

Zkouška z MAS02, 7. 9. 2021

Popis situace: U 23 českých profesionálních basketbalistů byly zjišťovány hodnoty těchto proměnných:

vyska ... tělesná výška v cm

hmotnost ... tělesná hmotnost v kg

tuk ... procento tělesného tuku (u basketbalistů by se tyto hodnoty měly pohybovat od 7 % do 13 %)

VO2_max ... aerobní kapacita (maximální množství kyslíku za minutu, které může organismus využít při intenzivním fyzickém zatížení; jedná se o ukazatel tělesné zdatnosti; ideální hodnota by se měla pohybovat kolem 60 ml/kg)

Údaje jsou uloženy v souboru basketbal.csv.

Cíle výzkumu:

1. Pomocí metod korelační analýzy prozkoumat závislosti mezi proměnnými.

2. Sestavit model vícenásobné lineární regrese, který umožní popsat závislost aerobní kapacity na výšce, hmotnosti a procentu tělesného tuku.

Upozornění: Pro ověření vícerozměrné normality dat je použita funkce CM.test z knihovny mvtnorm.

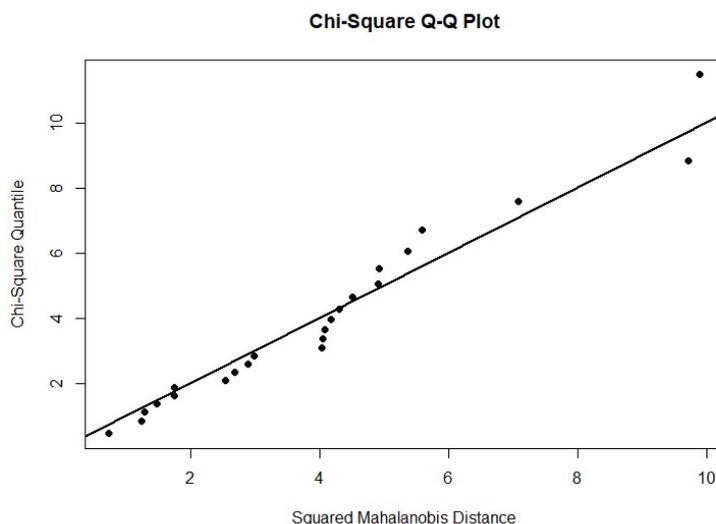

Výstupy ze systému R

```
> library(mvtnorm)
> CM.test(basketbal,qqplot=T)
      Cramer-von Mises test for Multivariate Normality

data : basketbal

CM          : 0.07362245
p-value     : 0.5191481

Result  : Data are multivariate normal (sig.level = 0.05)
