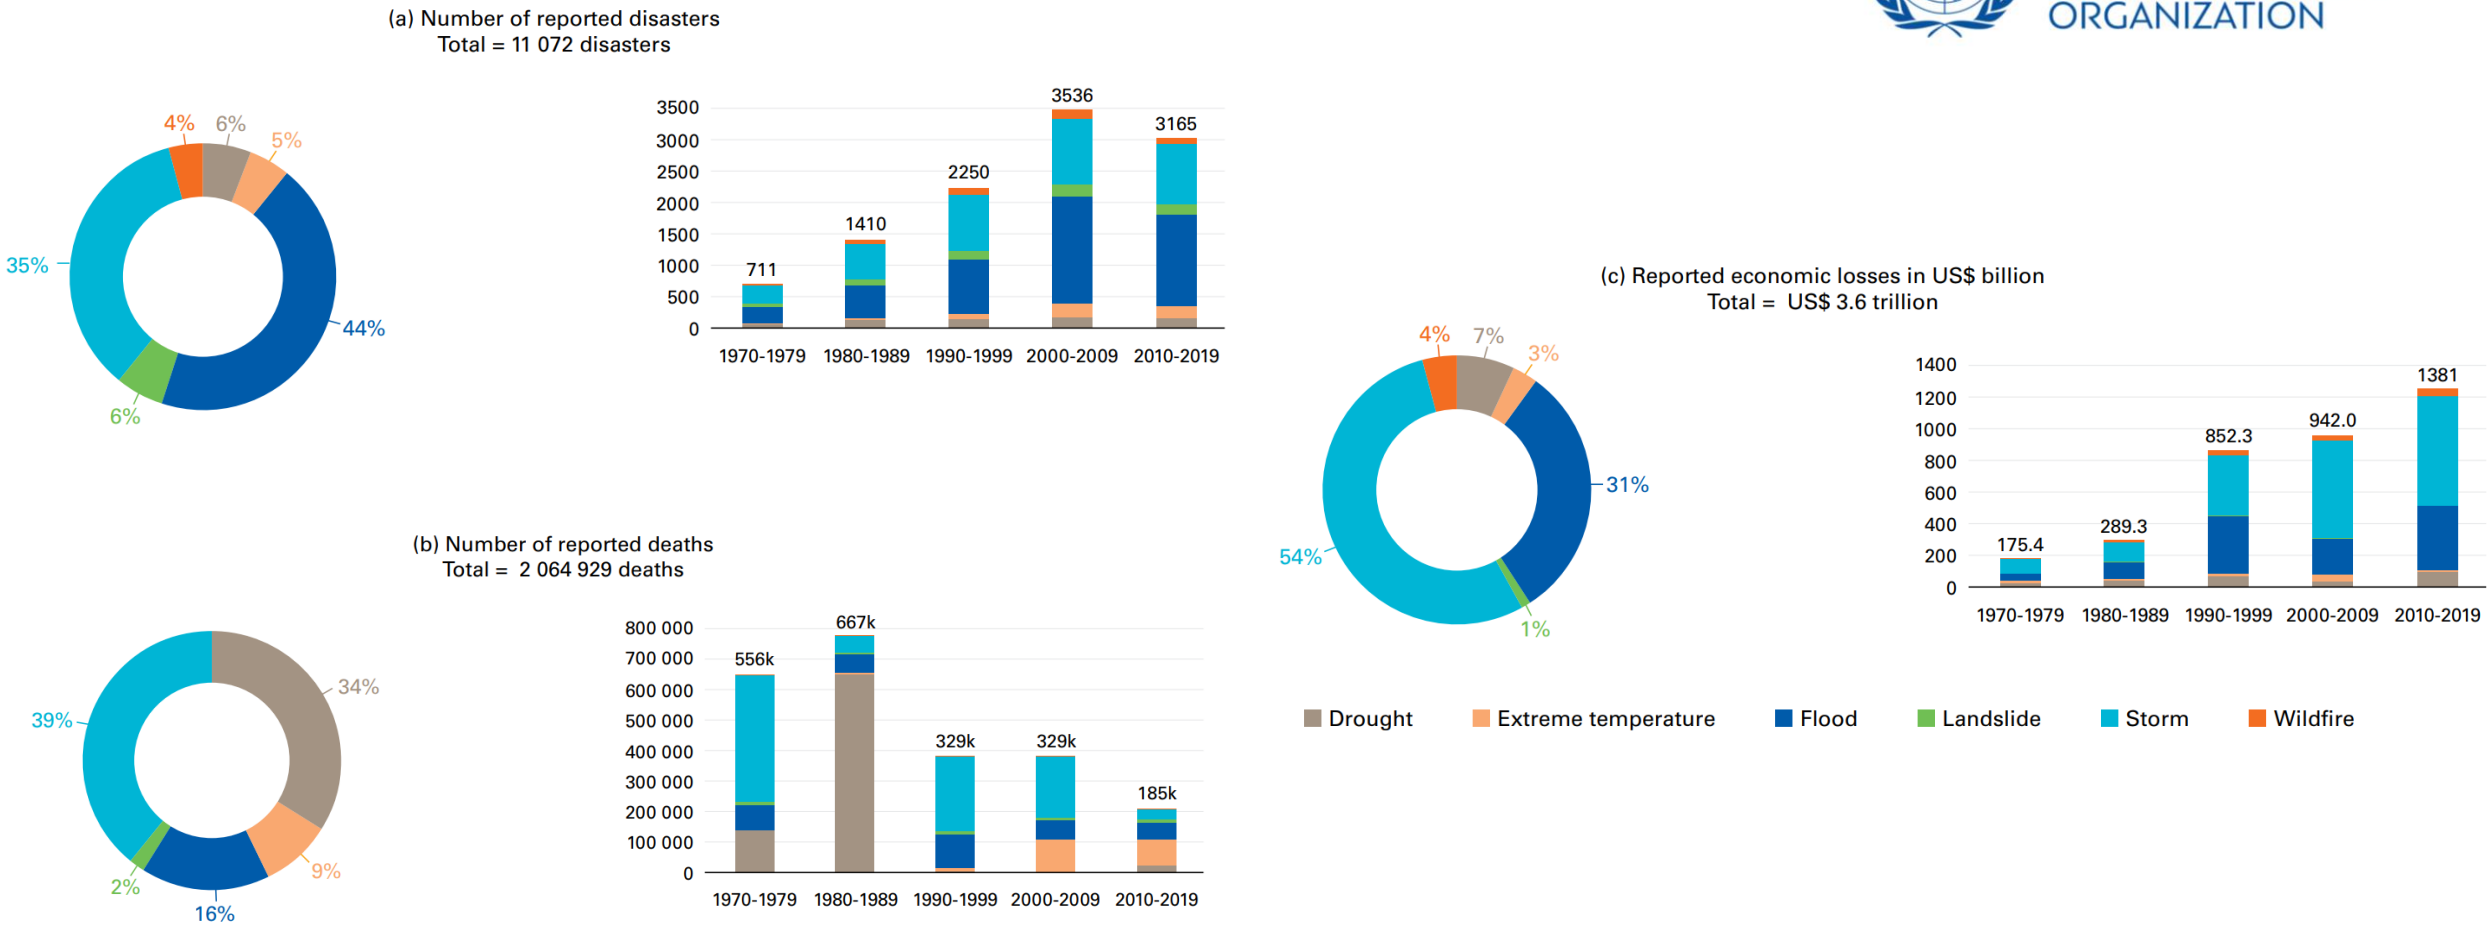
(a) number of disasters, (b) number of deaths and (c) economic losses during 1970–2019 from all hazards.

published by World Meteorological Organization (WMO).



Reasons for more frequent extreme rainfall events:

1) Global warming

2) Urbanization

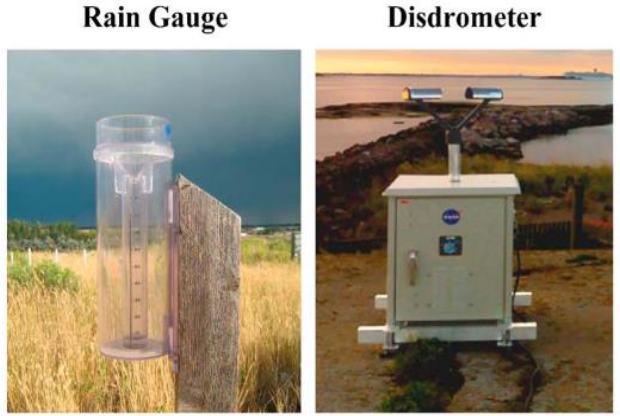
Rainfall observation/prediction system

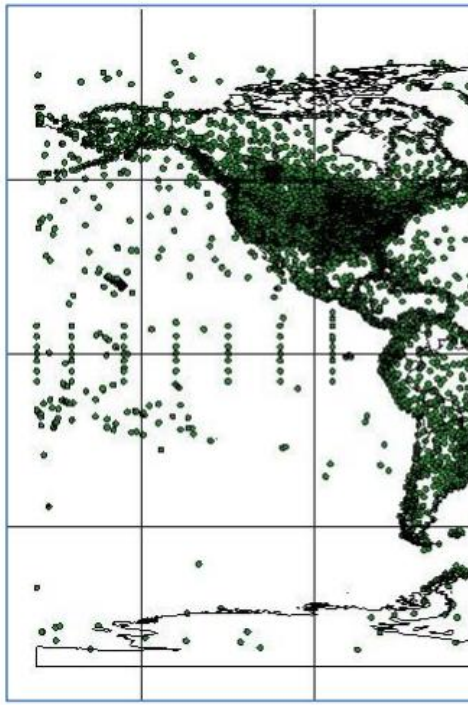
https://www.worldweatherattribution.org/heavy-rainfall-which-led-to-severe-flooding-in-western-europe-made-more-likely-by-climate-change/

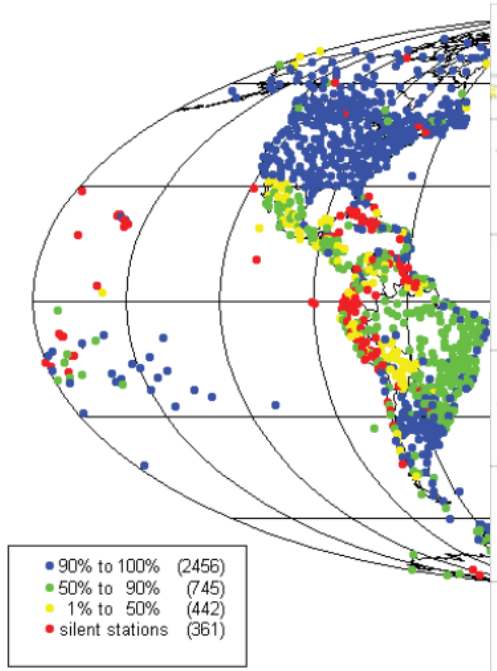
Ground-based rainfall observation

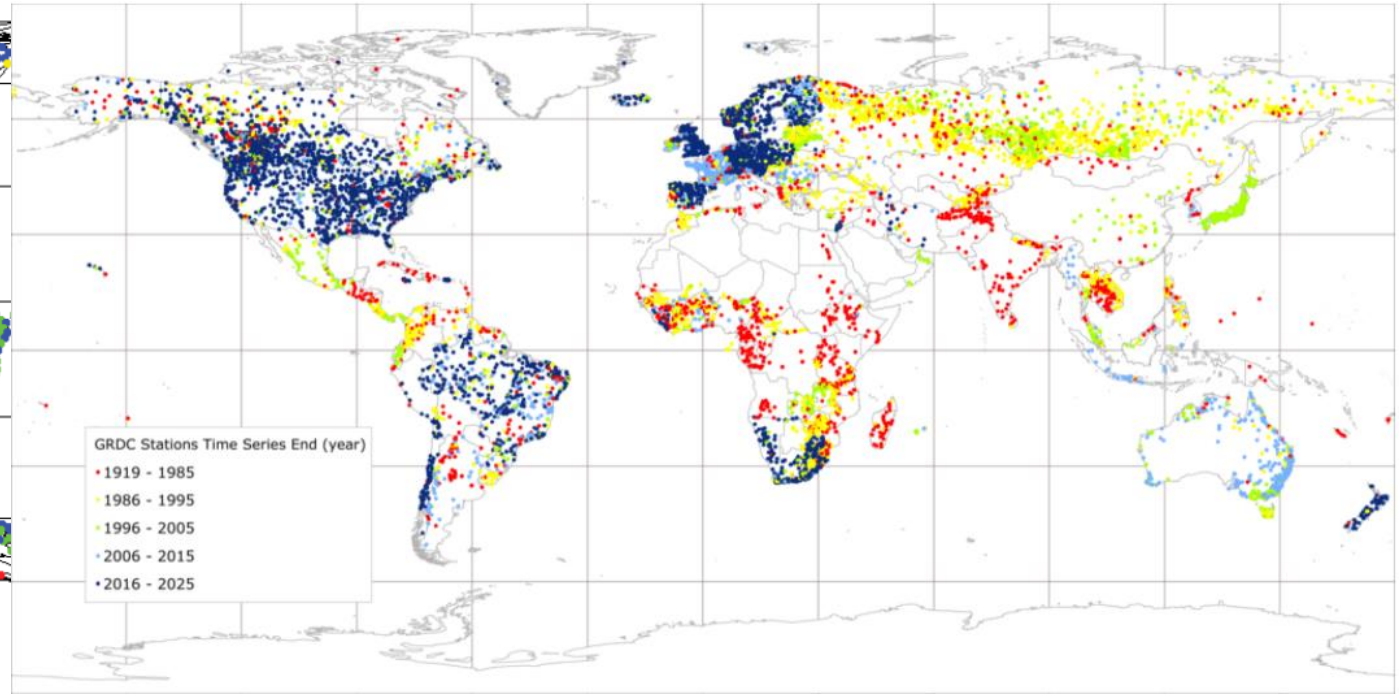
Problems:

1). Reduction in the number of observation resources.





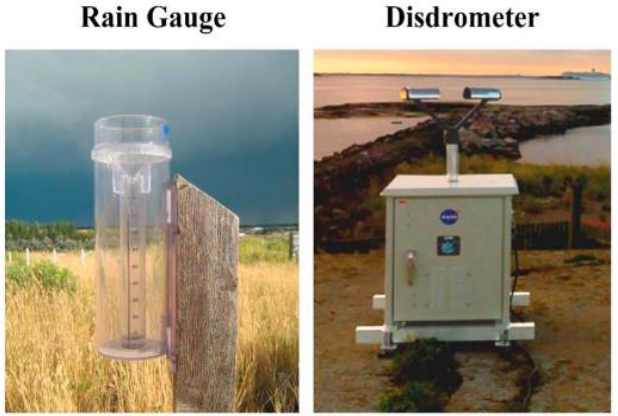




Data collected by： WMO

Sheffield J, Wood E F, Pan M, et al. Satellite remote sensing for water resources management: Potential for supporting sustainable development in data-poor regions[J]. Water Resources Research, 2018, 54(12): 9724-9758.
Ben H.P. Maathuis. Constraints and opportunities for Water Resources Monitoring and Forecasting using the Triple Sensor approach. 2018
https://public.wmo.int/en/resources/bulletin/hydrological-data-exchange

Ground-based rainfall observation



2). Unevenly distribution of observation resources;

WMO Secretary-General Prof. Petteri Taalas:

"In an era of cutting-edge satellite technology and artificial intelligence, there are countries which still lack basic rain gauges"

Shortcomings: insufficient spatial representation

Remote Sensing-based rainfall observation

Radar & Satellite

Shortcomings:

1) need for ground-based measurements for correction
2) not satisfied for the fast hydrological response applications

Lack Spatial and Temporal resolution

Ground-based, low cost, high resolution

WMO, Intergovernmental Hydrological Programme (IHP), NOAA, NASA

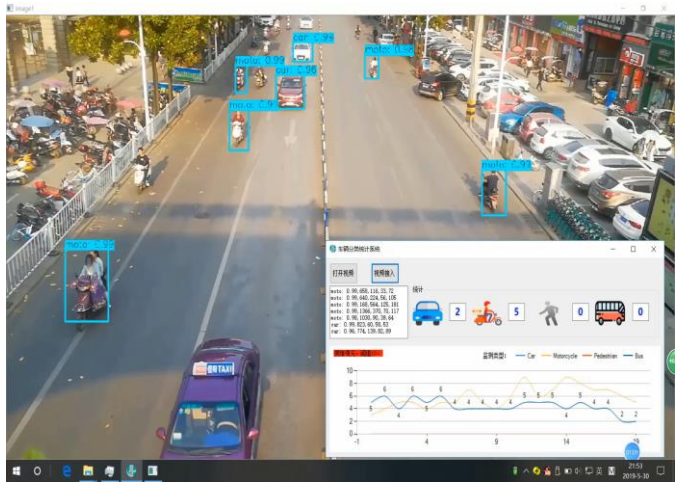
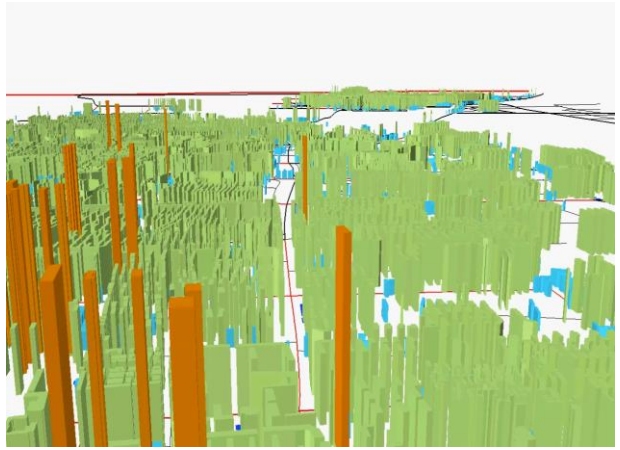
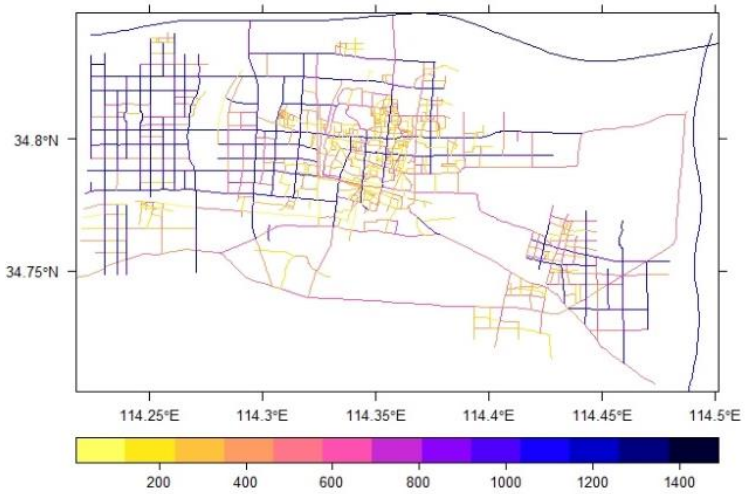
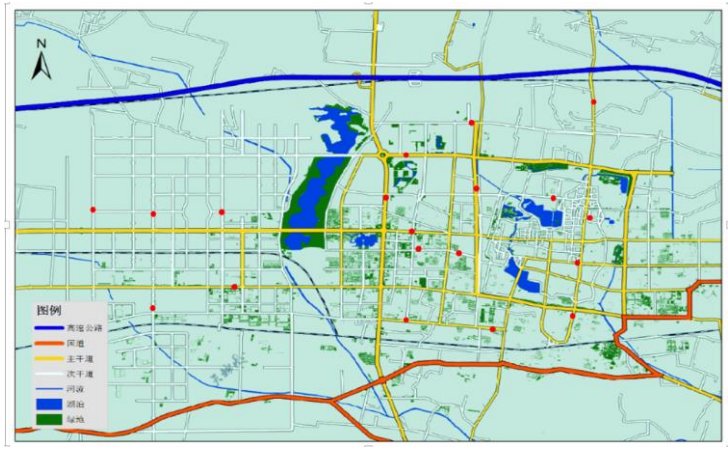
Air pollution modeling in urban street canyons



Vehicles are the main source of air pollution







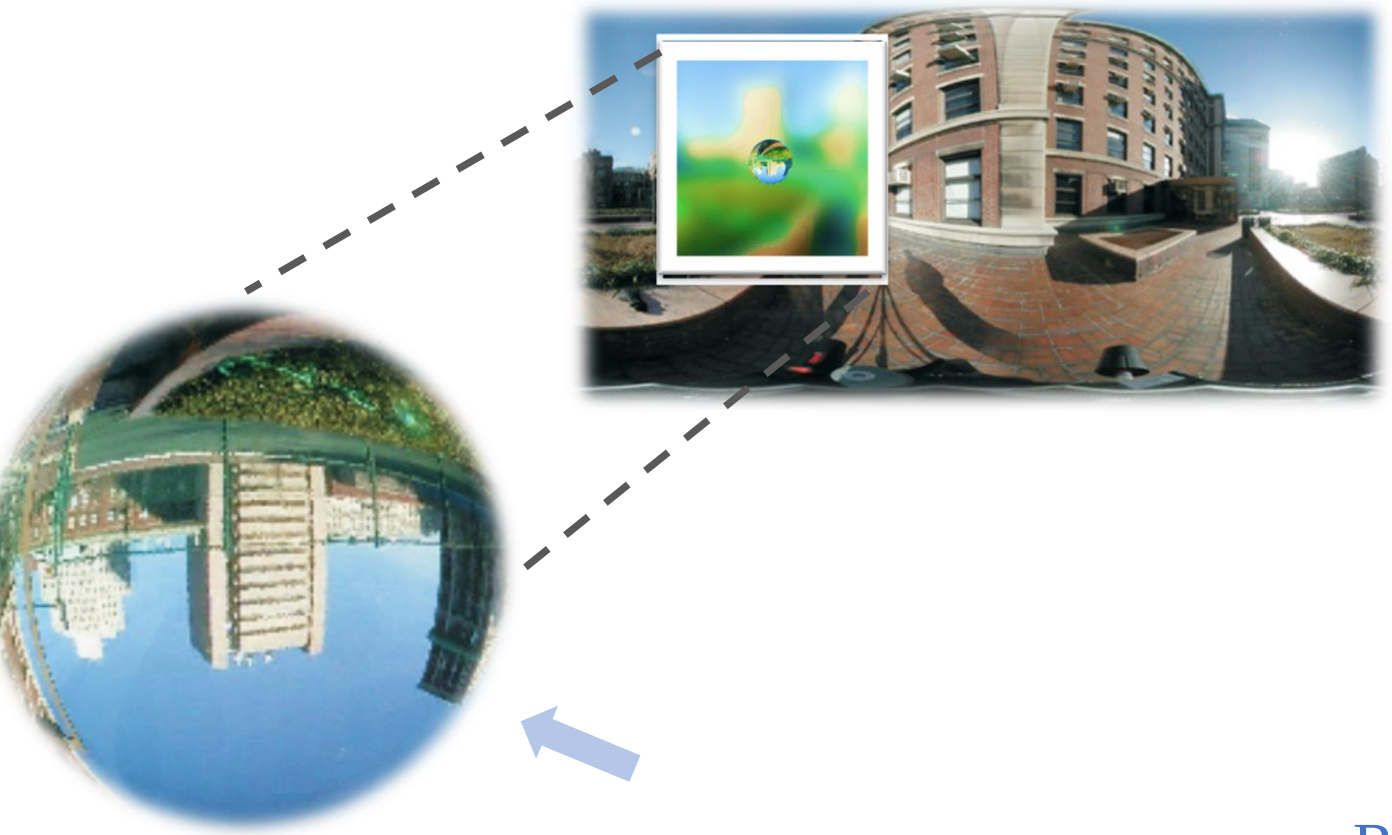
1. Background

2. Video-based rainfall estimation

3. Audio-based rainfall estimation

4. Conclusion

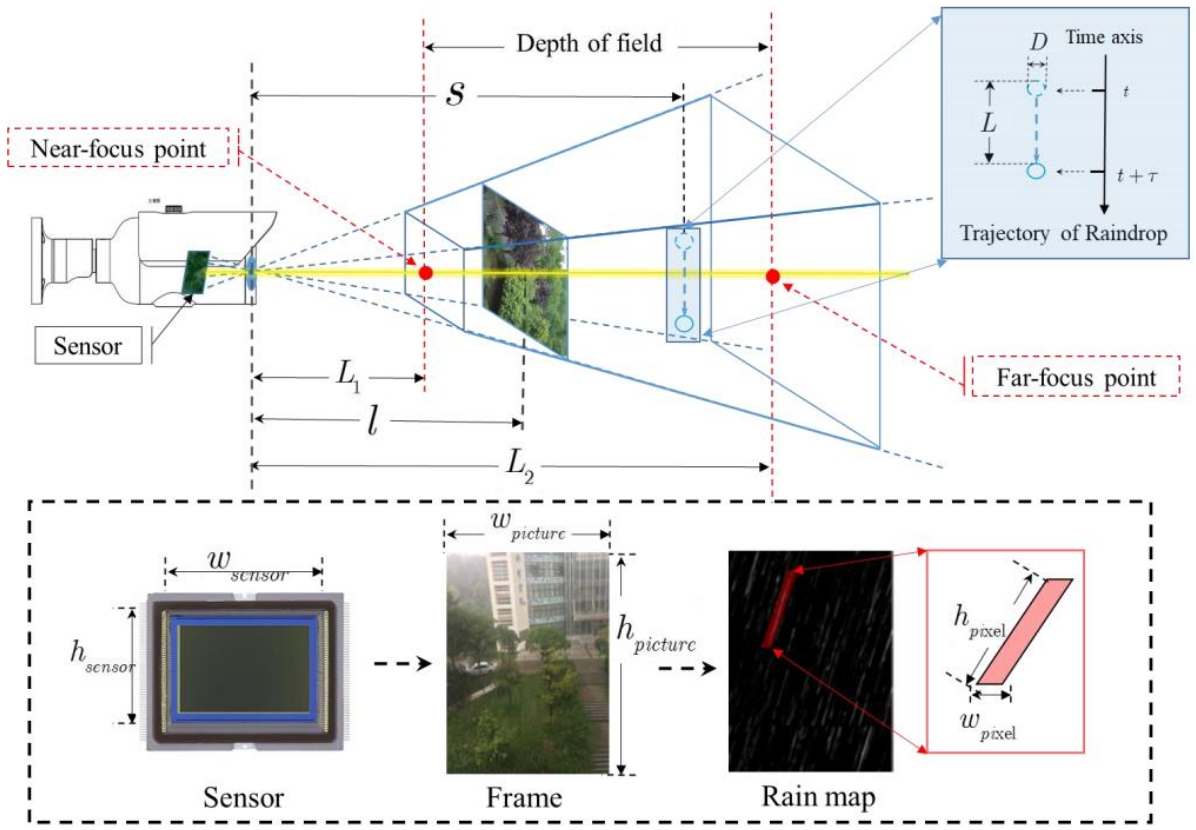
2.1 Rainfall calculation based camera collaboration



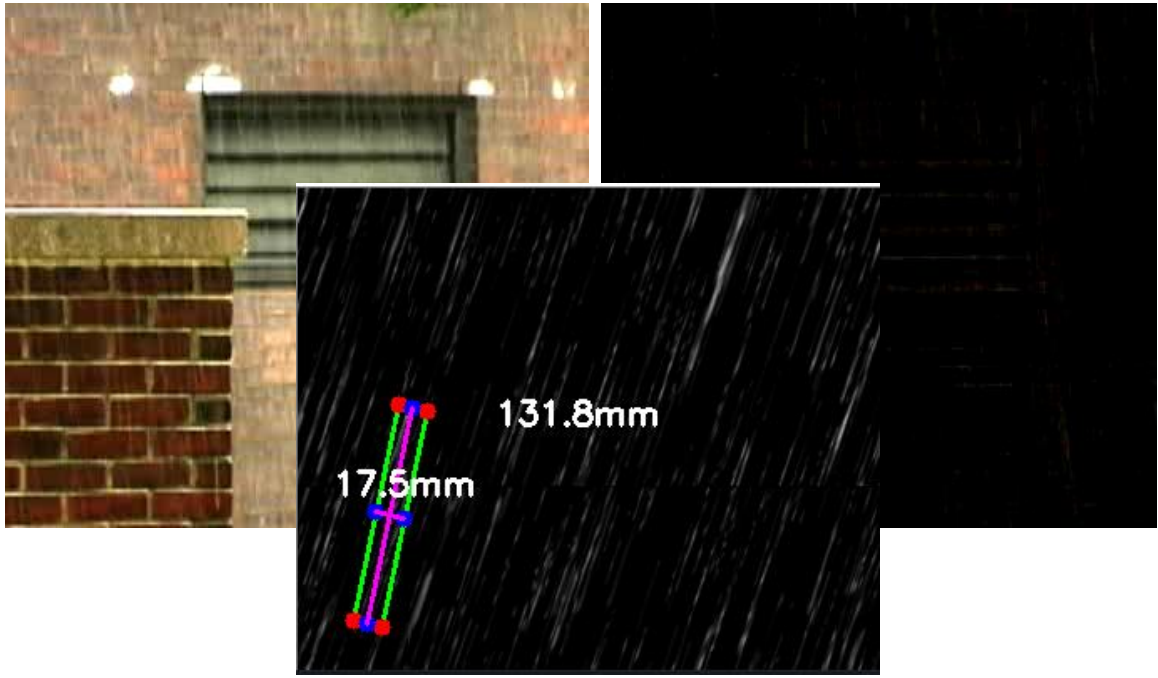
Rain streaks: the blurred pixels by raindrops

Rainfall intensity: is defined as the ratio of the total amount of rain (rainfall depth) falling during a given period. It is expressed in depth units per unit time, usually as mm per hour (mm/h).

2.1 Rainfall calculation based camera collaboration



Camera imaging model
(Pinhole imaging)



Step 1: Rain streaks detection from videos;

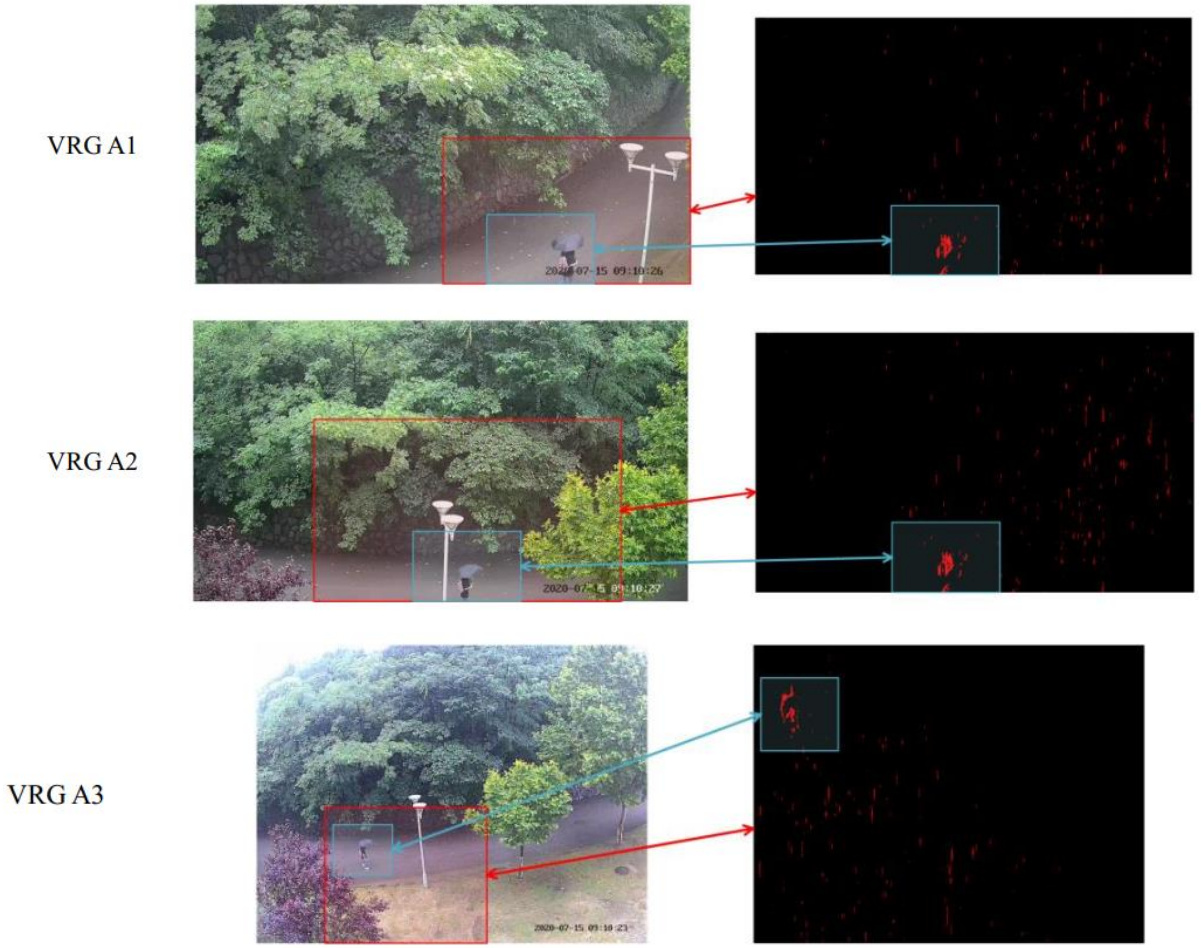
Step 2: Raindrop size and speed calculation;

Step 3: Rainfall intensity estimation.

rain streaks: the blurred pixels by raindrops

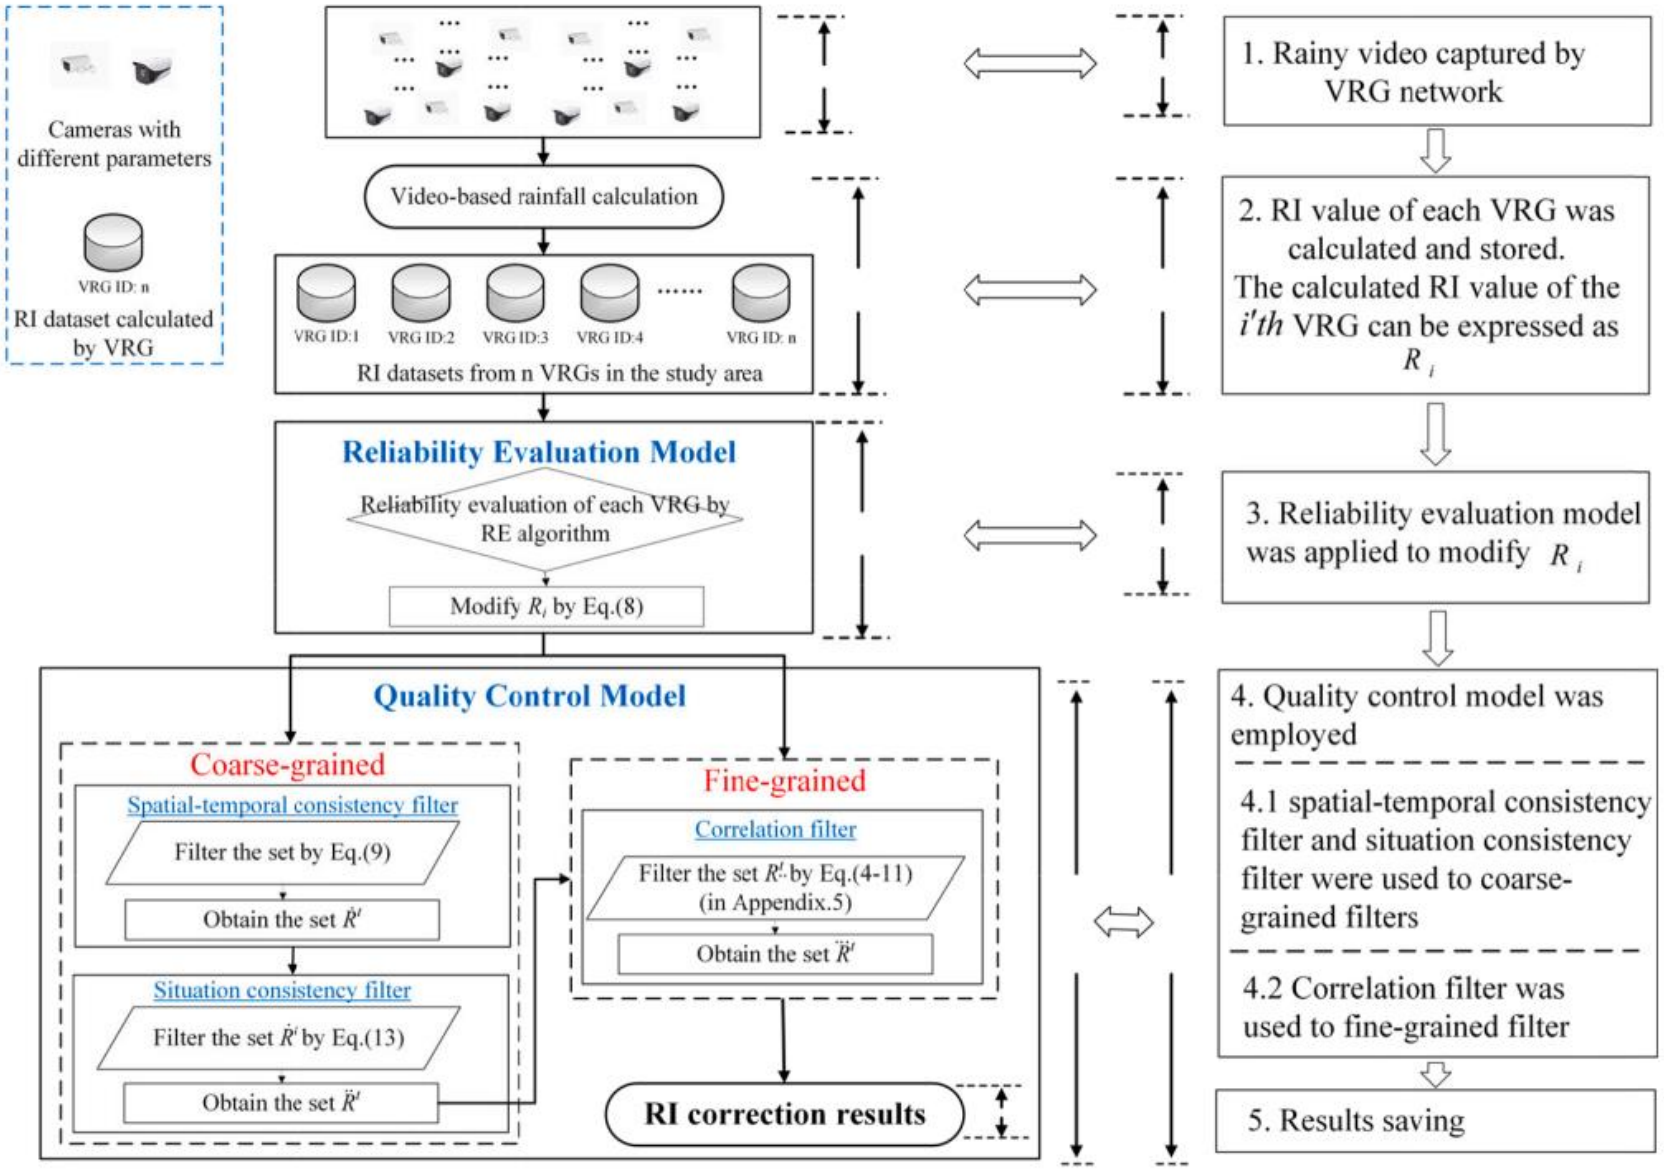
Shortcomings of surveillance Video-based Rain Gauge (VRG):

Non-cooperative surveillance scenarios

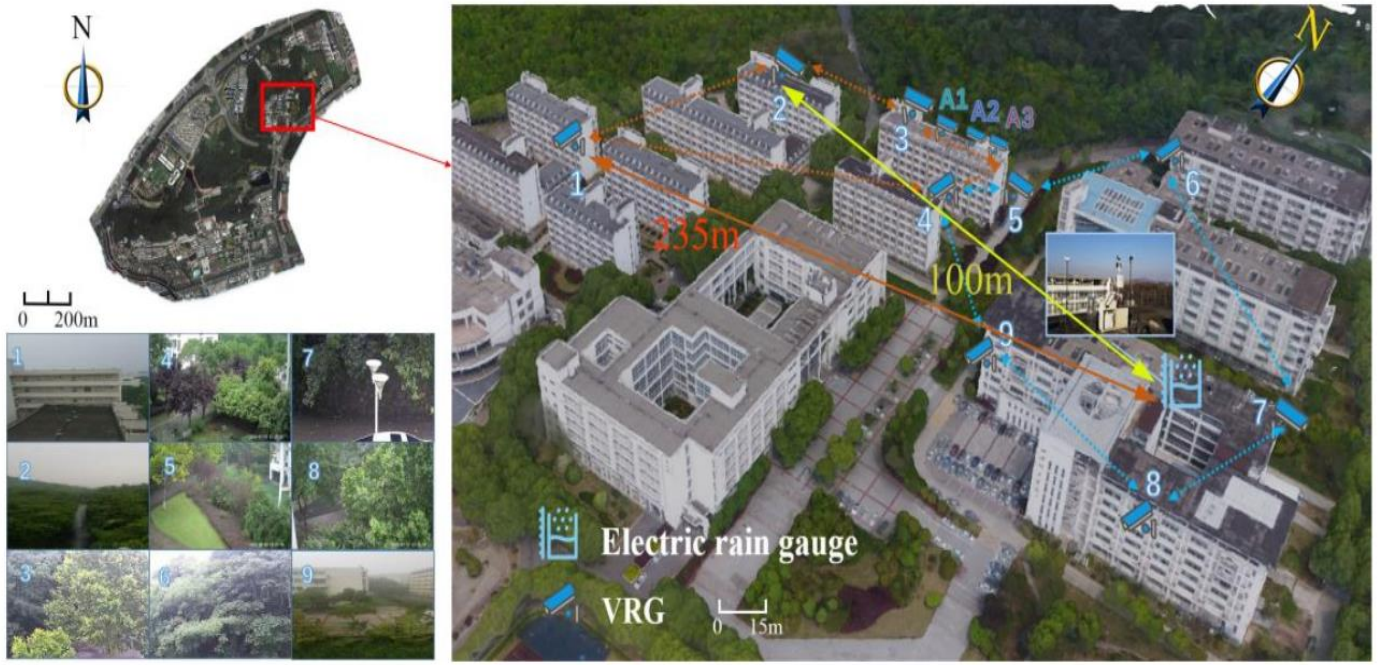


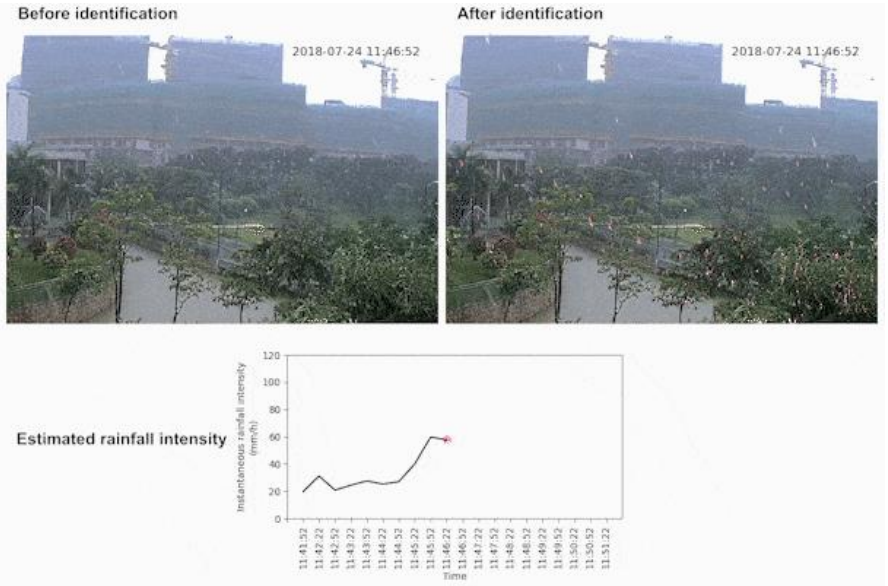
Moving objects

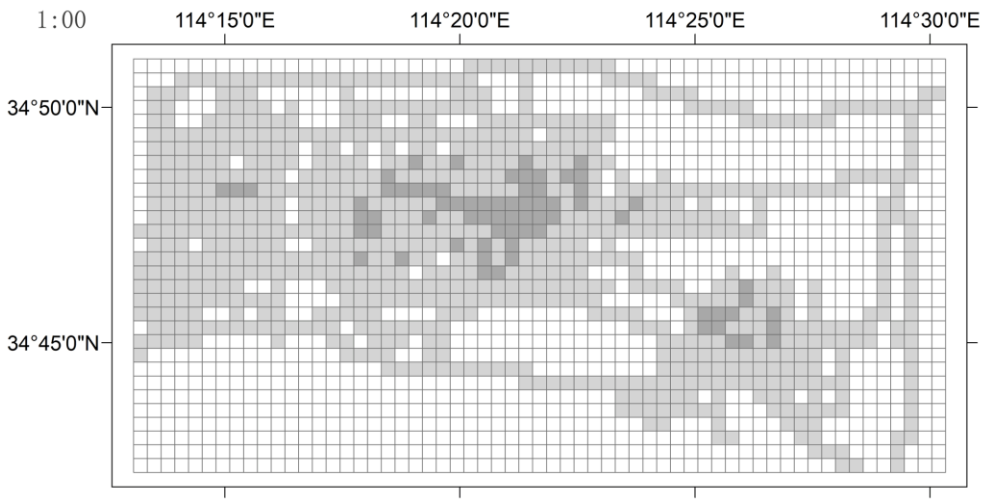
Precision control model of rainfall inversion based on VRGs collaboration:



Experiments (in Nanjing Normal University)

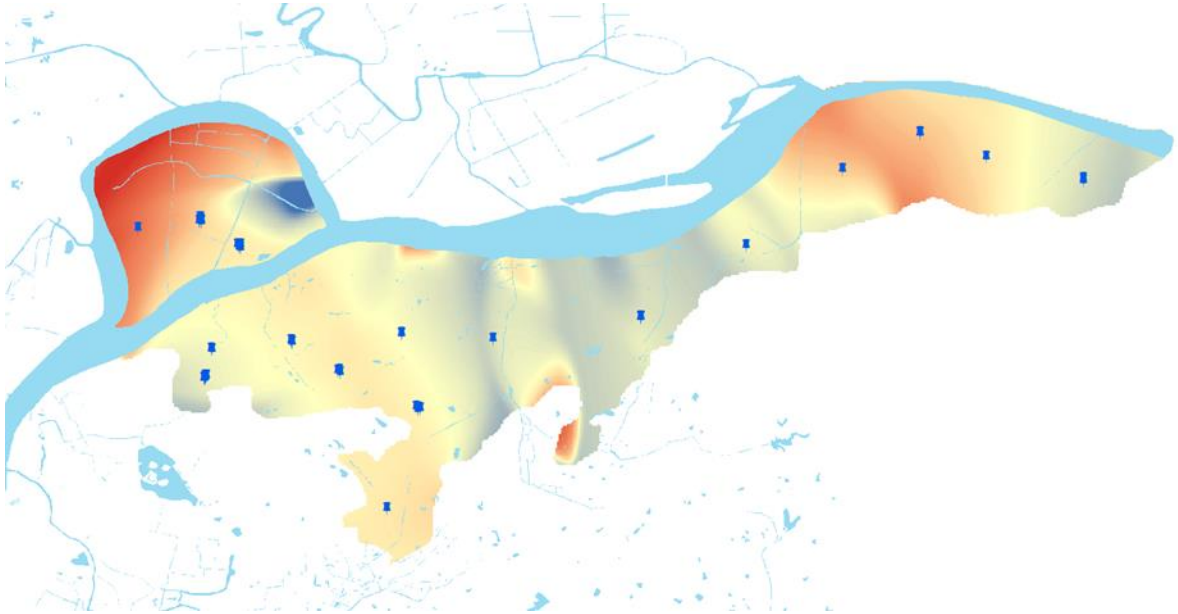


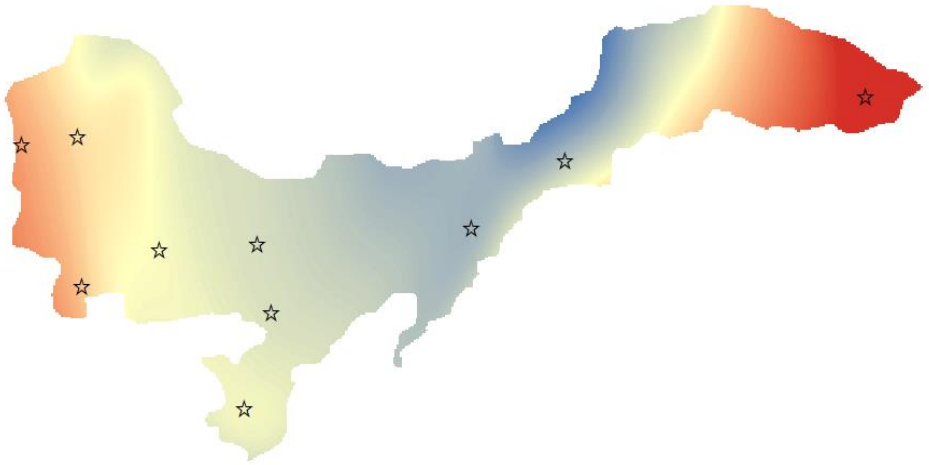


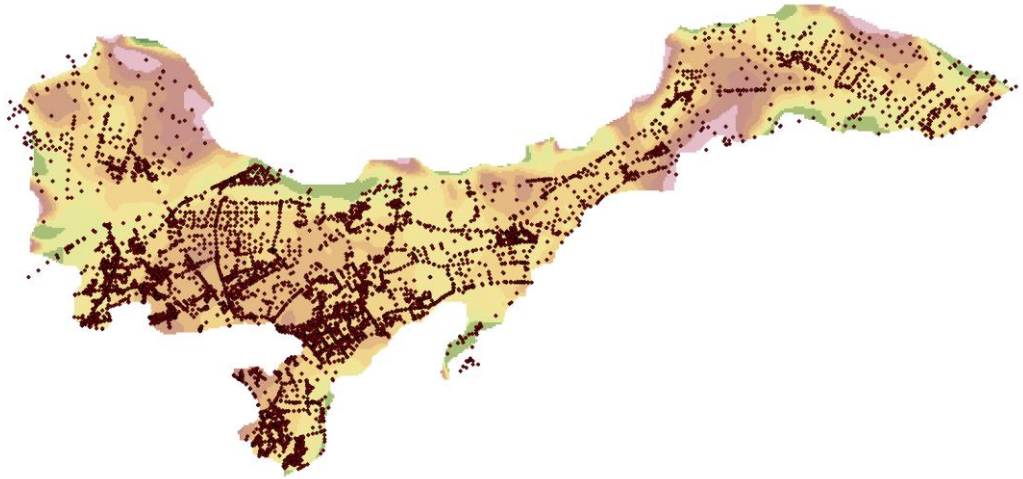


Wang X, Wang M, Liu X, et al. A novel quality control model of rainfall estimation with videos–A survey based on multi-surveillance cameras[J]. Journal of Hydrology, 2022, 605: 127312.

Simulation Experiments (in Nanjing)







Wang X, Wang M, Liu X, et al. A novel quality control model of ra
estimation with videos–A survey based on multi-surveillance cameras[J].
Journal of Hydrology, 2022, 605: 127312.

1. Background

2. Video-based rainfall estimation

3. Audio-based rainfall estimation

4. Conclusion

3.1 Parallelizing rainfall level classification network

Rainfall Events	Chroma	Tonnetz	C	MFCC	Mel
Violent					Heavy					Middle					Small					No-Rain					
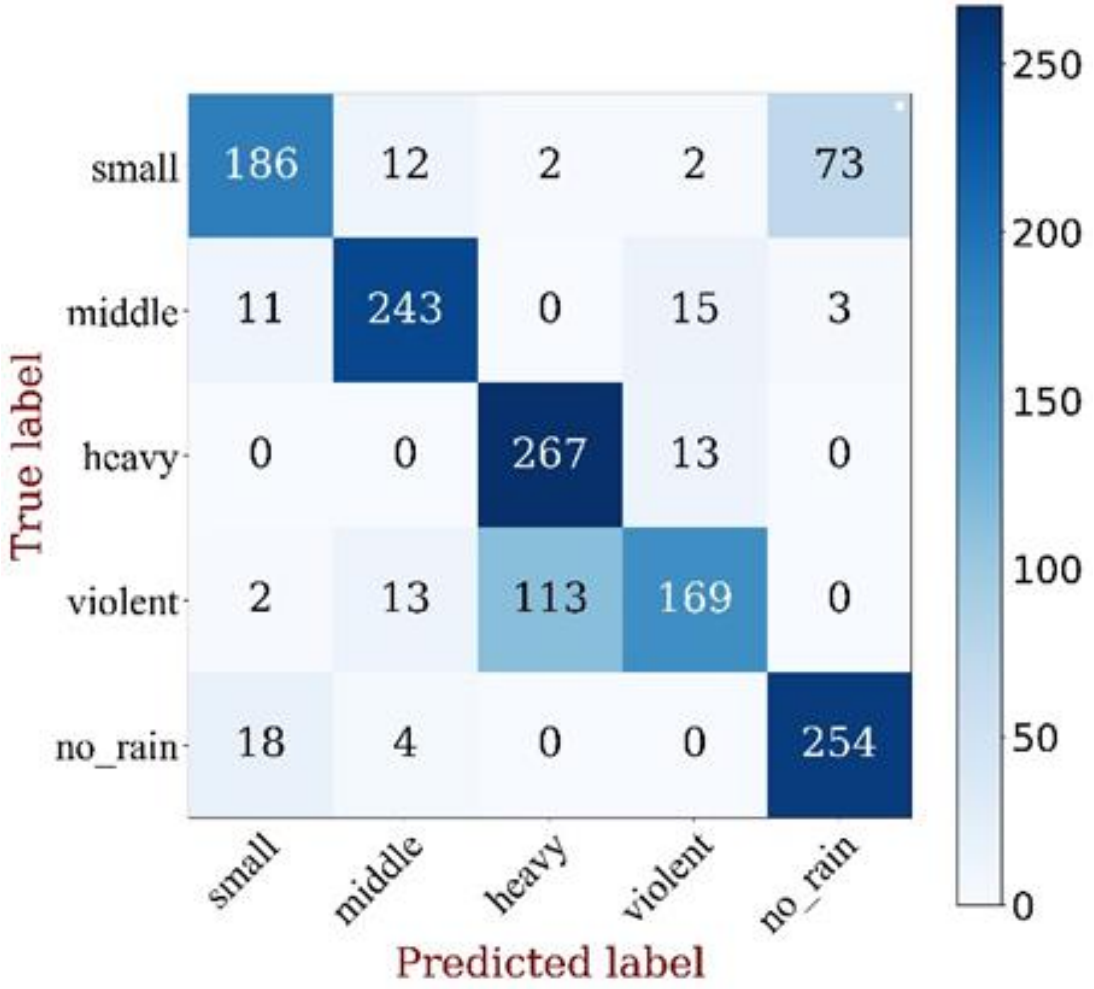
(i) The acoustic features of different rainfall-level audio are similar;

(ii) Background noise in surveillance sound space significant.

3.1 Parallelizing rainfall level classification network

(i) The proposed algorithm achieves optimal performance compared to some existing relevant models, indicating that the proposed algorithm can effectively determine the rainfall level from ordinary surveillance audio.

(ii) However, there is still much room for enhancing. In particular, the classification of “no_rain” and “small rain” scenarios and the distinction of “violent rain” and “heavy rain” need to be improved.



Wang X, Wang M, Liu X, et al. Rainfall observation using surveillance audio[J]. Applied Acoustics, 2022, 186: 108478.
