What are the challenges to genome stability?

What is more prevalent? Exogenous or endogenous damage?

Even-though, historically, exogenous DNA damage was considered to be the prime cause of mutagenesis, recently, as the methodology has progressed, the cellular DNA metabolism pathways (replication and transcription) are being recognised as the more prevalent cause of mutations.

What are the challenges to genome stability?

Inability to repair properly the damage may lead to cancer, senescence, or apoptosis.

Transient summary II

Transient summary II

Cells possess specific factors - sensors - that recognise insults to DNA structure, DNA breaks, or stalled machineries like transcription and replication.

Transient summary II

Cells possess specific factors - sensors - that recognise insults to DNA structure, DNA breaks, or stalled machineries like transcription and replication.

The sensors subsequently activate complex signalling pathways that lead to halt of cell-cycle, as well as to decision as of which pathway is to be used; balancing the cell-cycle stage and other needs of the cell.
