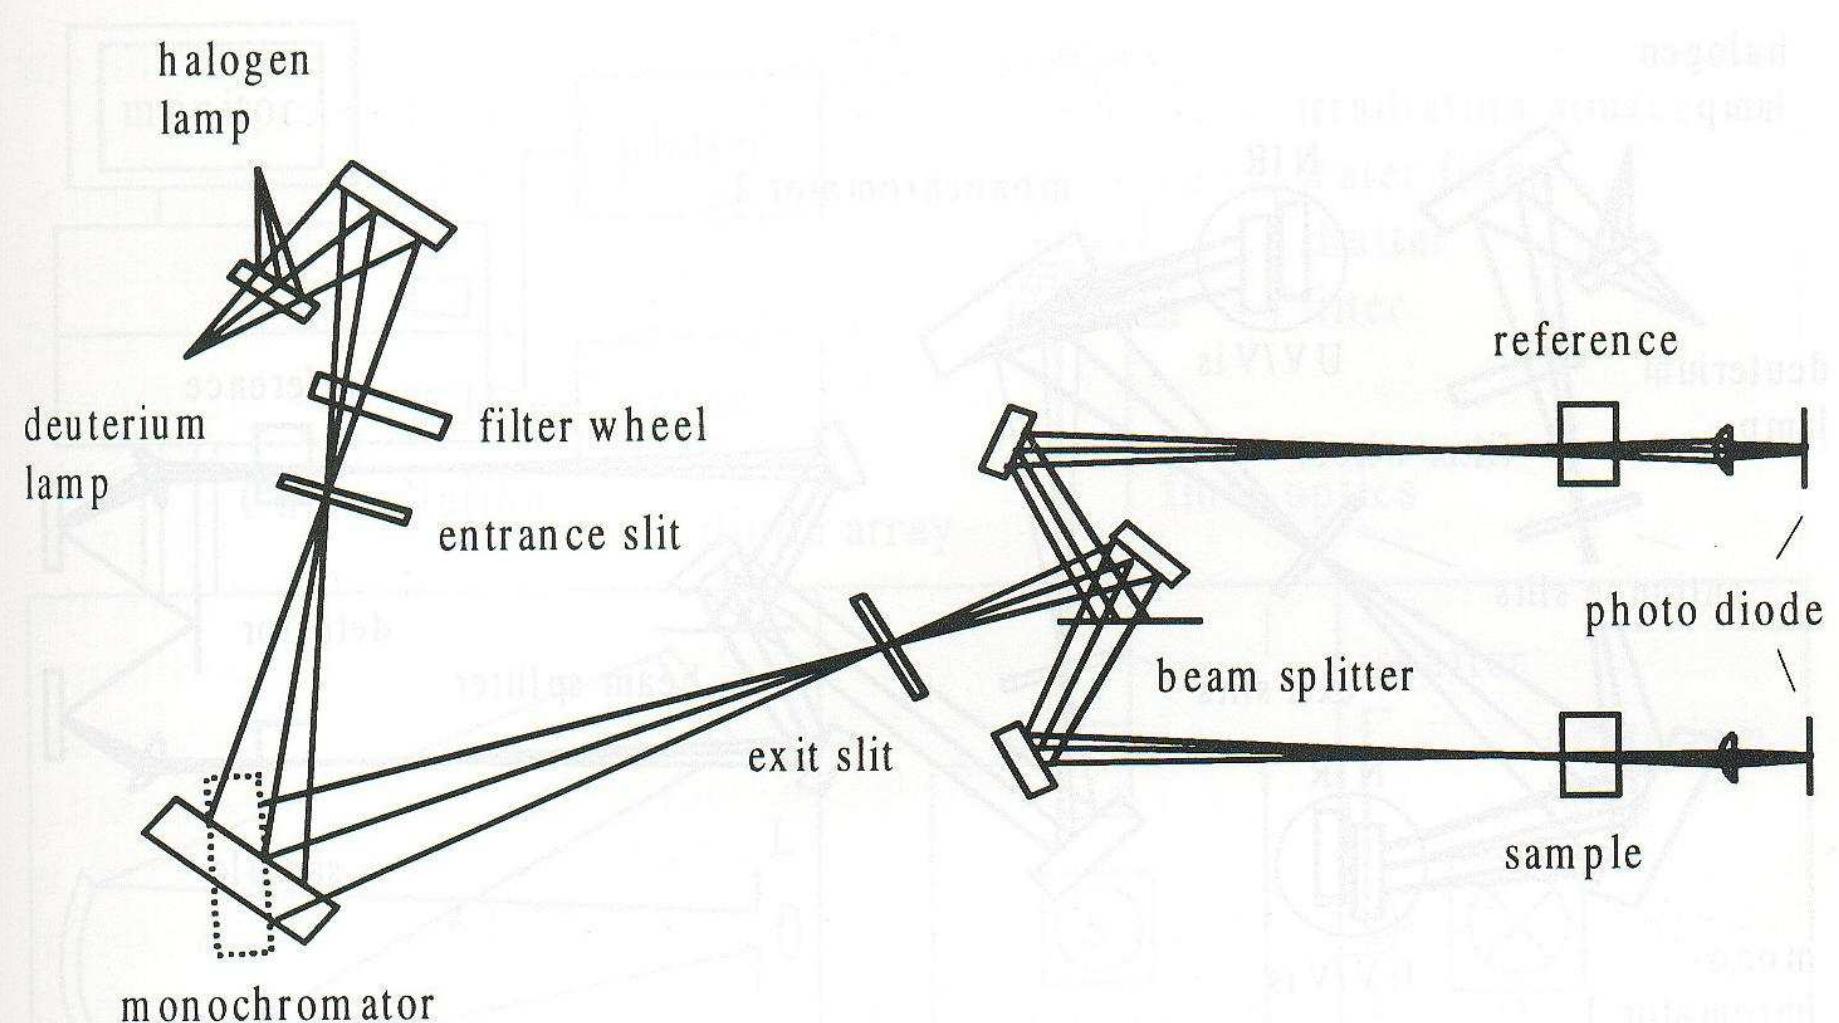

Fig. 4.2. Schematic diagram of the optical pathway in a double beam instrument Lambda 2,  
Perkin Elmer, Überlingen.

# Dvoupaprskový, dvoumřížkový UV – vis spektrometr

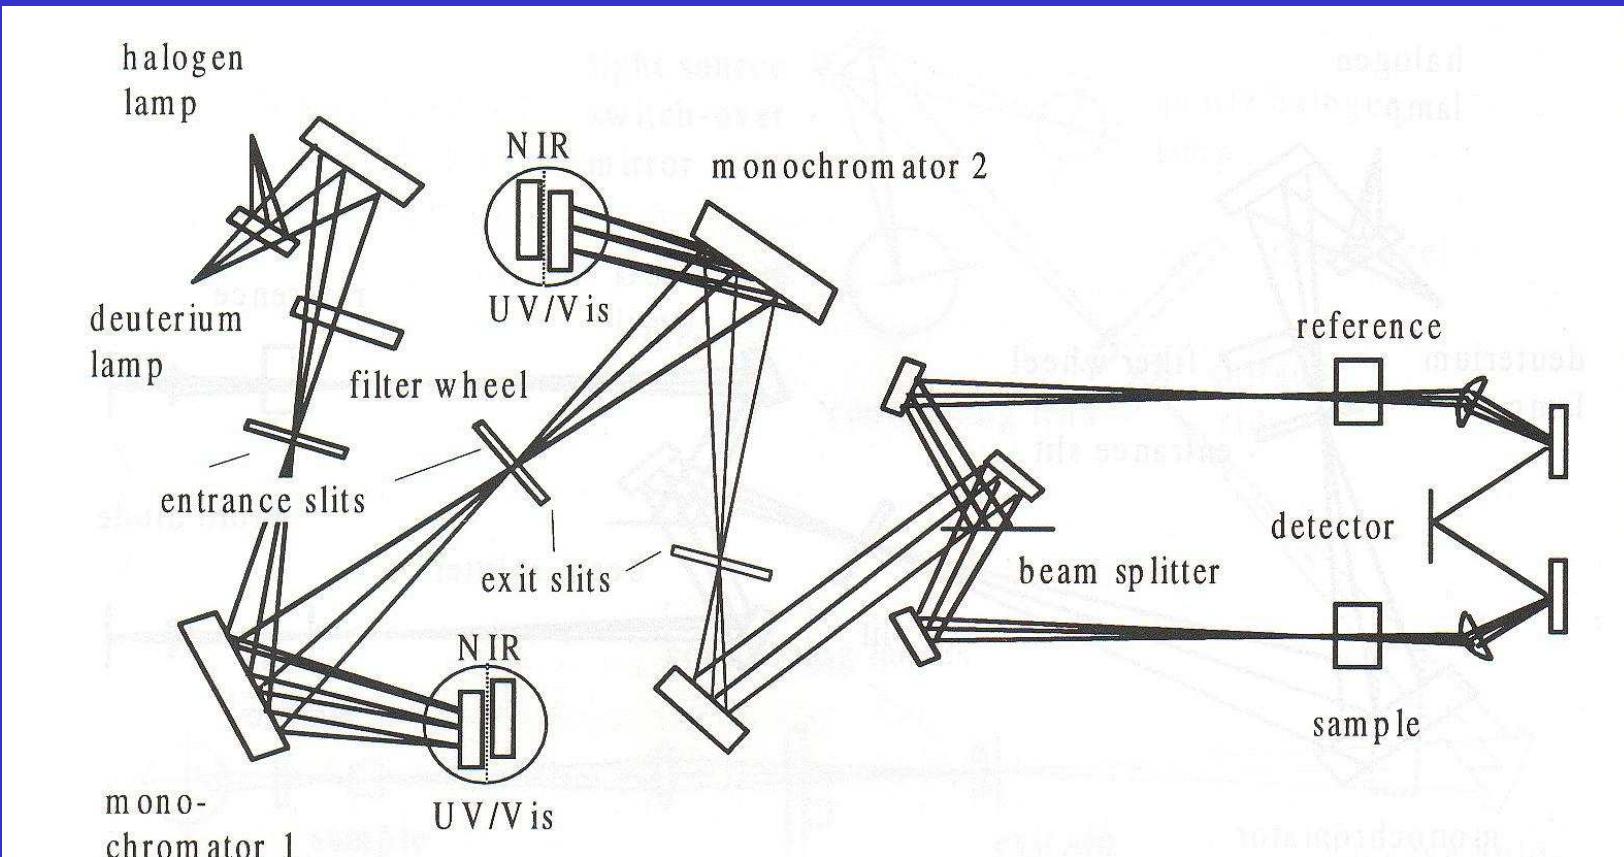

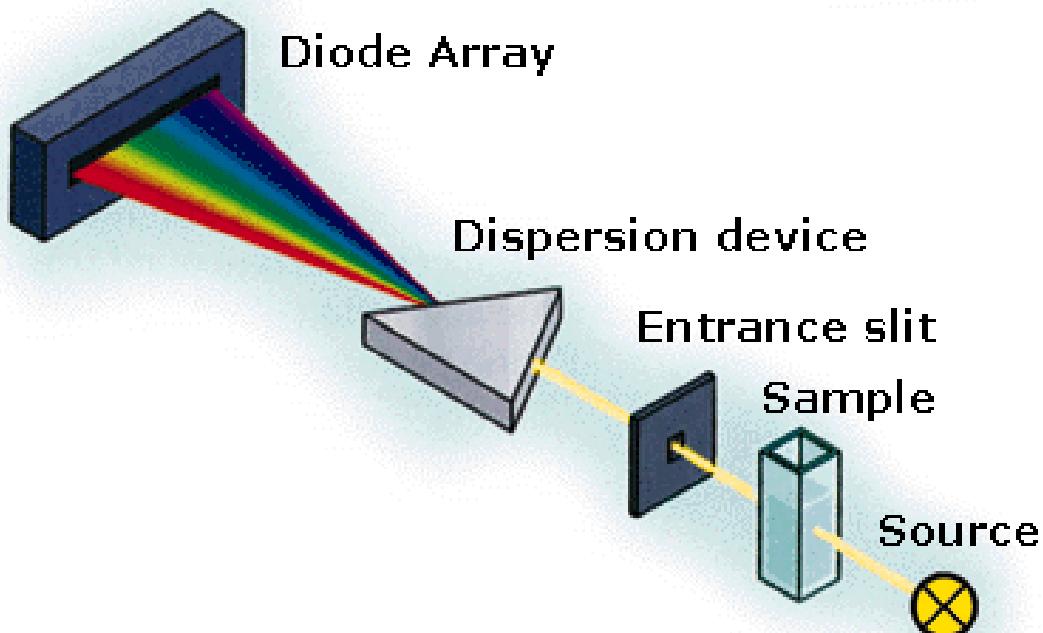

Fig. 4.3. Double beam set-up with a double monochromator for very precise photometric measurements and the possibility of taking high resolution spectra (Lambda 9, Perkin Elmer, Überlingen). This instrument covers the wavelength range from the UV until the near infrared (NIR).

# Jednopaprskový UV – vis spektrometr s diodovým polem

# UV – vis spektrometr

## Zdroj

- čarový x spojity
- rtuťová-halogenová výbojka <330; 1200> nm
- D<sub>2</sub> lampa <UV; 330> nm
- Xe výbojka <190; 1000> nm

## Spektrometr

- jednopaprskový x dvoupaprskový
- sekvenční x simultální

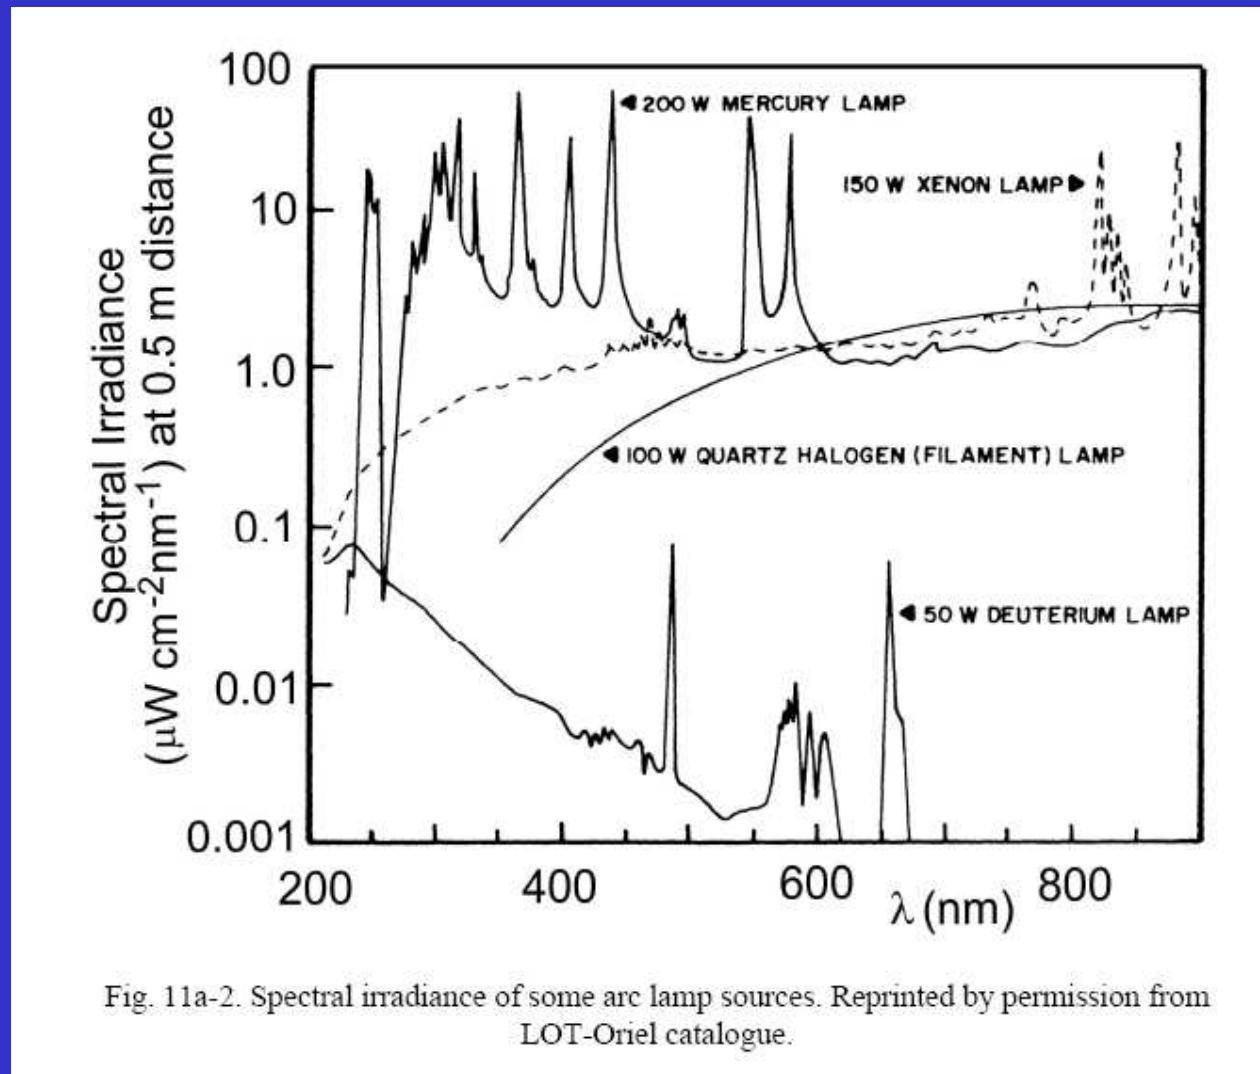

## Detektory

## Kvety

- tvar
- objem
- materiál

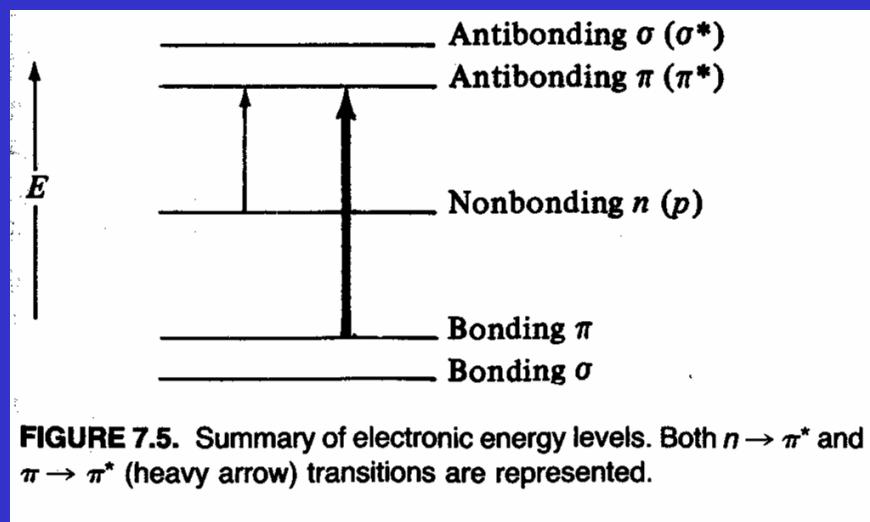

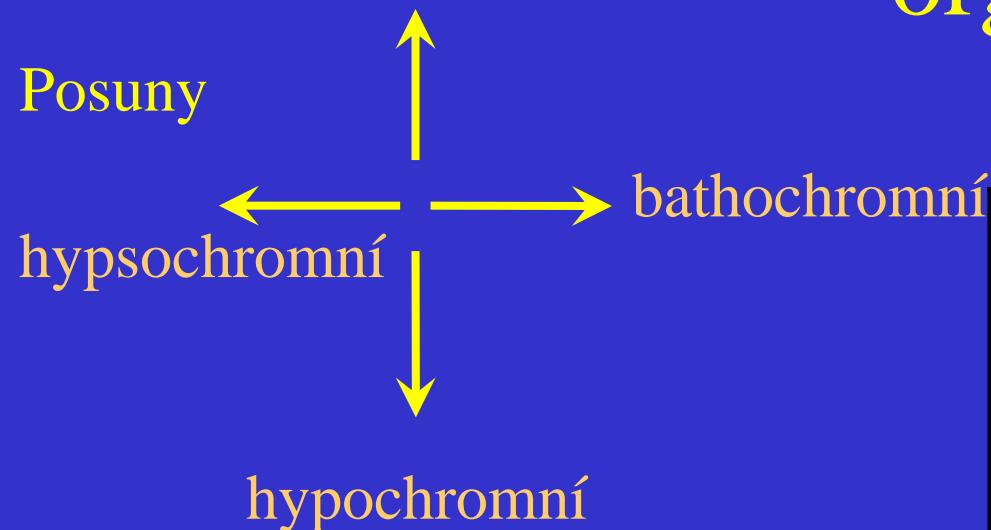

- foto-emisní detektory (vakuované fotonky, fotonásobiče ...)
- polovodičové detektory (fotovodivostní detektory, fotodiody, fotonásobiče; detektory s prostorovým rozlišením – CCD –charge-coupled device)

# Lampy

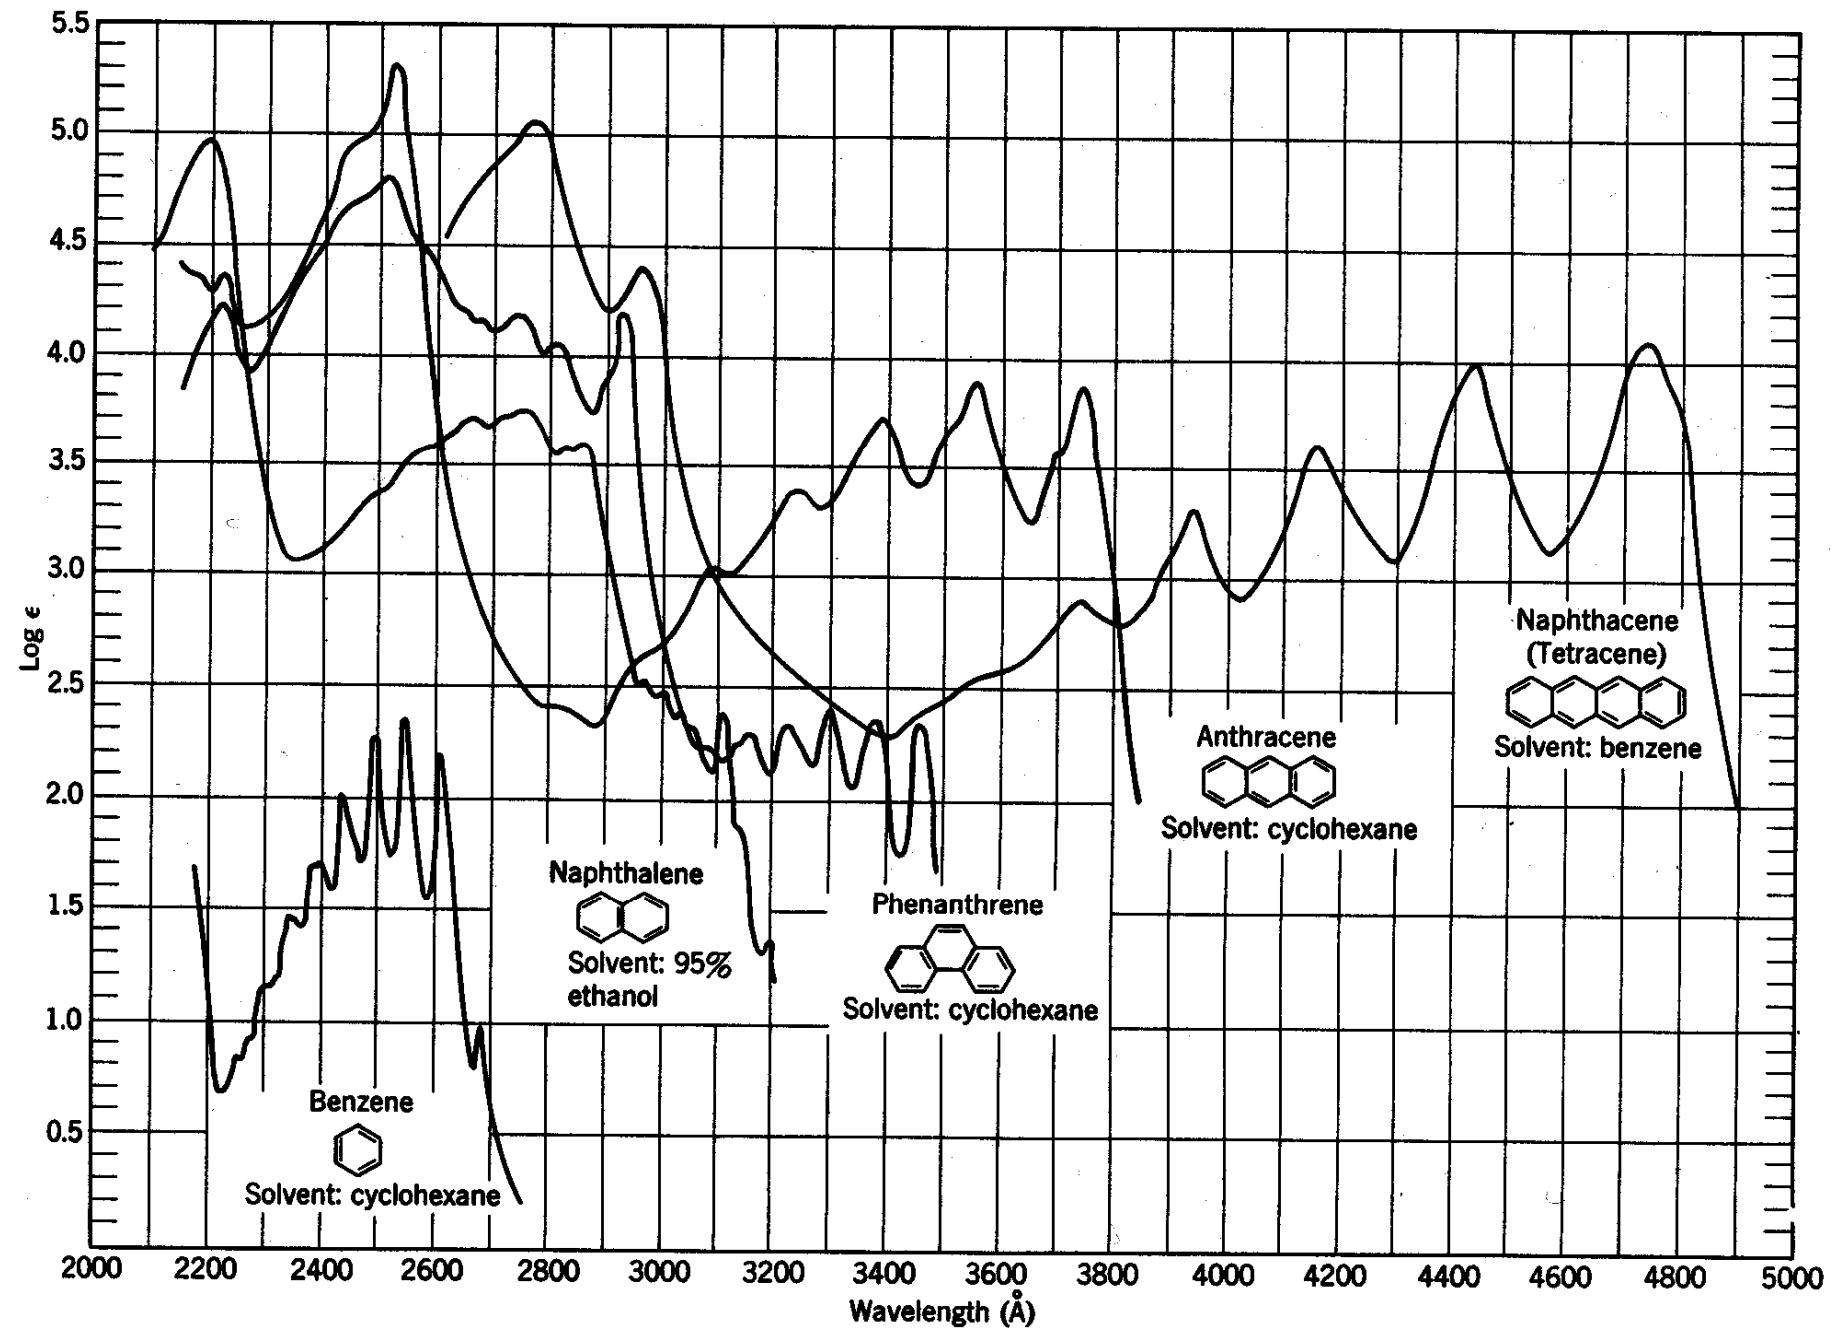

# Absorpční pásy organických molekul

## Efekty hyperchromní

Typ přechodu	$\epsilon_{\max}$
$n \rightarrow \pi^*$ (R)	< 100
$\pi \rightarrow \pi^*$ (K)	> 10 000
(B – benzenoid)	~ 500
(E - ethylenic)	2000 – 14 000

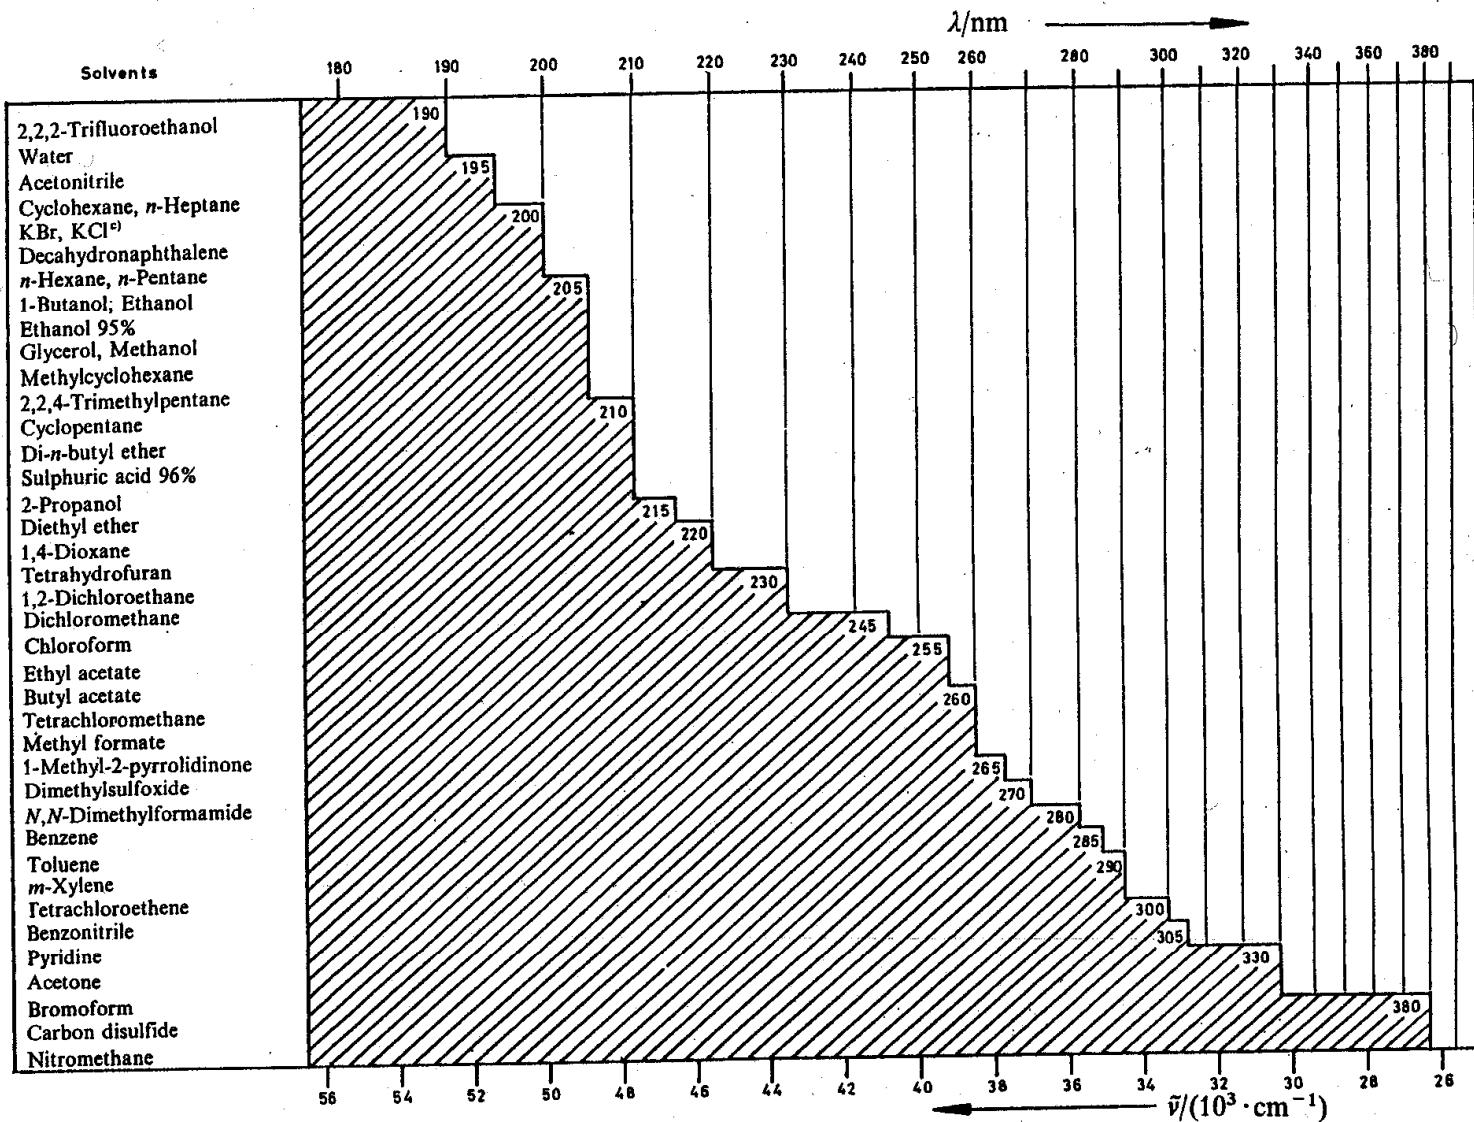

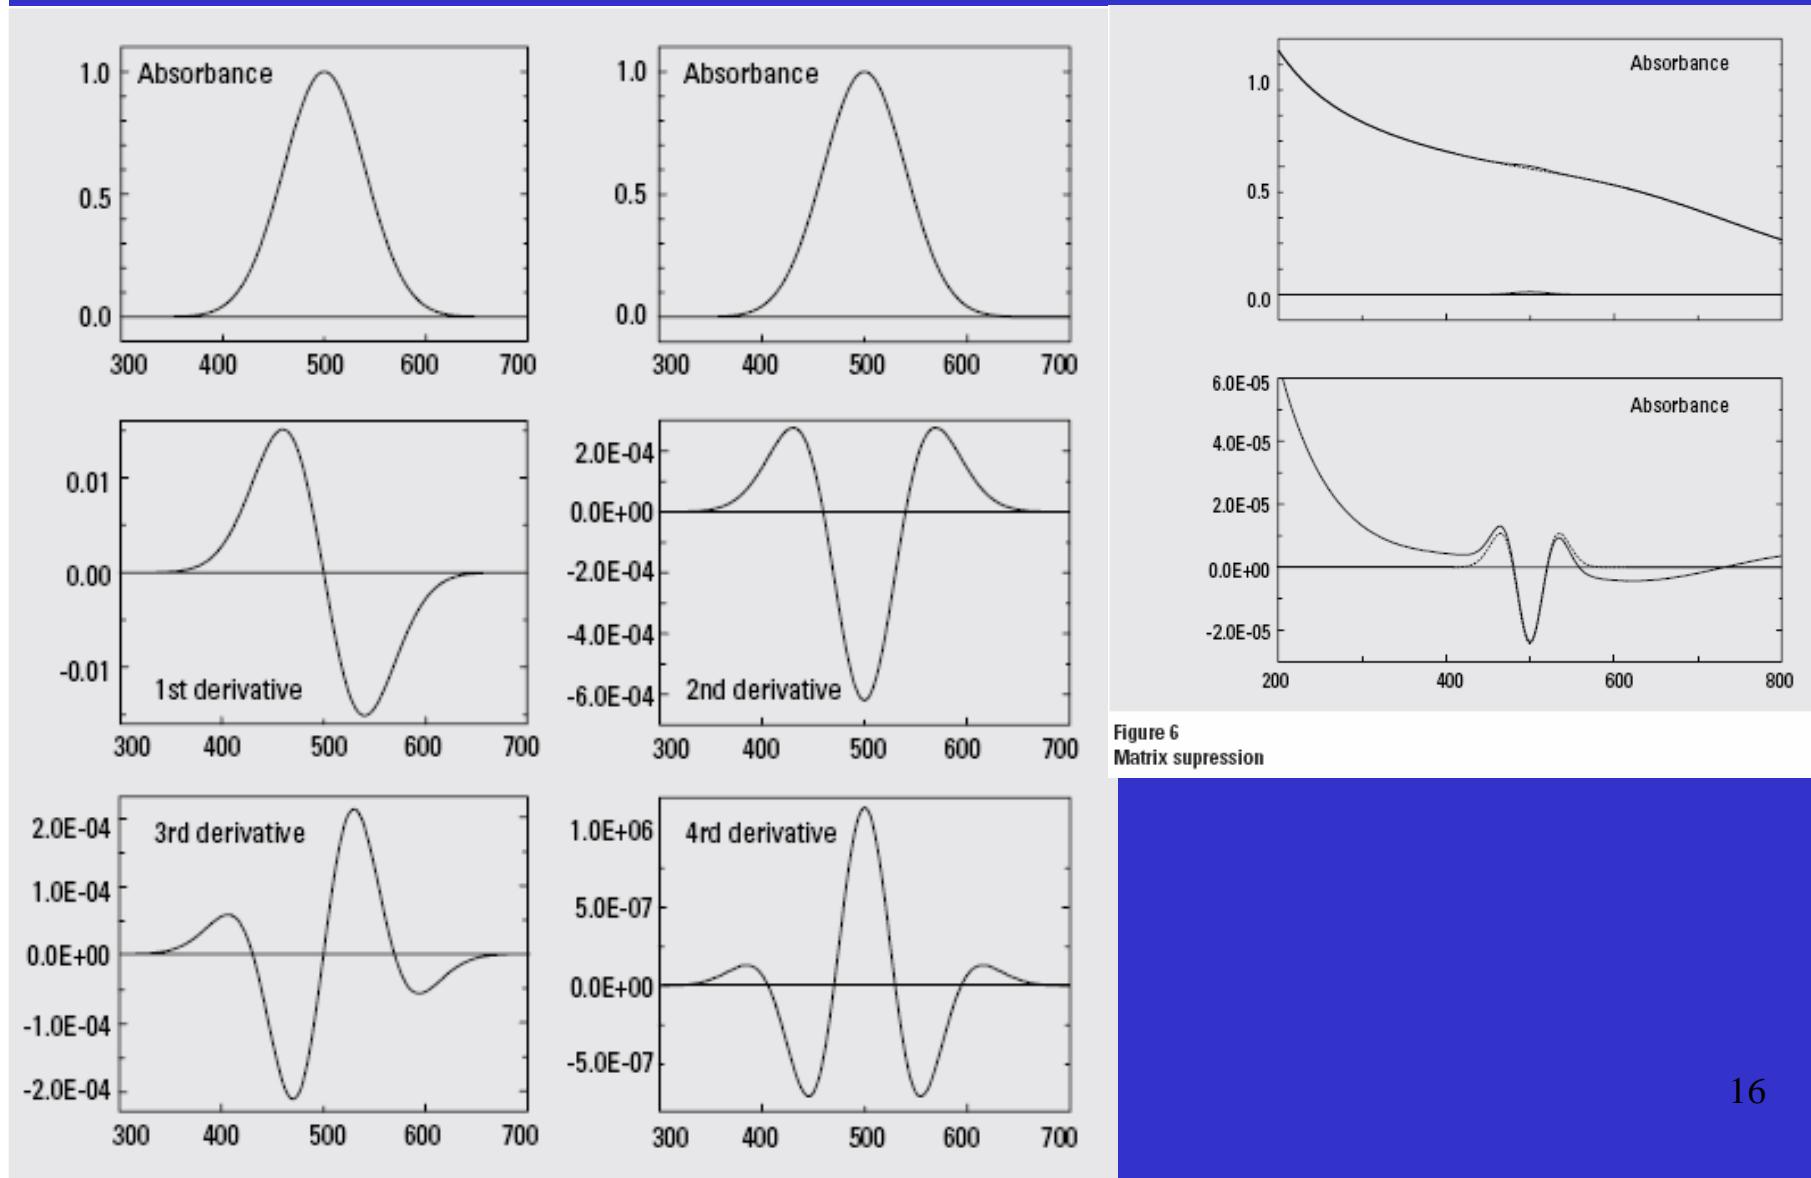

Table A-4. Ultraviolet "cut-off points"<sup>a)</sup> of spectroquality solvents commonly used in UV/Vis-Spectroscopy, for 1 cm pathlengths (accuracy ca.  $\pm 5$  nm)<sup>b)</sup>.

- <sup>a</sup> The "cut-off point" in the ultraviolet region is the wavelength at which the absorbance approaches 1.0 using a 1-cm cell path with water as the reference. Solvents should not be used for measurements below the cut-off point, even though a compensating reference cell is employed. The cut-off points are very dependent on the purity of the solvent used. Most of the solvents listed above are available in highly purified "spectrograde" quality.

$$d_{ij} = \sum_{k=1}^N c_{ik} s_{kj} + e_{ij}$$

*Bilinearity!*

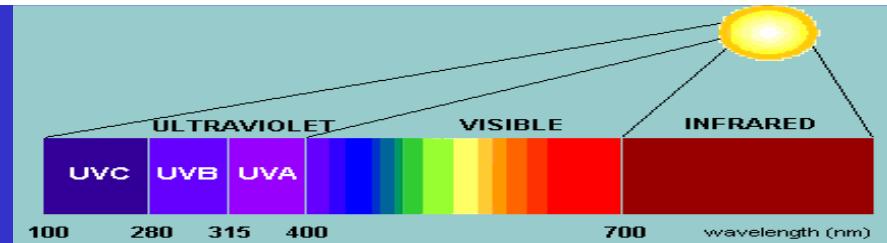

$D(\text{NR}, \text{NC})$  experimental data matrix

$C(\text{NR}, \text{N})$  row (concentration) profiles matrix

$S(\text{NC}, \text{N})$  column (spectra) profiles matrix

$E(\text{NR}, \text{NC})$  residual (noise, error) matrix

# solvatochromism

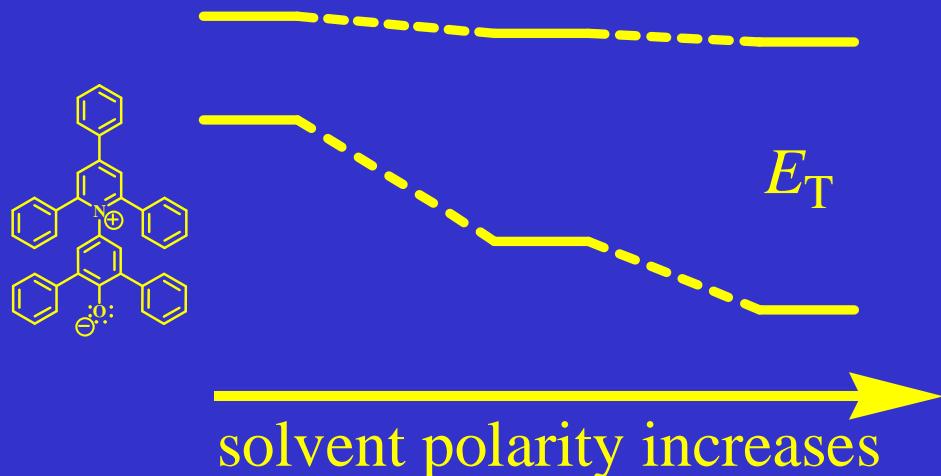

change in the position, intensity, and shape of absorption bands  
due to the surrounding medium

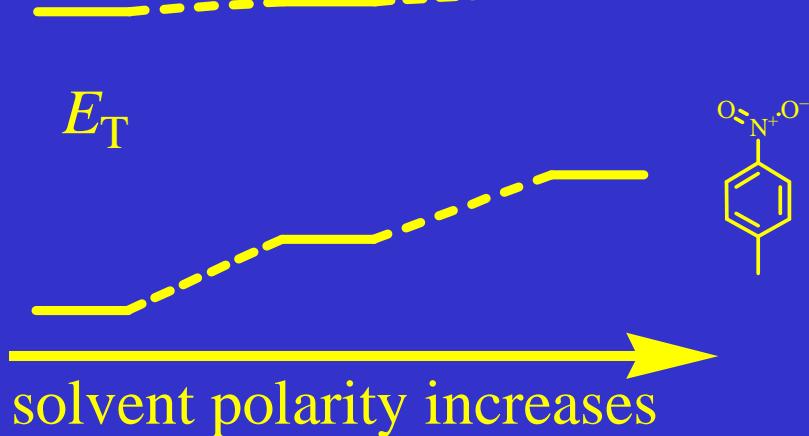

= **perichromism** (peri - around)

surrounding medium - liquids, solids, glasses, and surfaces

- negative solvatochromism  
a blue (hypsochromic) shift

- positive solvatochromism  
a red (bathochromic) shift

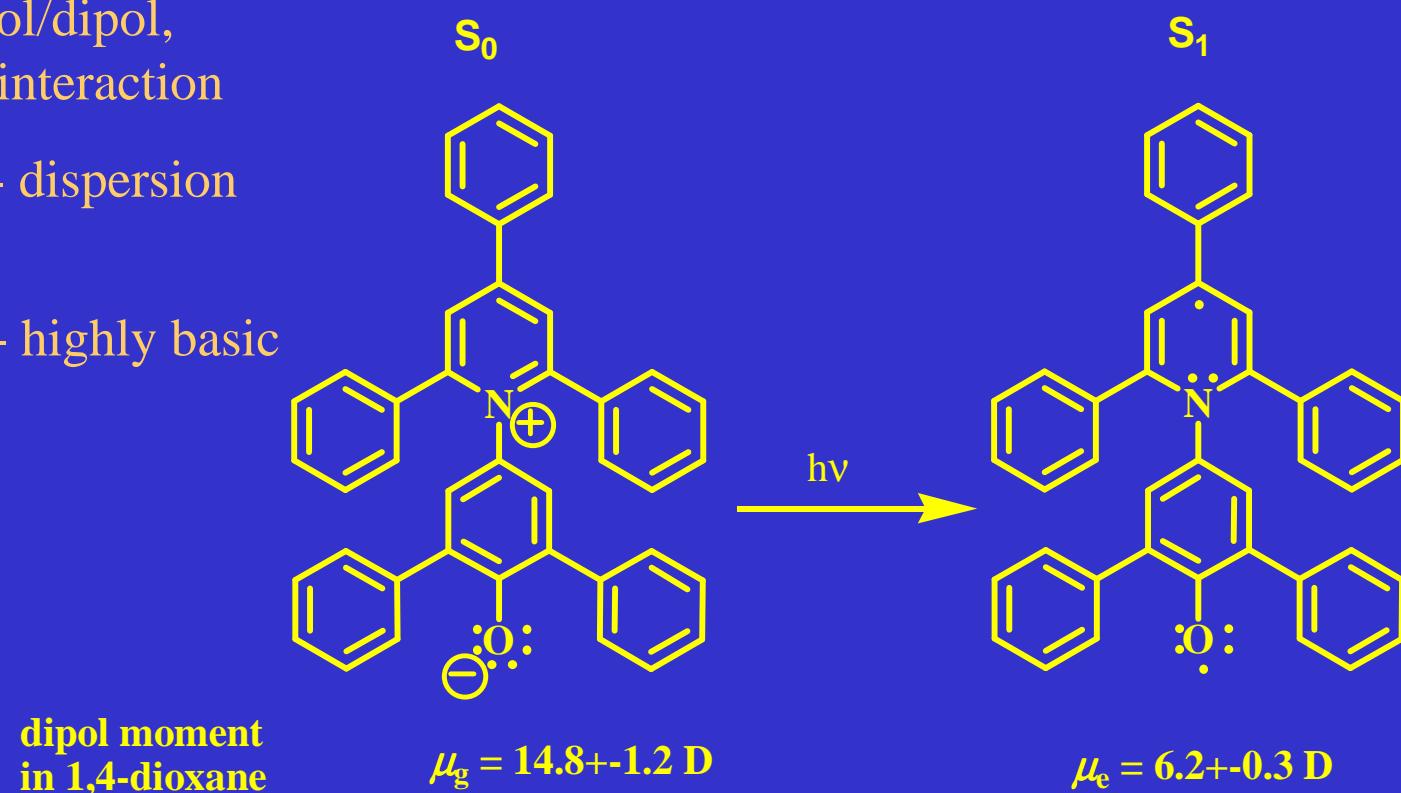

# Reichardt's dye

betaine-30

2,6-diphenyl-4-(2,4,6-triphenyl-pyridium)phenolate

- dipol moment - dipol/dipol, dipol/induced dipol interaction
- $\pi$  electron system - dispersion interaction
- phenolate oxygen - highly basic EPD center

# $E_T(30)$ and $E_T^N$ scale of solvent polarity

$E_T$  - molar electronic transition energy

$$[E_T] = \text{kcal/mol}$$

$$[E_T^N] = 1$$

$$\begin{aligned} E_T(30) &= hc \tilde{\nu}_{\max} N_A = (2.8591 \text{ E } -3)(\tilde{\nu}_{\max} / \text{cm}^{-1}) \\ &= 28591 / (\lambda_{\max} / \text{nm}) \end{aligned}$$

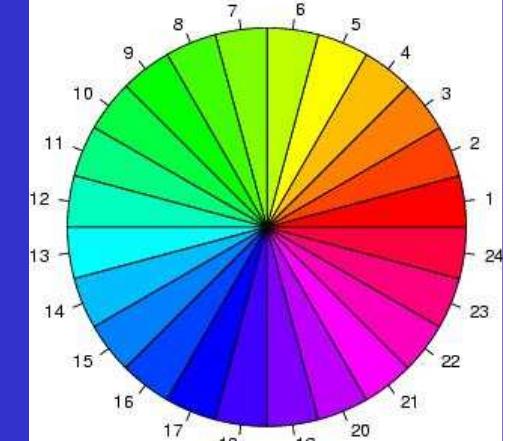

$$\begin{aligned} E_T^N &= (E_T(\text{solvent}) - E_T(\text{TMS})) / (E_T(\text{water}) - E_T(\text{TMS})) \\ &= (E_T(\text{solvent}) - 30.7) / 32.4 \end{aligned}$$

$$E_T^N(\text{TMS}) = 0.000 \quad E_T^N(\text{H}_2\text{O}) = 1.000$$

TMS = Tetramethylsilane

Látka	$E_T^N$
<i>n</i> -hexan	0.009
Dichlor methan	0.309
EtOH	0.608
Voda	1
