

ÚVOD DO KVANTITATIVNÍ REAL-TIME PCR

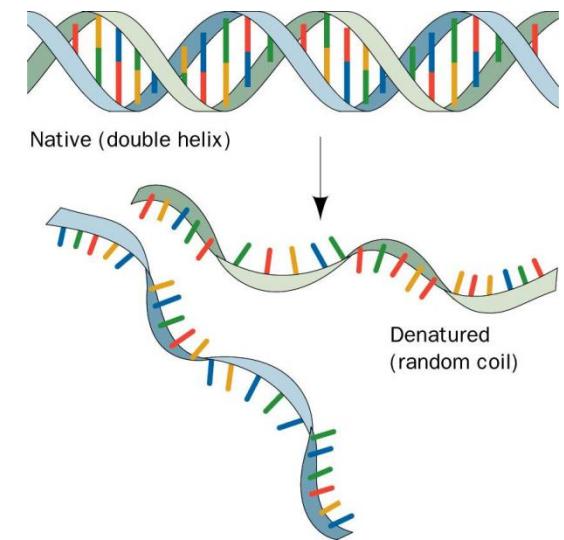

V. Návrh primerů a sond

Hybridizace

- Úspěšný annealing sondy a primerů je kritický předpoklad úspěšné PCR

- Sekvence
- Koncentrace solí
- Tvorba heterodimerických stabilních struktur
- Párování bazí - nejen Watson a Crick
- Sekundární struktura
- Teplota tání DNA T_m

Melting temperature Tm

- jeden z nejdůležitějších parametrů, determinující annealingovou teplotu
 - Tm – teplota, při které je 50% daného oligonukleotidu denaturováno
 - „cooperativní melting“ – usnadněná denaturace po disociaci prvního páru bazí
 - Sekvence: A=T < G≡C
-
- Rychlosť renaturace (a tedy i Tm) je úmerná délce řetězce a jeho koncentraci a nepřímo úmerná komplexitě molekuly (struktura)
 - Elektrostatické interakce mezi fosfátovými molekulami
 - kationty maskují + náboje fosfátů - vyšší iontová síla vede k vyšší Tm

Oligonukleotidy kratší než 20bp

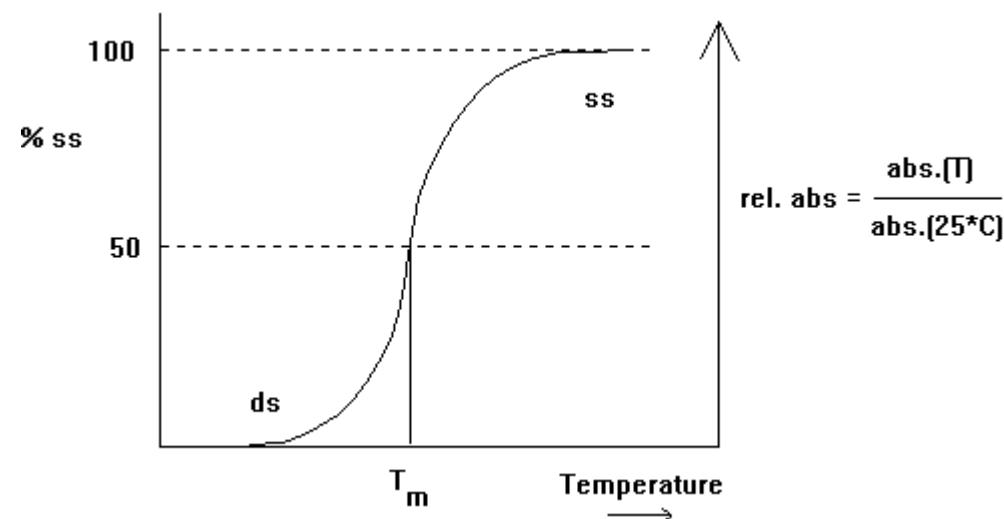

$$T_m = 2 \times (A+T) + 4x(G+C)$$

Iontová síla, %GC a délka řetězce (N)

$$T_m = 81,5 + 16,6 (\log_{10}[\text{Na}^+] + 0,41(\%GC) - (625/N))$$

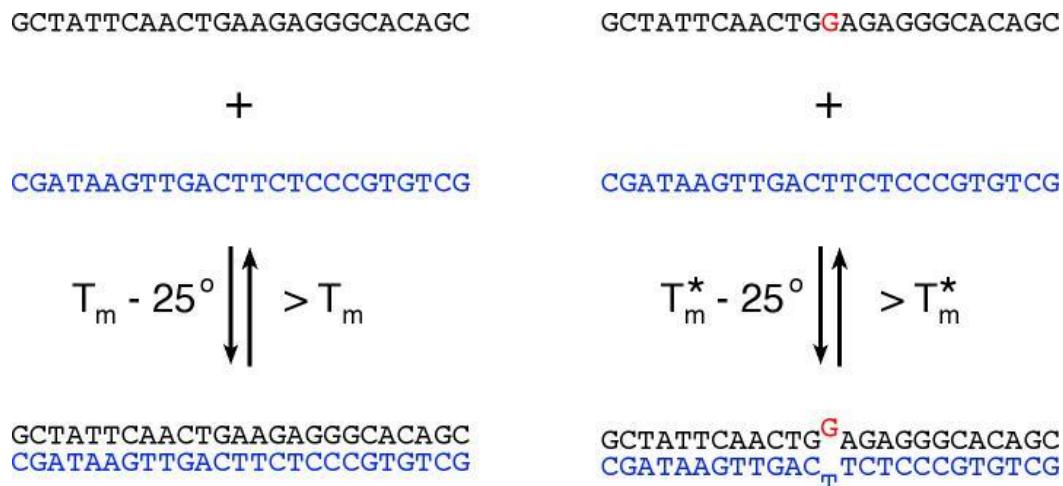

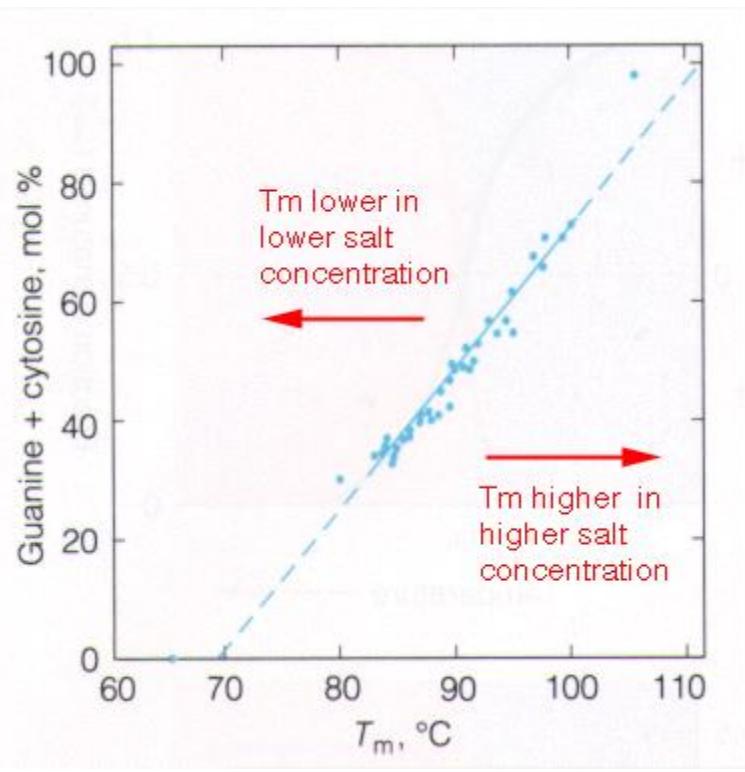

Web-based kalkulátory

<http://insilico.ehu.es/tm.php>

Design primerů a sond

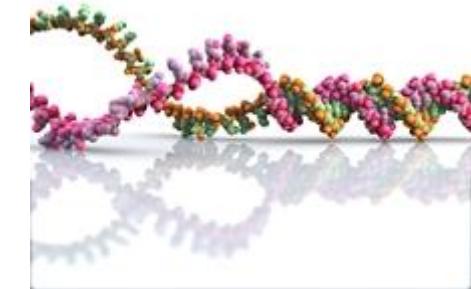

Melting temperature Tm

note: T_m^* is 4° lower than T_m

(In general, there is a 1° drop for every 1% mismatch)

Gibbsova (volná) energie a její změna (ΔG , ΔG^0)

- Schopnost látek jít do reakce
- Sekundární struktura DNA
- ΔG závisí na změně vnitřní energie a entropie
- Změna volné energie ΔG^0 (množství energie uvolněné nebo absorbované během reakce za stejné teploty a tlaku) - spontánní reakce - $\Delta G < 0$
- Znalost termodynamického příspěvku párování bazí, mismatches, volných konců, vlásenkových struktur a smyček – predikce parametrů hybridizace
- Predice sekundární struktury – *nearest neighbor*
 - *helix initiation factor* (GC/AT)
 - *helix propagation* energie nutná pro vytvoření následujícího hybridizačního páru
 - symetrie sekvence (duplexu)
 - *Loop regions* – smyčky, vlásenky, výdutě atd.

Faktory ovlivňující stabilitu DNA DNA/RNA duplexu

1. Počet odpovídajících párů bazí

- Kombinace vodíkových můstků a hydrofobních interakcí
- Pozice a typ neodpovídajícího páru (*mismatch*)

2. Sekvence – nearest neighbor

3. Sekundární struktura

- Charakter cílové sekvence
- Kompetice primeru nebo sondy s komplementárním řetězcem cílového duplexu

4. Volné konce

- Interakce mezi 5' a 3' konci hybridizovaného oligonukleotidu a nejbližší sousedící báze

Faktory ovlivňující stabilitu DNA DNA/RNA duplexu

5. Iontová síla

- Koncentrace iontů, zejména Mg^{II+}
- Kationty kompenzují negativní náboj fosfátových skupin a usnadňují formování duplexu
- Stabilita duplexu (T_m) je úměrná koncentraci iontů

6. Teplota

- Se stoupající T je udržení duplexu energicky náročnější, po překročení určité T je preferována ssDNA – vyšší entropie celého systému

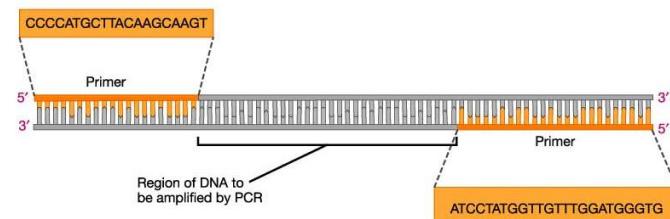

Není tedy nutná shodná T_m , ale shodná účinnost hybridizace obou primerů.

Primery se stejnou T_m , ale rozdílnou ΔG^0 , mohou vykazovat rozdílnou úspěšnost při tvorbě duplexu než primery s odpovídající ΔG^0 .

Design primerů

- Optimálně: primery jejichž 5'konce tvoří stabilní duplex, $\Delta G^0 < 10$ kcal/mol/37°C
- Plynulý přechod ΔG^0 směrem k 3'konci až k cca -6kcal/mol.
- Eliminace misprimingu (vzniklého hybridizací pouze 3'konce)
- Vyloučení repetitivních oblastí, které mohou tvořit sekundární struktury
- Komplementarita primerů – primer dimery
- Specifita – hybridizace k jedinečnému místu v genomu (BLASTn)

Vliv reakčního prostředí – i ideálně navržené primery mohou měnit své vlastnosti v závislosti na použitém PCR pufru a dalších parametrech PCR – vždy je nutná optimalizace jednotlivých PCR

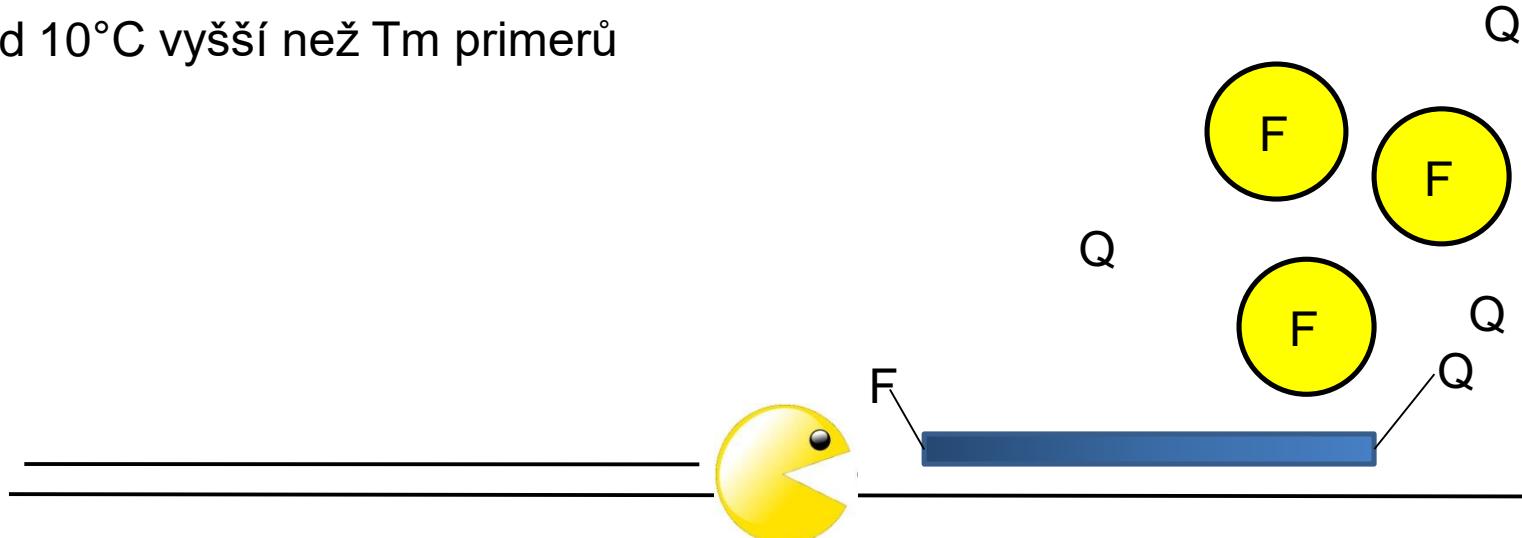

Design sond

- Různý design podle toho, zda je cílem kvantifikace DNA, mRNA nebo provedení alelické diskriminace nebo SNP
- Použitá chemie
- Detekce DNA, RNA nebo obou zároveň? Rozlišení HIV RNA od DNA začleněné do genomu
- Kombinace fluoroforu a zhášeče
- Modifikace sondy – LNA, PNA, MGB atd.
- Multiplex assay

Design hydrolyzačních sond

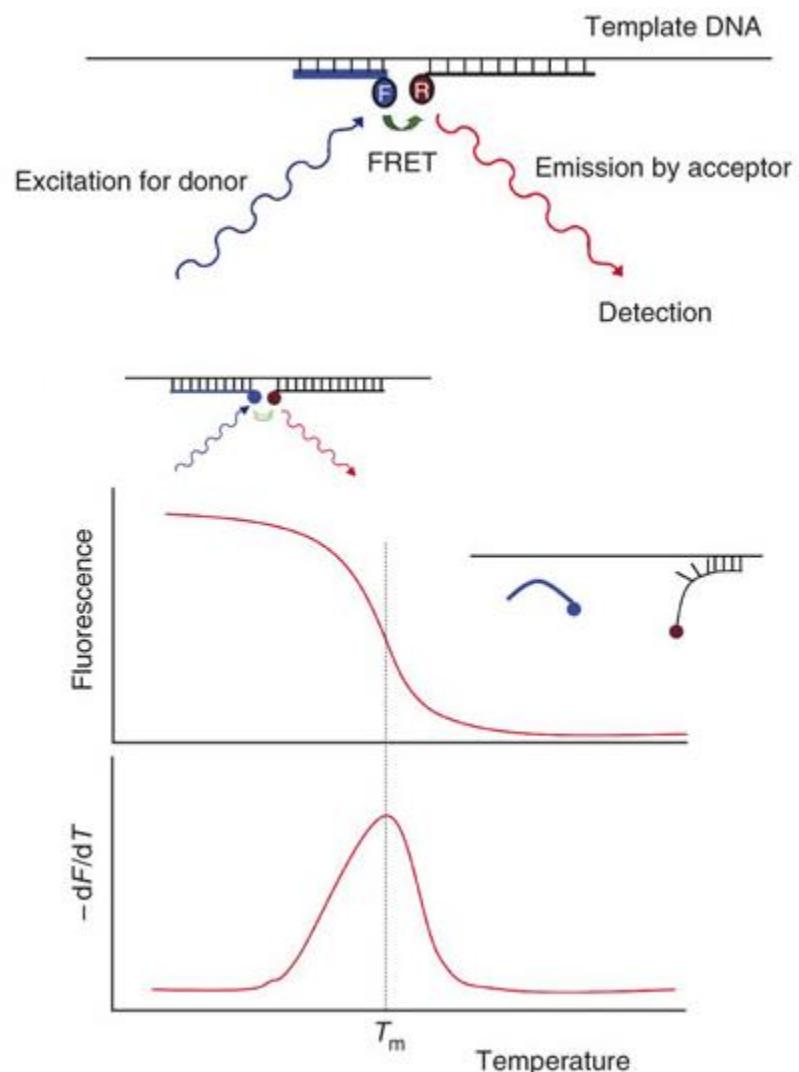

- qPCR TaqMan - dvoukrokový proces – denaturace a annealing/extension
- Co nejnižší Ct a nejvyšší ΔR (ΔR_n)
- Umístění 5' konce sondy v rámci stanovené sekvence co nejbliže 3' konci jednoho z primerů – účinné štěpení sondy
- Optimální délka do 30 nukleotidů, obsah GC do 30%
- AT bohaté sekvence – začlenění LNA, PNA nebo MGP
- G – účinný quencher
- Minimum repeticí, zejména GGGG, začlenění inosinu do repetice řeší tento problém
- Tm proby od 10°C vyšší než Tm primerů

Design hybridizačních sond

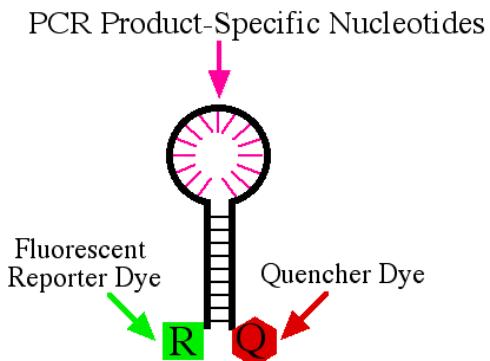

(Lightcycler probes)

- Sondy by měly být umístěny co nejdál od primeru 5' – odečet fluorescence v annealingové fázi
- GC 50%
- Každá sonda má délku 23-35bp
- Sondy o stejné Tm – musí se vázat současně ; Tm sondy o 5-10°C vyšší než Tm primerů
- 3' konec akceptorové sondy fosforylován
- Donor FAM, akceptor Cy5 nebo Lightcycler Red 640/705
- Vzdálenost mezi sondami 1-5 bazí (zajištění FRET)

Design molekulárních majáků

- Vazba majáku ideálně uprostřed amplikonu
- Tm komplementárních ramen o 7-10°C vyšší než Tm primerů
- Délka do 39 bp - omezení sekundárních struktur

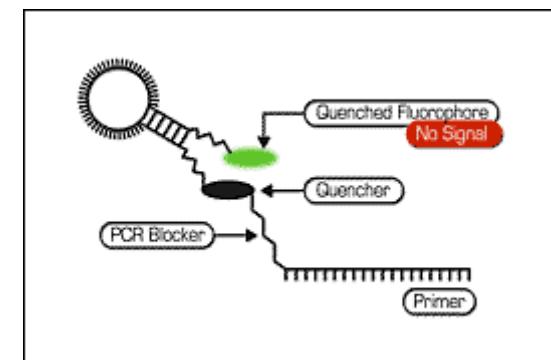

Design scorpion primers

Sonda připojena k 5' konci primeru a je komplementární
k nově syntetizovanému řetězci

- vlastní hybridizace sondy je intramolekulární událost
- 17-27bp; Tm sondy < Tm primeru
- Cíl sondy – 0-20bp od 3'konce primeru
- Hairpin struktura
- výpočet ΔG pro uzavřenou i hybridizovanou formu

– MFold <http://www.bioinfo.rpi.edu/applications/mfold>

Design primerů

- Délka amplikonu, Tm, účinnost amplifikace i výtěžek
- Správná sekvence – BLASTn
- Sestřih – rozhraní exon/intron
- 3' konec – klíčový pro eventuální mispriming G/C
- Repetice (zejména GC)
- Sekundární struktura, intraprimer homology
- Obsah GC 35-65%
- Délka 15-25bp
- Tm 55-60°C
- ΔG do -10kcal/mol
- V případě převažujících AT – vhodné začlenění LNA
- Eventuální modifikace - na 5' konci

Design primerů a sond

Design primerů – web resources

Nový pár primerů

Nízká komplexita sekvence (repetice)

Tm mimo rozsah

GC% mimo rozsah

Ne Vysoká stabilita 3' konce

Ano

Vnitřní nebo vzájemná komplementarita

Vysoké BLAST skóre

Primer – dimery

- Primer 3

http://biotools.umassmed.edu/bioapps/primer3_www.cgi

Primer3: WWW primer tool

Pick primers from a DNA sequence.

Paste source sequence below (5'>3', string of ACGTNacgn -- other letters treated as N -- numbers and blocks ignored): FASTA format ok. Please N-out undesirable sequence (vector, ALUs, LINES, etc.) or use a [Minimum Library \(repeat library\)](#).

Pick left primer or use left primer below. Pick hybridization probe (internal oligo) or use oligo below. Pick right primer or use right primer below (3'>5' on opposite strand).

Sequence Id: A string to identify your output.

E.g. 50.2 requires primers to mismatch the 2 bases at positions 50 and 51. Or mark the [source sequence](#) with [and] e.g. ...ATCT[CCCC]TCAT... means primers must flank the central CCCC.

E.g. 401.7 68.3 forbids selection of primers in the 7 bases starting at 401 and the 7 bases at 68. Or mark the [source sequence](#) with < and > e.g. ...ATCT->CCCC>TCAT... forbids primers in the central CCCC.

Excluded Regions:

The screenshot shows the Primer Express 3.0 software interface. A central window is titled "TaqMan® MGB Quantification # 1". The window has tabs for "Sequence", "Parameters", "Primers / Probes", and "Order". Below the tabs, there is a "File Name" input field. The main area displays a sequence of DNA with annotations. At the top of the sequence area, it says "Length 1143 bp. Selection 1144 to 1144 Double Stranded". The sequence itself is a long string of nucleotides from position 50 to 950. The sequence starts with ATGATGTCTT and ends with GGCAGCTTC. There are several annotations along the sequence, such as GCAGCTCTT, CCCTCCCGCTG, and AGGGACCTGC. A scroll bar is visible on the right side of the sequence area.

TaqMan® Gene Expression Assays

Click a tab below to learn more about TaqMan Gene Expression Assays. To find and order assays, click the Search tab.

Ordering Information **Assay Search** **Product Description** **Specifications** **Literature/Support** **Related Products**

To begin, select a search method below.

- **Keyword:** Search by gene symbol, gene name, public accession number, biological process, or molecular function.
- **Batch ID:** Search by uploading a file containing multiple assay IDs, RefSeq accession numbers, GenBank GI #s, LocusLink IDs, gene symbols, IMAGE Clone IDs, or species.

Gene Expression Quantification with Real-Time PCR - Simple and Fast

- ▶ Design real-time qPCR assays online in seconds.
- ▶ Rely on just 165 prevalidated probes for over five million qPCR assays for a large variety of organisms.
- ▶ Reduce the cost of gene expression analysis by performing multiplex qPCR assays with Universal ProbeLibrary Reference Gene Assays.

Universal ProbeLibrary for Human

Specify your target(s):

By sequence ID, gene name or keyword

e.g. ENST00000331789, NM_001101 or X00351 or beta-actin

or

By sequence

e.g.

```
>part of X00351 Human mRNA for beta-actin
CAGGCATCGTACCAACTGGGACGACATGGAGAAAATCTGGCACACACCTCTACAAT
GAGCTCGTGTGGCTCCCGAGGAGCACCCTGCTGCTGACCGAGGGCCCCCTGAACCCC
AAGGCCAACCGCGAGAGATGACCCAGATCATGTTGAGACCTTAACACCCCCAGCCATG
TAGITGCTATCCAGGCTGTGTATCCCTGTACGCCCTGGCGTACCACTGGCATCGTG
ATGGACTCCGGTGACGGGTACCCACACTGTGCCCATCTACGAGGGTATGCCCTCCCC
```

Automatically select an intron spanning assay. Design multiplex PCR with reference gene.

Design primerů a sond

Po dnešní přednášce:

- Rozumíte vlastnostem primerů i základních typů sond a znáte faktory, které ovlivňují jejich hybridizaci a účinnost
- Umíte navrhnut optimální sekvenci primerů i hydrolyzační sondy pomocí dostupných programů a rozumíte parametrům designu
