

Odd.: Heterokontophyta Třída: Chrysophyceae Řád: Hydrurales

*Hydrurus foetidus*

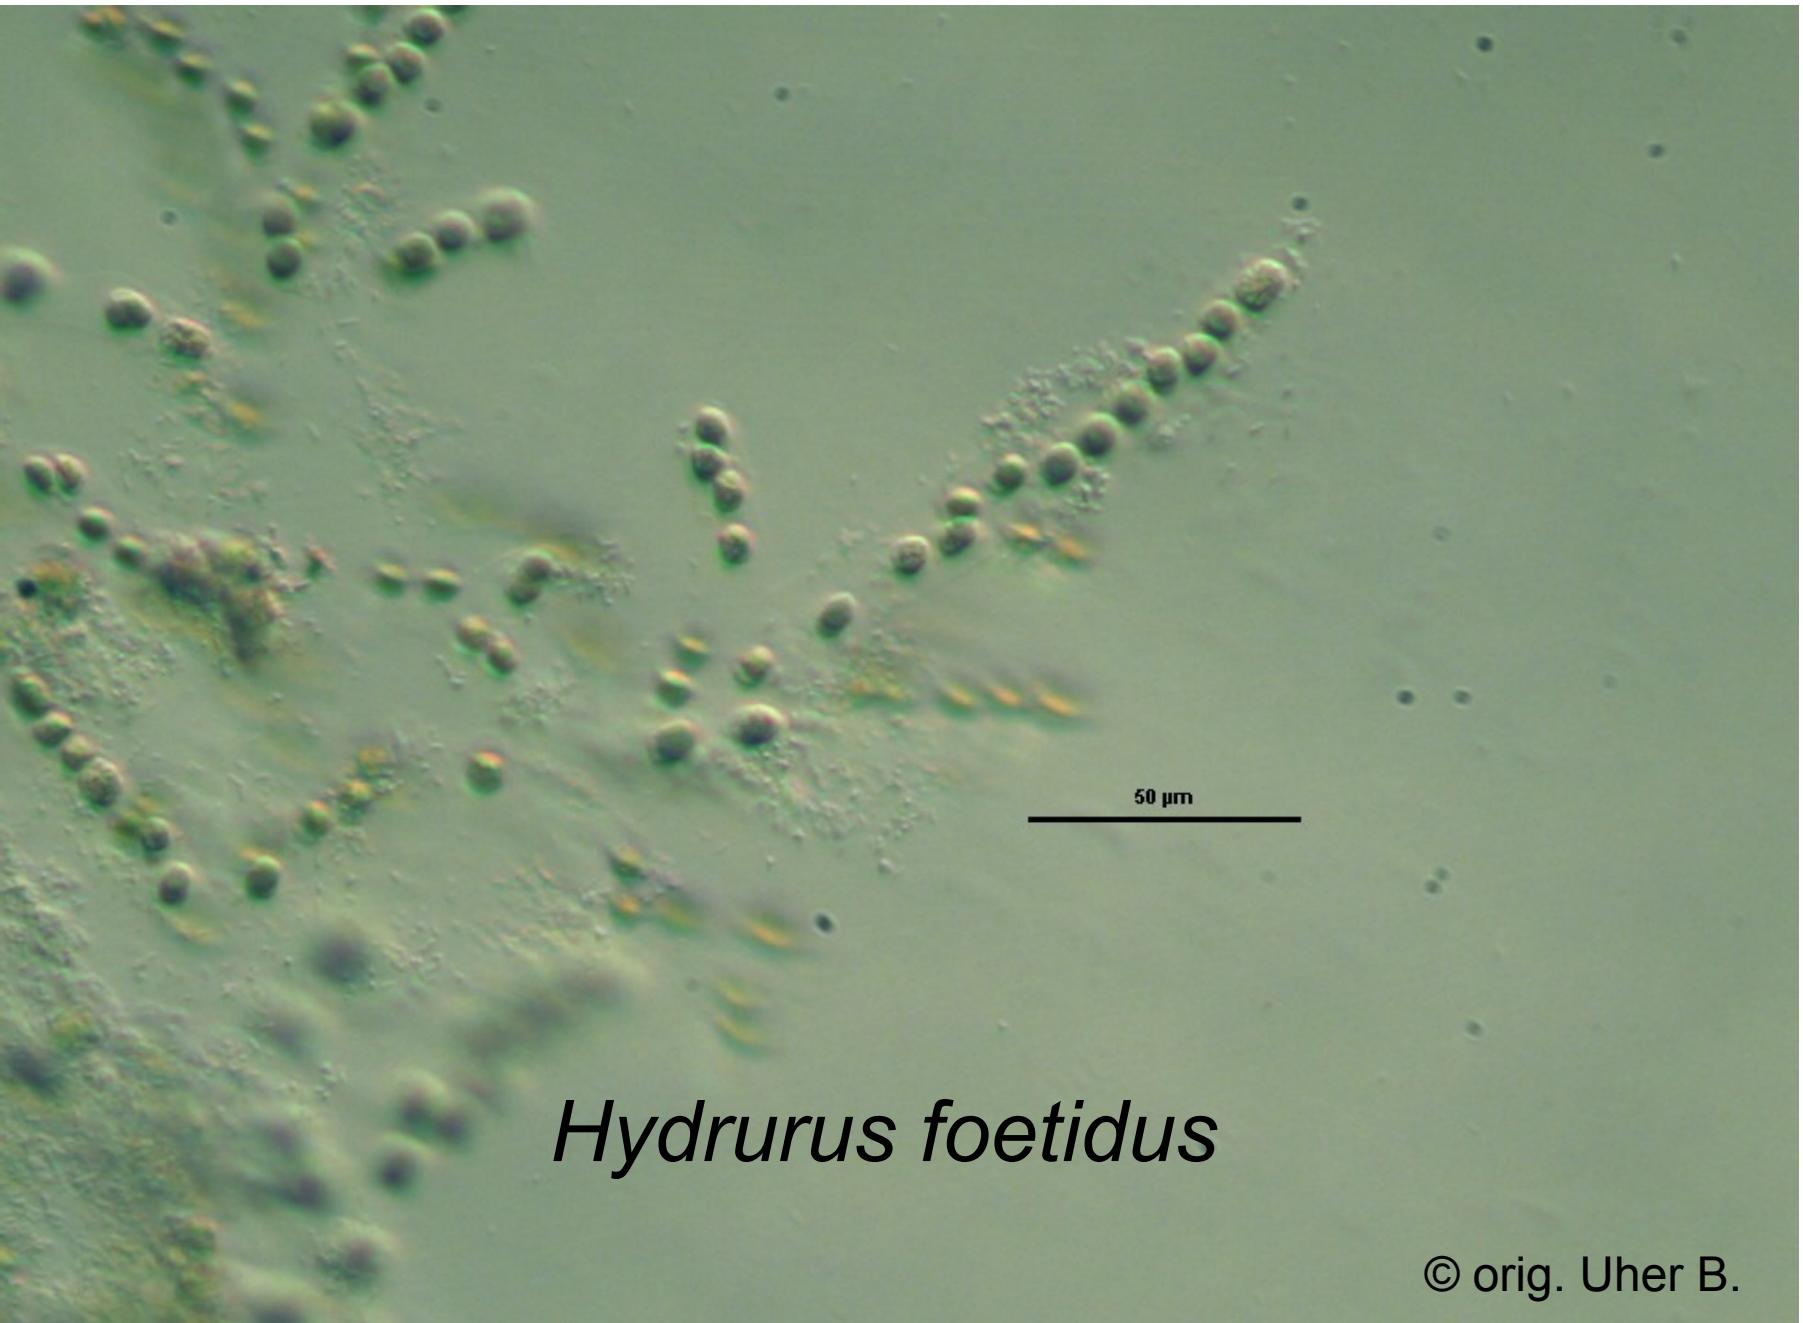

© orig. Uher B.

A micrograph showing a green, branching Hydra specimen against a dark background. The organism has a central body with several long, tentacle-like branches extending upwards and outwards. The branches are densely covered with small, bright green fluorescent spots, likely representing nerve fibers or ganglia. The overall shape is somewhat irregular and elongated.
