03 Climatological data

Jan Řehoř, MSc, PhD

Content

- 1. Global observing system**
- 2. Atmospheric reanalysis**
- 3. Climatological data sources**
- 4. Climate data processing**
- 5. Climate normals**
- 6. Climate data visualization**

Atmospheric data acquisition

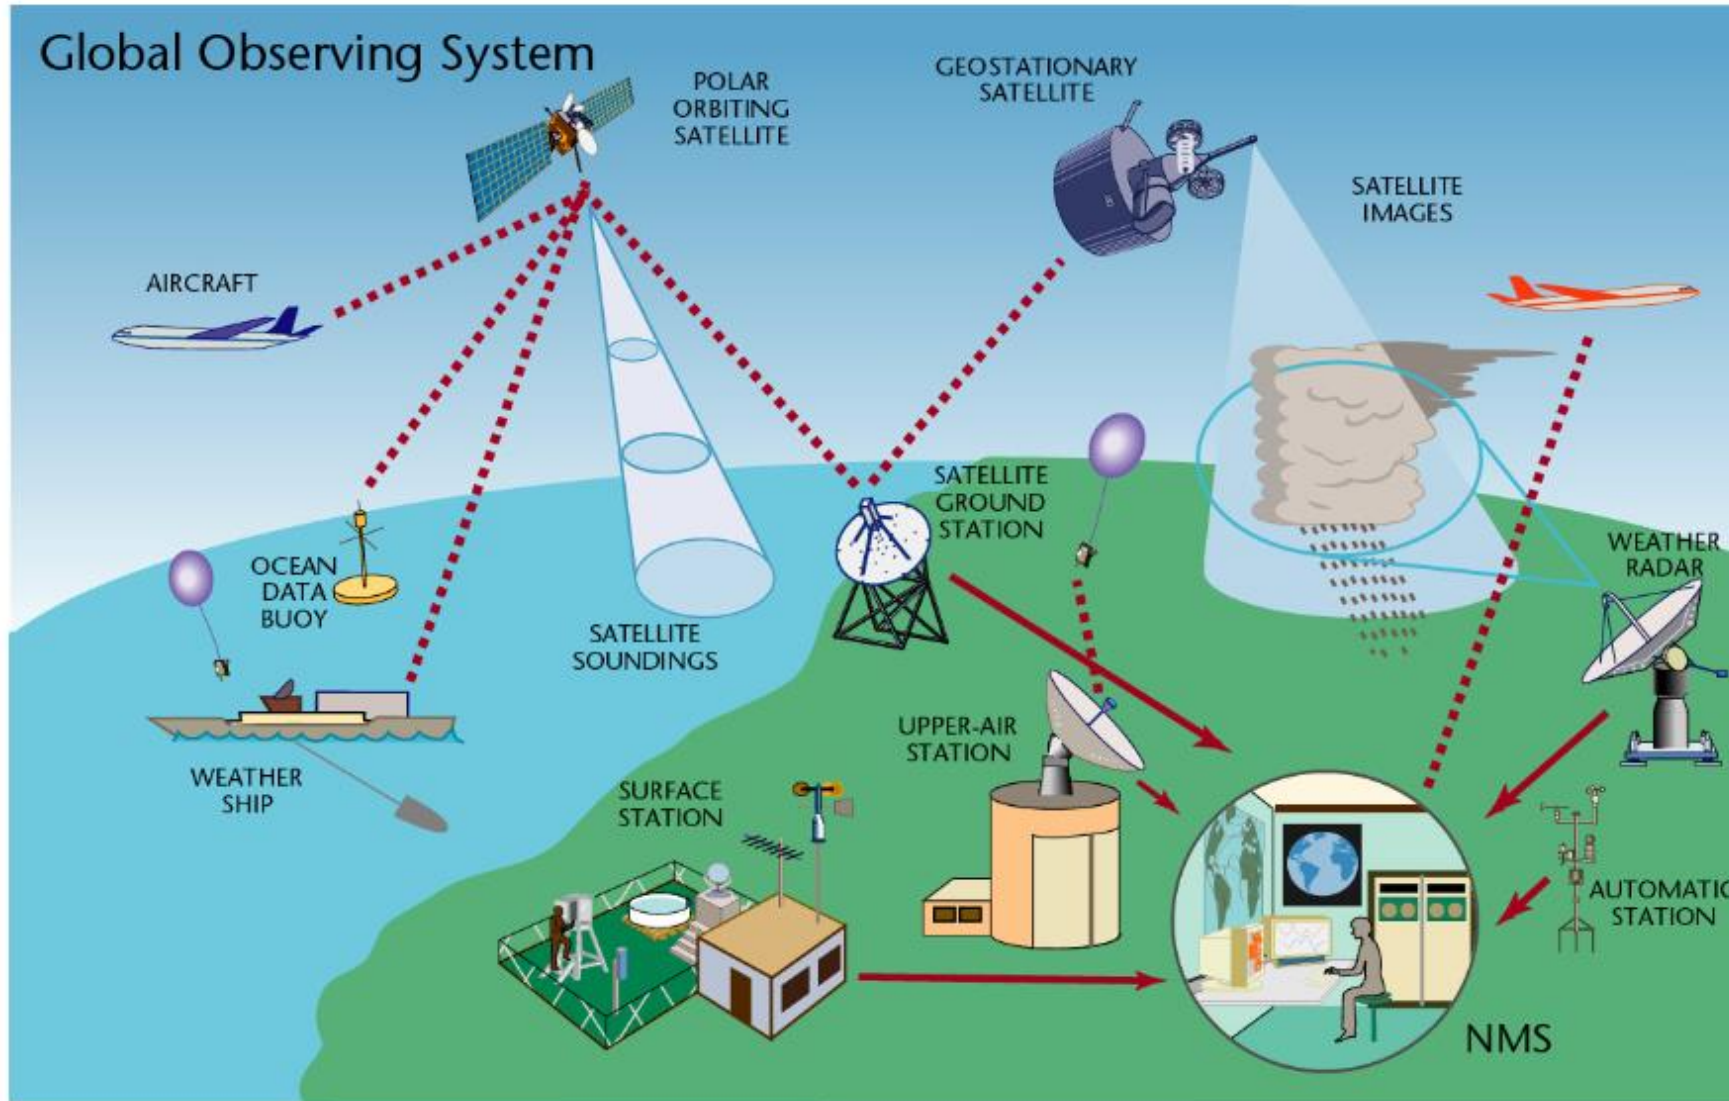

- **Remote sensing**

- Meteorological satellites (polar orbits / geostationary)
- Weather radars
- Lightning detection
- Weather balloons – radiosondes
- Aircraft

- **Surface weather observations**

- Weather station (manual / automated weather station)
- Ocean data buoys, ships, etc.

Global observing system

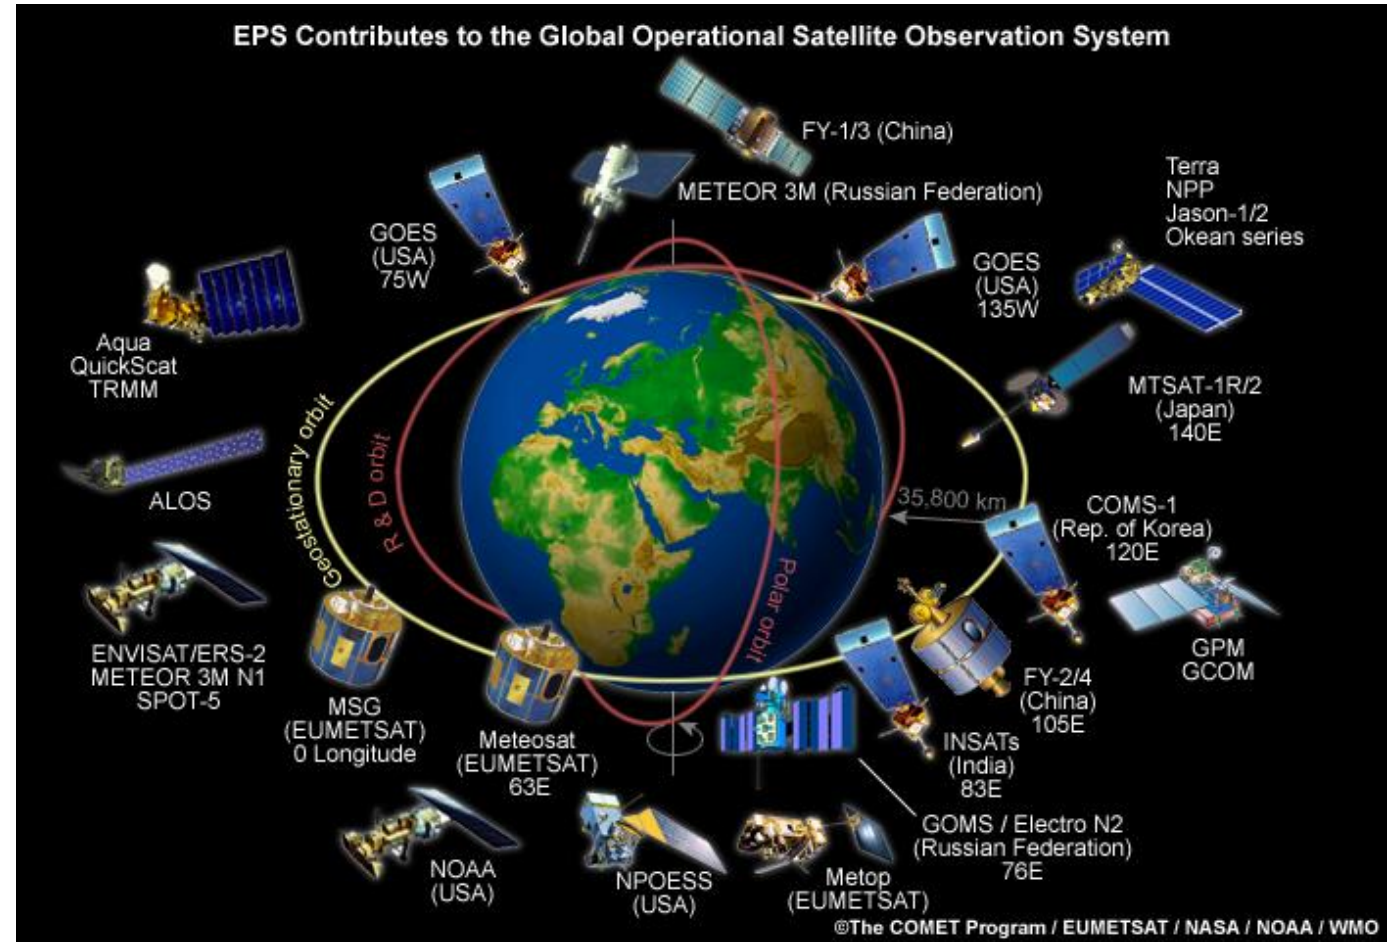

- remote sensing observations
- surface weather observations (in situ)

Observations from space – weather satellites

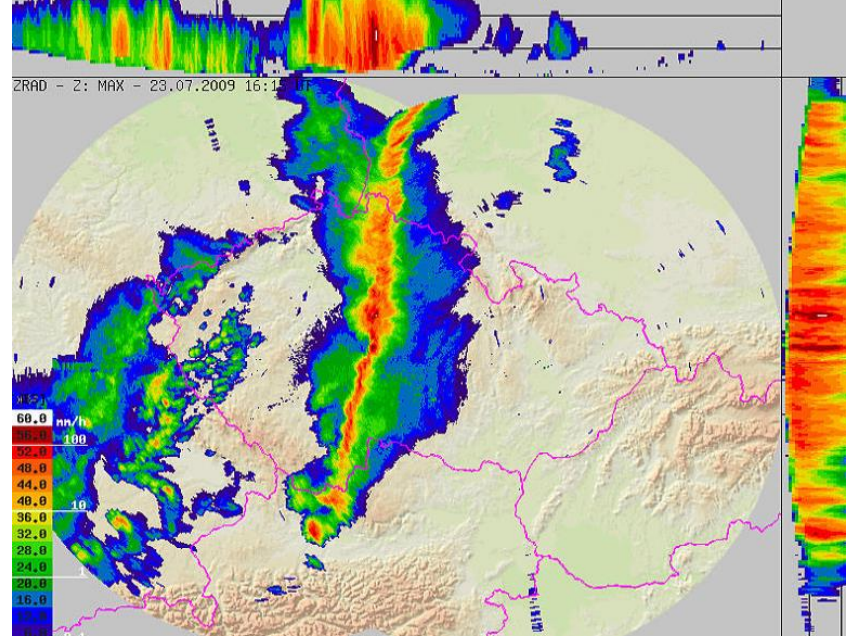

- Geostationary satellites
 - 35,785 km
 - Static position
- Polar orbiting satellites
 - Meridional tracks
 - Lower 100s of km

Category 5 Hurricane Iota seen from GOES-16 (GOES East) on November 16, 2020.

Weather radars + lightning detection

CENTRAL EUROPEAN LIGHTNING DETECTION NETWORK	
CG+	102
CG-	916
CC	507
SUM	1525

Data (c) Global Atmospheric Inc. USA & Siemens AG Germany
Visualisation (c) Czech Hydrometeorological Institute
<http://www.chmi.cz/meteo/rad/blesk/>

Weather balloons - radiosondes

- air temperature, air pressure, relative humidity, wind speed and direction (+ ozone, radioactivity)

<https://www.noaa.gov/jetstream/upperair/radiosondes>

http://portal.chmi.cz/files/portal/docs/meteo/oa/ptu_grafy.html

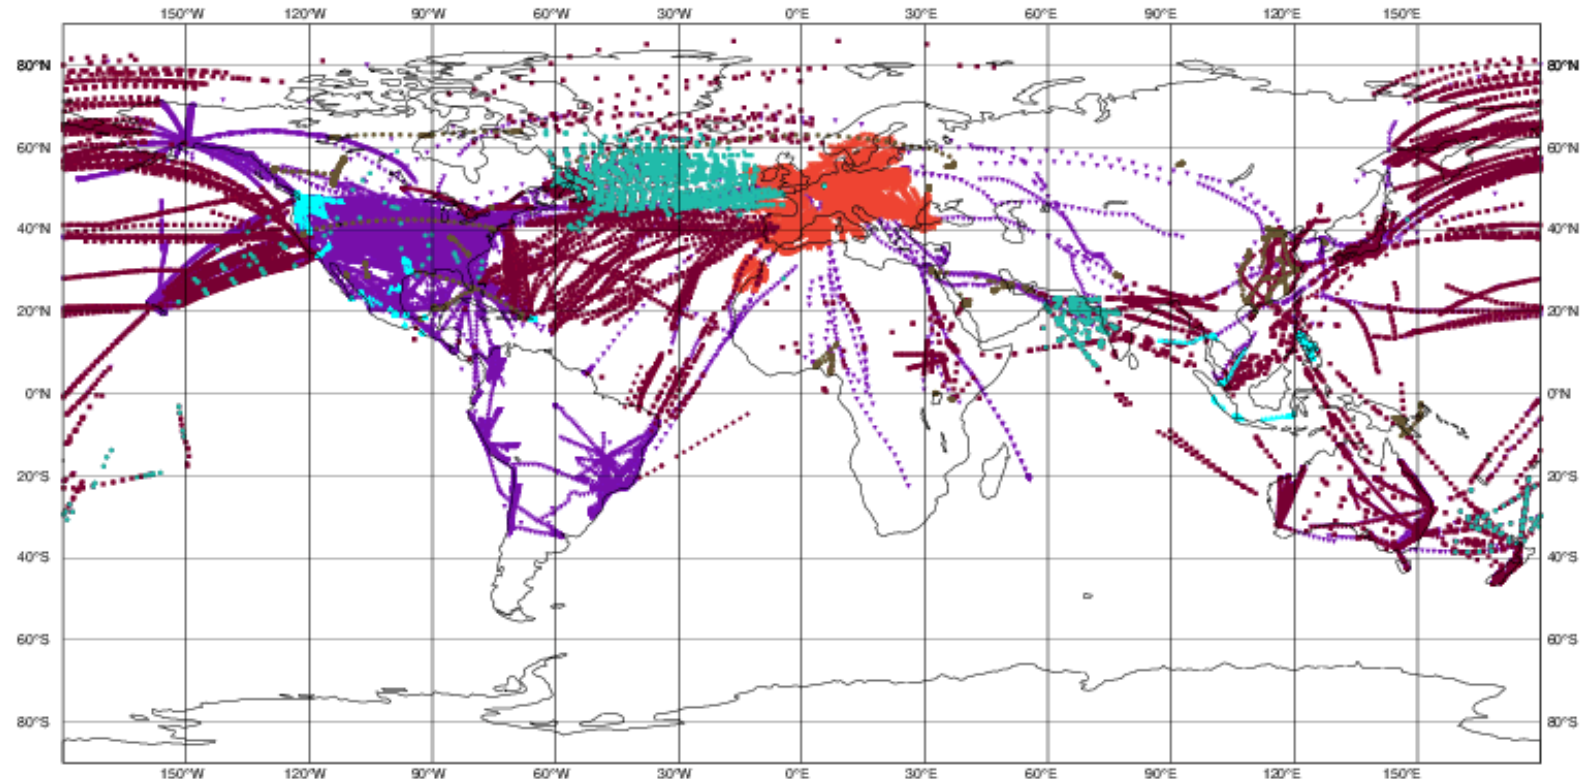

Aircraft-based observations

- upper-air monitoring of the atmosphere
- vertical profiles of temperature, wind, (and moisture)

ECMWF data coverage (used observations) - AIRCRAFT

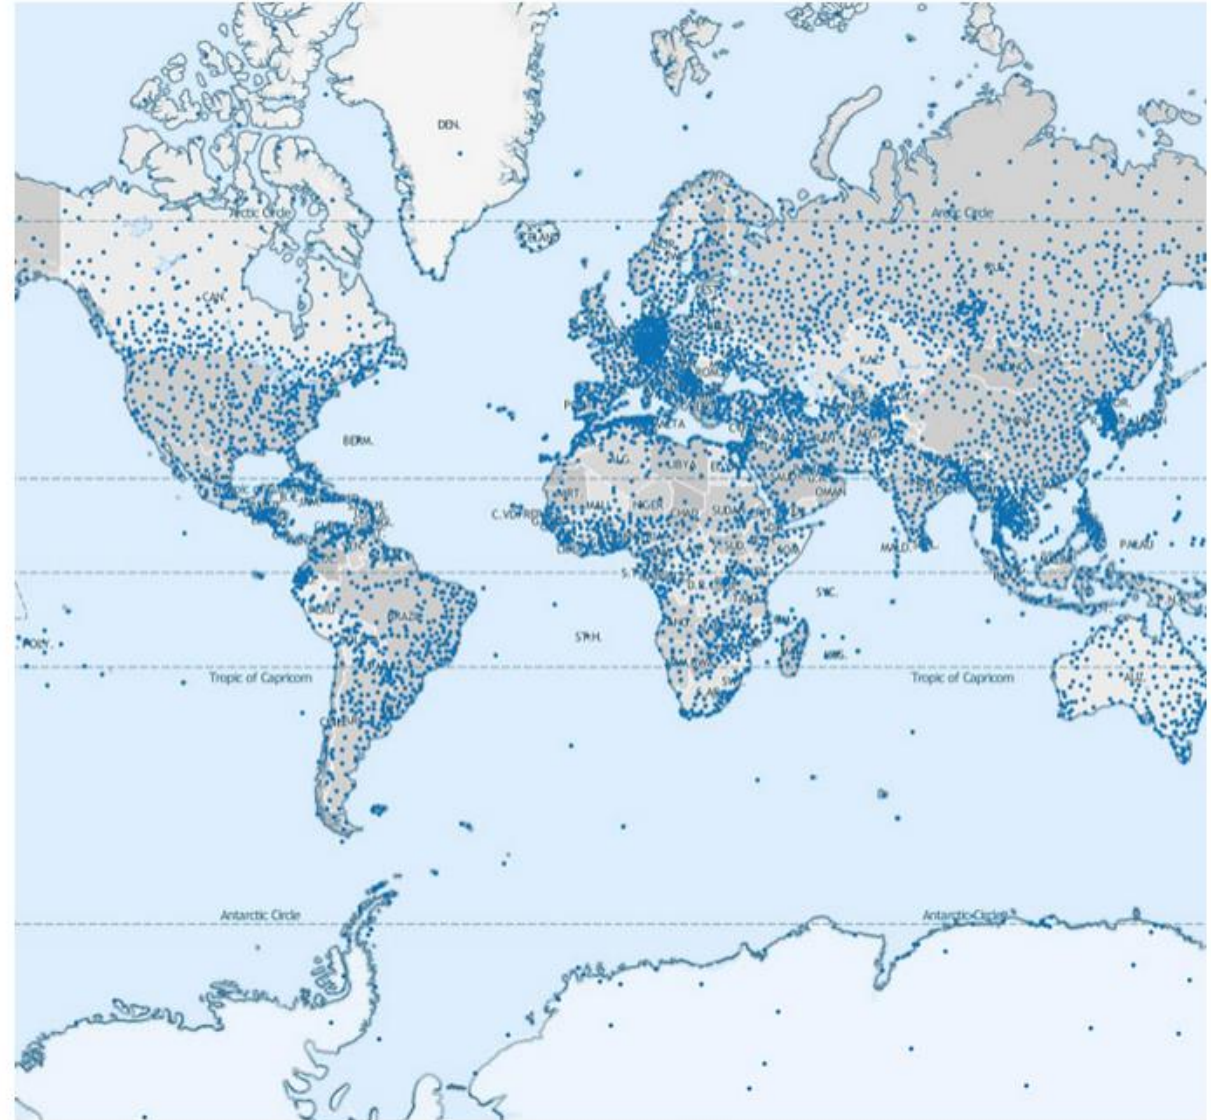

03/12/2020 00

Total number of obs = 162413

Surface observations – meteorological stations

- basic meteorological elements and weather phenomena
- 11,000+ professional stations on earth

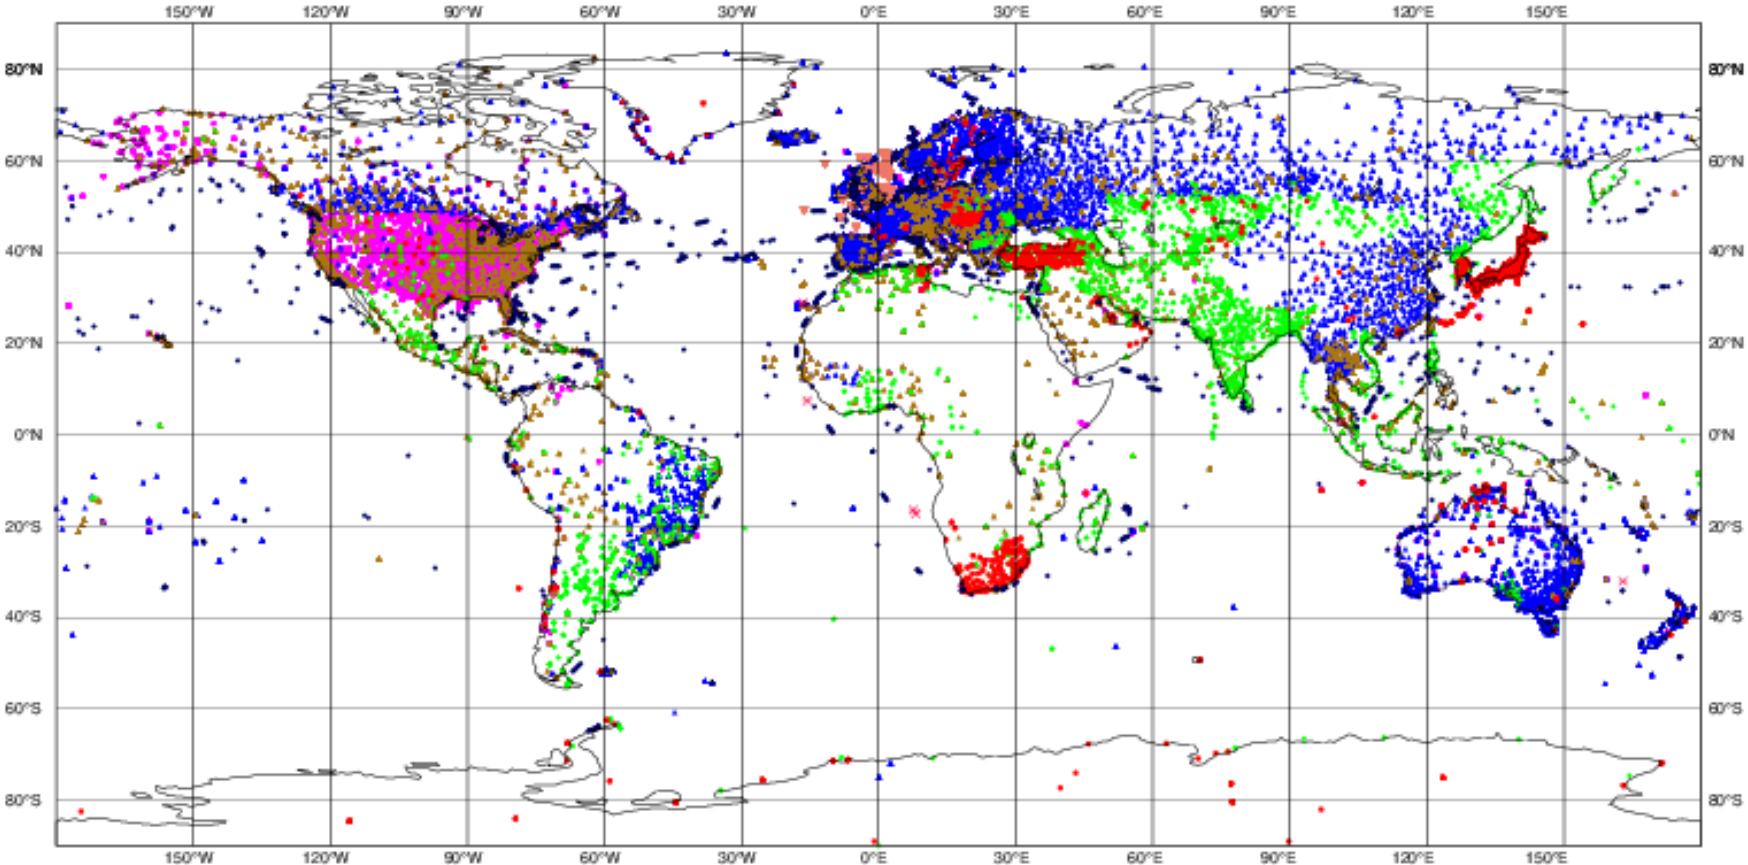

Surface observations – meteorological stations

ECMWF data coverage (used observations) - SYNOP-SHIP-METAR

03/12/2020 00

Total number of obs = 75614

- Automatic Land SYNOP (2482)
- ◆ Manual Land SYNOP (3245)
- ▲ METAR (16138)
- ▼ Automatic SHIP (505)
- ✕ SHIP (6)
- Abbreviated SHIP (0)
- Automatic METAR (27552)
- ◆ BUFR SHIP SYNOP (2141)
- ▲ BUFR LAND SYNOP (23545)

Marine observations

- ships
- moored and drifting buoys
- stationary platforms

Main in situ Elements of the Global Ocean Observing System

October 2017

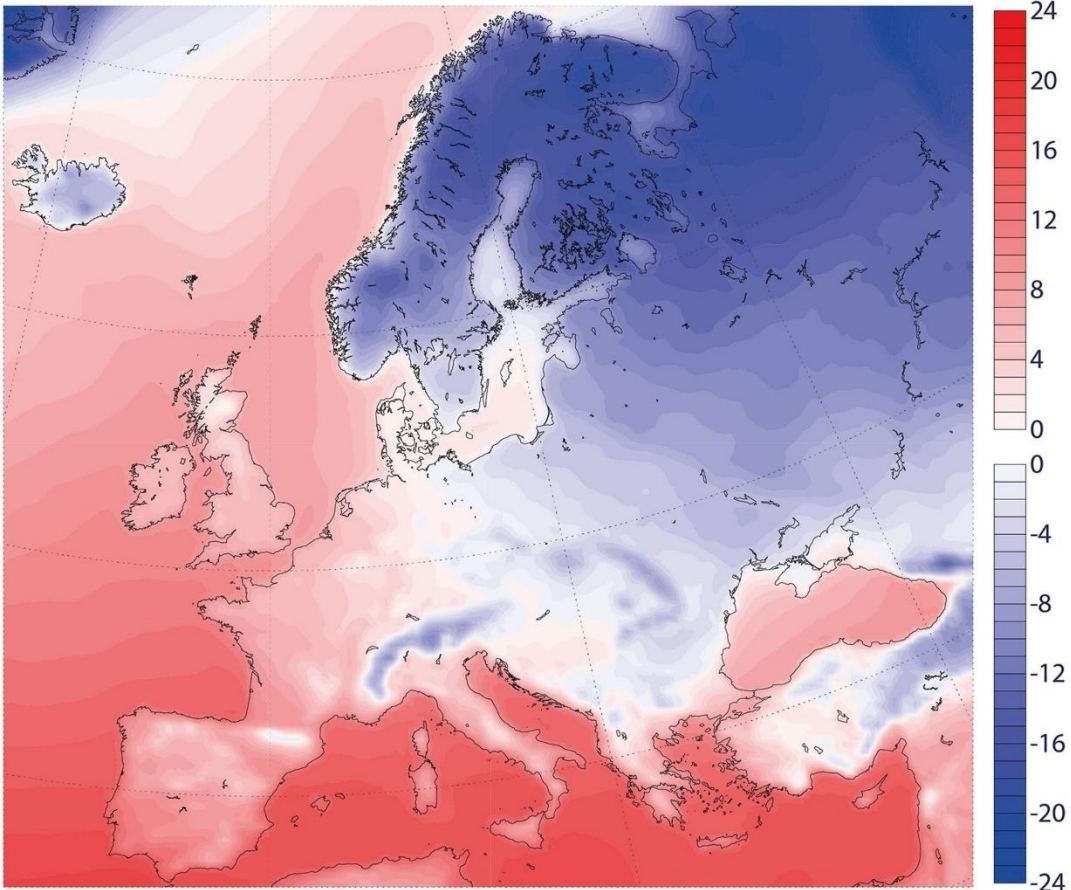

Profiling Floats (Argo)	Data Buoys (DBCP)	Timeseries (OceanSITES)	Ship based Measurements (SOT)
• Core (3836)	• Surface Drifters (1386)	• Interdisciplinary Moorings (332)	• Automated Weather Stations (247)
• Deep (39)	• Offshore Platforms (103)	• Repeated Hydrography (GO-SHIP)	• Manned Weather Stations (1601)
• BioGeoChemical (287)	• Ice Buoys (15)	• Research Vessel Lines (61)	• Radiosondes (19)
	• Moored Buoys (399)	• Sea Level (GLOSS)	• expendable BathyThermographs (37)
	• Tsunameters (37)	• Tide Gauges (252)

Atmospheric reanalysis

Daily mean temperature for January 2016 from ERA5

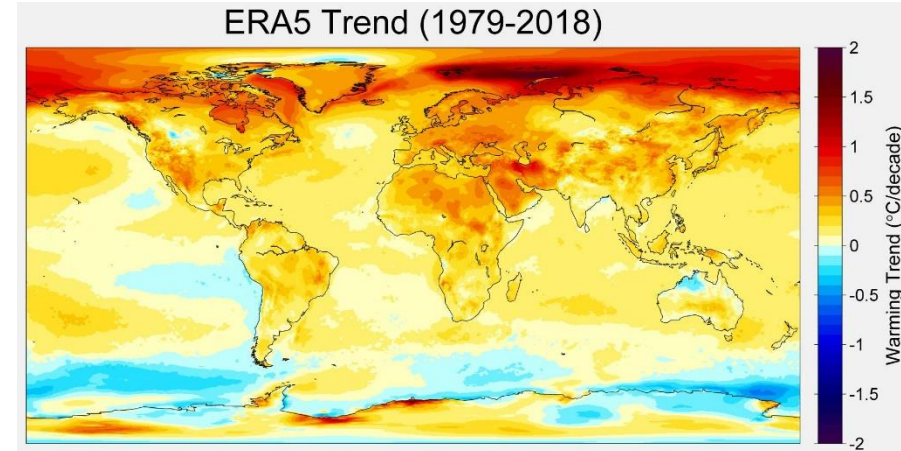

2m Temperature Anomaly (°C)
Annual 2018 - 1979-2000

ECMWF ERA5

Atmospheric reanalysis

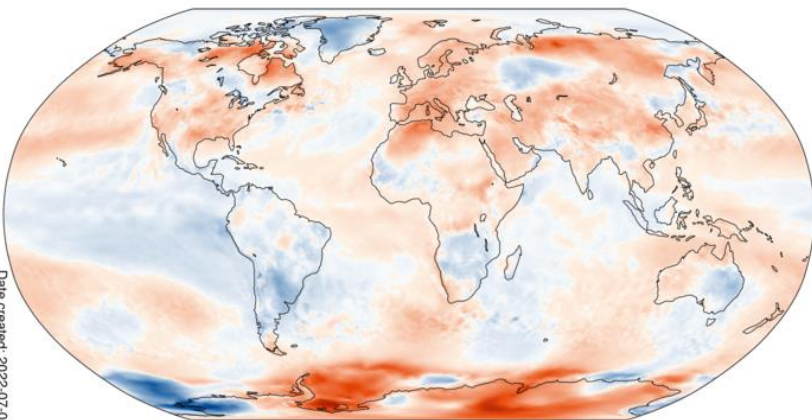

- **Numerical atmospheric model**, similar to numerical **weather forecast models** or **climate models (GCMs)**
- Applied to **already elapsed** time period
- **Assimilation** of measured data:
 - meteorological stations
 - satellite data (since the late 1970s)
 - balloons, ships, aircraft, buoys, ...
- **Data quality control** - elimination of problematic values
- Last decades: several **millions** of values assimilated at each step
- Rapid decline in the amount of data available for assimilation towards the past

Atmospheric reanalysis – advantages

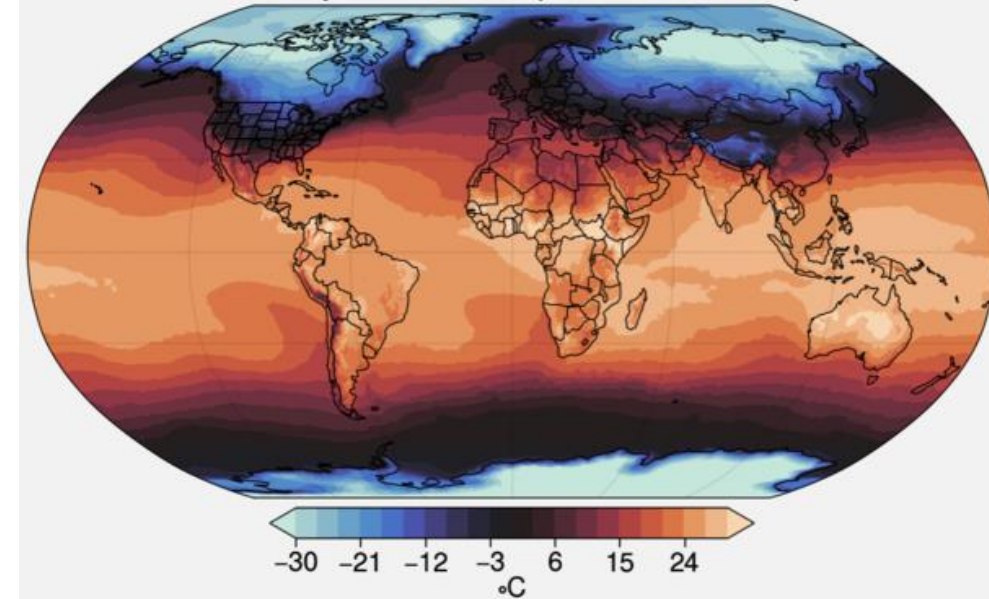

- Data calculated for regions with **low measurement density / absence of measurements**
 - Areas with minimum surface stations
 - Vertical atmospheric layers – minimum amount of measurements
- Calculation of variables which are **not or sparsely measured**
- **Global product** for several decades, same resolution for all regions

Surface air temperature anomaly for June 2022

(Data: ERA5. Reference period: 1991-2020. Credit: C3S/ECMWF)

ERA5 monthly mean 2m temperature - February 2021

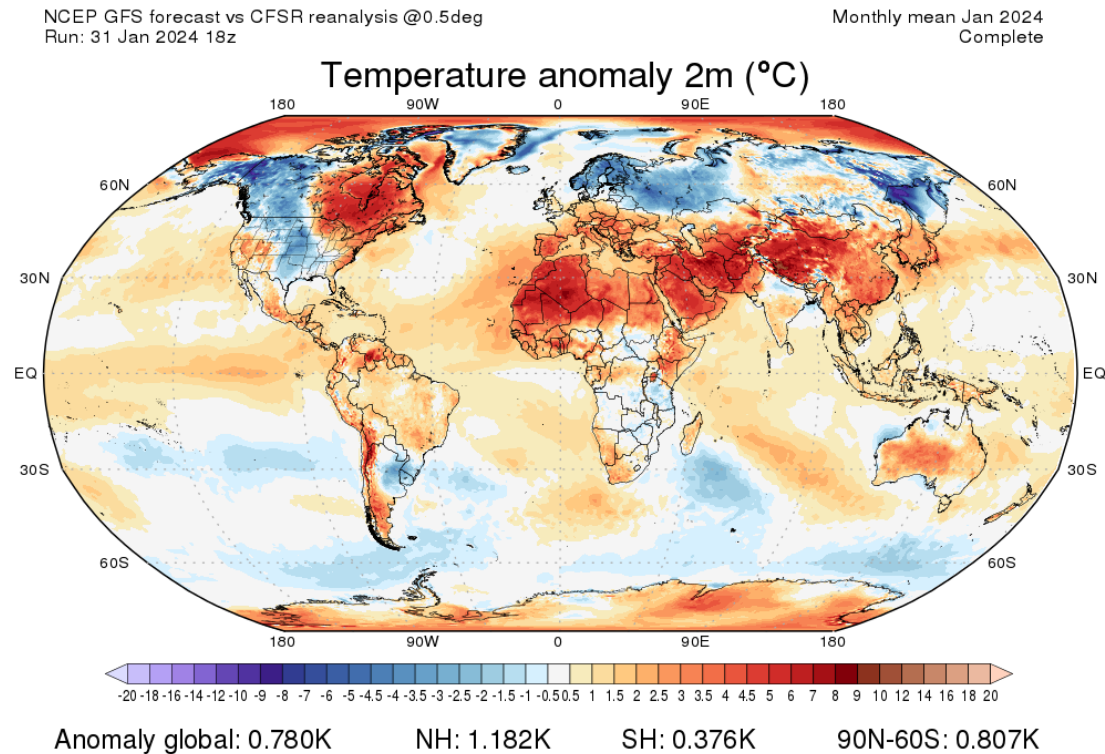

PROGRAMME OF
THE EUROPEAN UNION

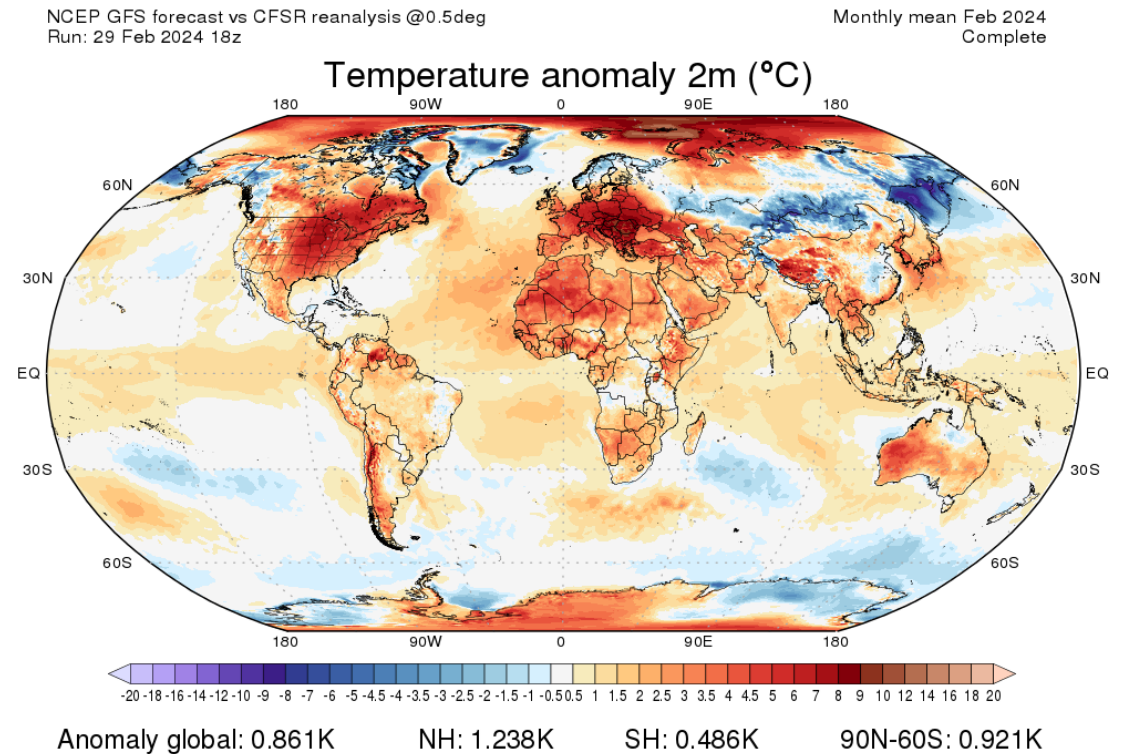

Atmospheric reanalysis – disadvantages

- Lower **spatial resolution** (better for the newest products)
- Spatiotemporal inconsistency in number of assimilated data
- Specific problems from weather forecasting models transferred to reanalysis

(c) Karsten Haustein

Climatology for 1981-2010 reference period (5 day running mean) | GISS adjusted

(c) Karsten Haustein

Climatology for 1981-2010 reference period (5 day running mean) | GISS adjusted

Atmospheric reanalysis – available products

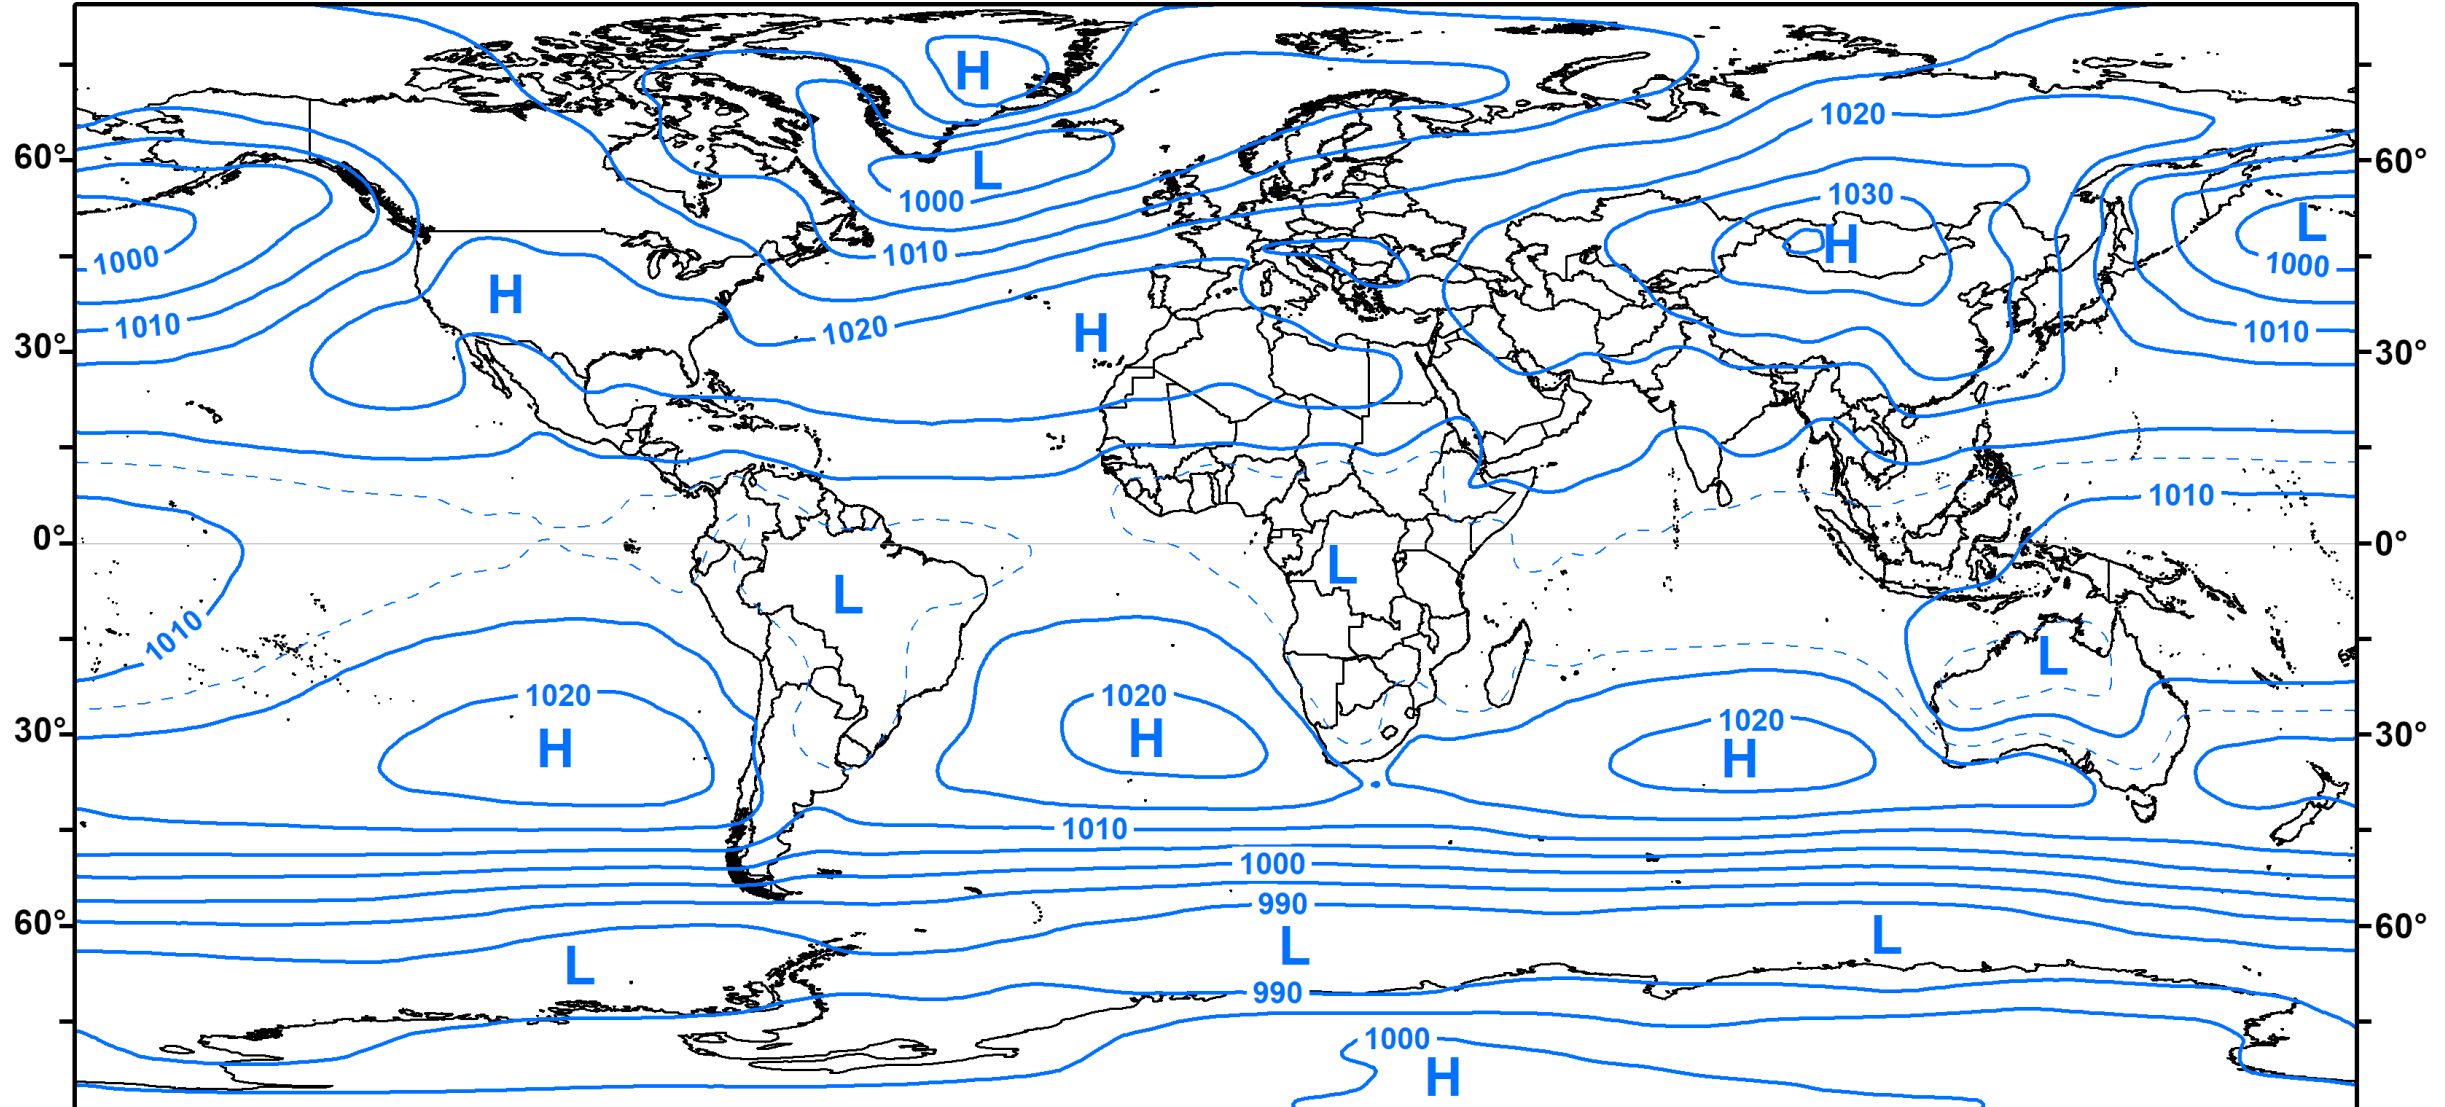

- NCEP/NCAR (National Centers for Environmental Prediction / National Center for Atmospheric Research)
 - 1948–2024 (developer in 1995 but updated), resolution $2.5 \times 2.5^\circ$
- NOAA 20th-Century: 1836–2014 (longest global reanalysis)

ECMWF (European Centre for Medium-Range Weather Forecasts):

- **ERA5**: 1940-2024 (updated constantly), **$0.25 \times 0.25^\circ$** resolution
- **ERA5-Land**: land-surface version of ERA5, **$0.1 \times 0.1^\circ$** resolution (ca 9 km)
- ERA-20C/CERA-20C: 1901-2010, $1.125 \times 1.125^\circ$,
- ***Regional reanalyses***:
 - UERRA/MESCAN-SURFEX, CARRA
 - **CERRA + CERRA-Land**: Europe since 1984, **$0.05 \times 0.05^\circ$** (cca 4.5 km)

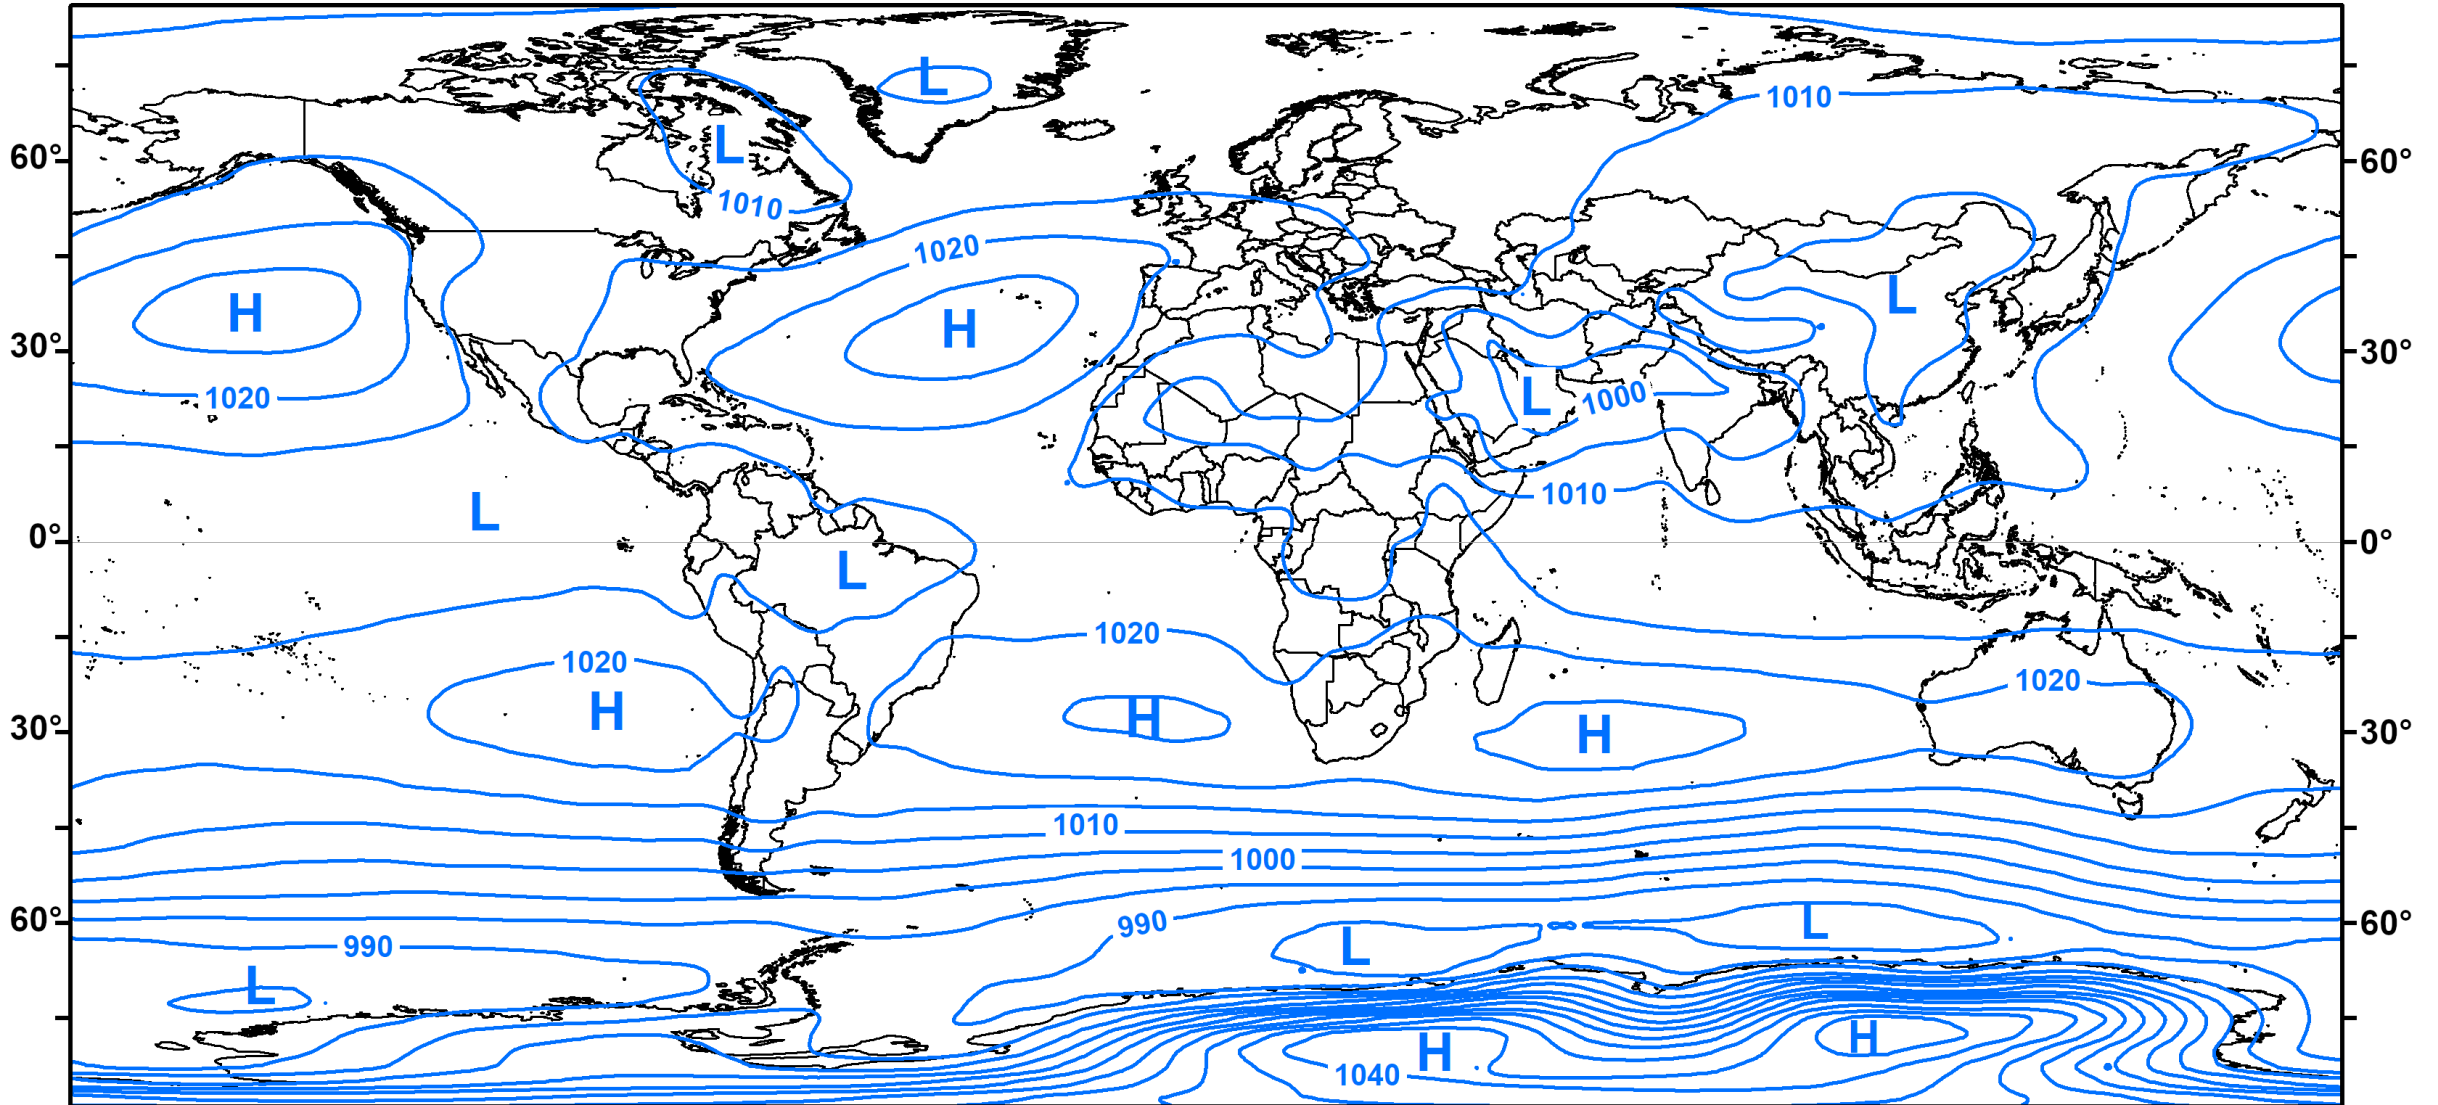

Atmospheric reanalysis – usage

Mean January sea level pressure

Atmospheric reanalysis – usage

Mean July sea level pressure

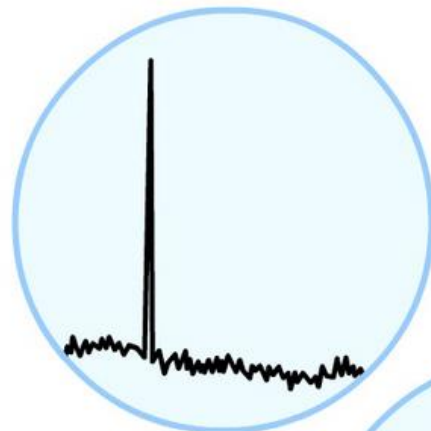

Climatological data sources

- National weather services
- Global / continental databases:
 - **CRU** – global station-based gridded data: <https://crudata.uea.ac.uk/cru/data/hrg/>
 - **Climate reanalyzer** – various types of data: <https://climatereanalyzer.org/>
 - **ECA&D** database – European in-situ measurements <https://www.ecad.eu/>
 - **E-OBS** – gridded data from ECA&D <https://cds.climate.copernicus.eu/cdsapp#!/dataset/insitu-gridded-observations-europe?tab=overview>
- Data from atmospheric reanalyses:
 - Copernicus climate services (C3S): <https://cds.climate.copernicus.eu>
 - ECMWF database: <https://apps.ecmwf.int/datasets/>
 - NCEP/NCAR data: <https://psl.noaa.gov/data/gridded/data.ncep.reanalysis.html>
- Data download via R programming:
 - <https://www.rdocumentation.org/packages/RNCEP/versions/1.0.10/topics/NCEP.gather>
 - <https://dominicroye.github.io/en/2018/access-to-climate-reanalysis-data-from-r/>

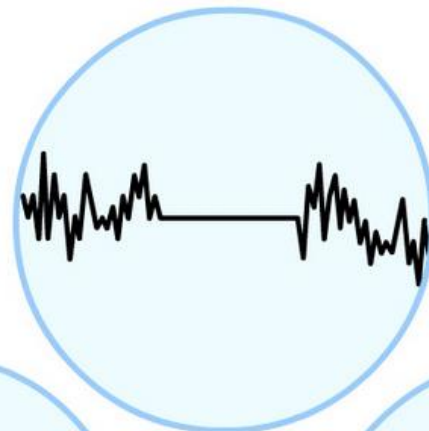

Climate data processing

Look at your data!

- Quality control

Spike

Flatliner

Outlier

Excessive Range

Change Points

Climate data processing

- **Homogenization**

- Done to the temporal variations in the adjusted data reflect only the variations due to climate processes

Possible **sources of inhomogeneities** in station data:

- Sheltering and exposure
- **Daily mean** calculations, observation hours and daylight-saving times
- **Units** of observed elements
- **Urbanization** and land-use changes
- Automatization of stations / new types of instruments
- **Quality control** and data recovery procedures, etc.

Climate data processing – homogenization

Significant change points and downward shifts in the mean in the precipitation amounts for spring (1871–2014)

Climate data processing – homogenization

Methods

- Comparison of the tested station with surrounding stations
- Use of differences between the reference-tested series
- Use of relative homogeneity tests

Types of inhomogeneities

- In **mean**, **variability** or **trend**

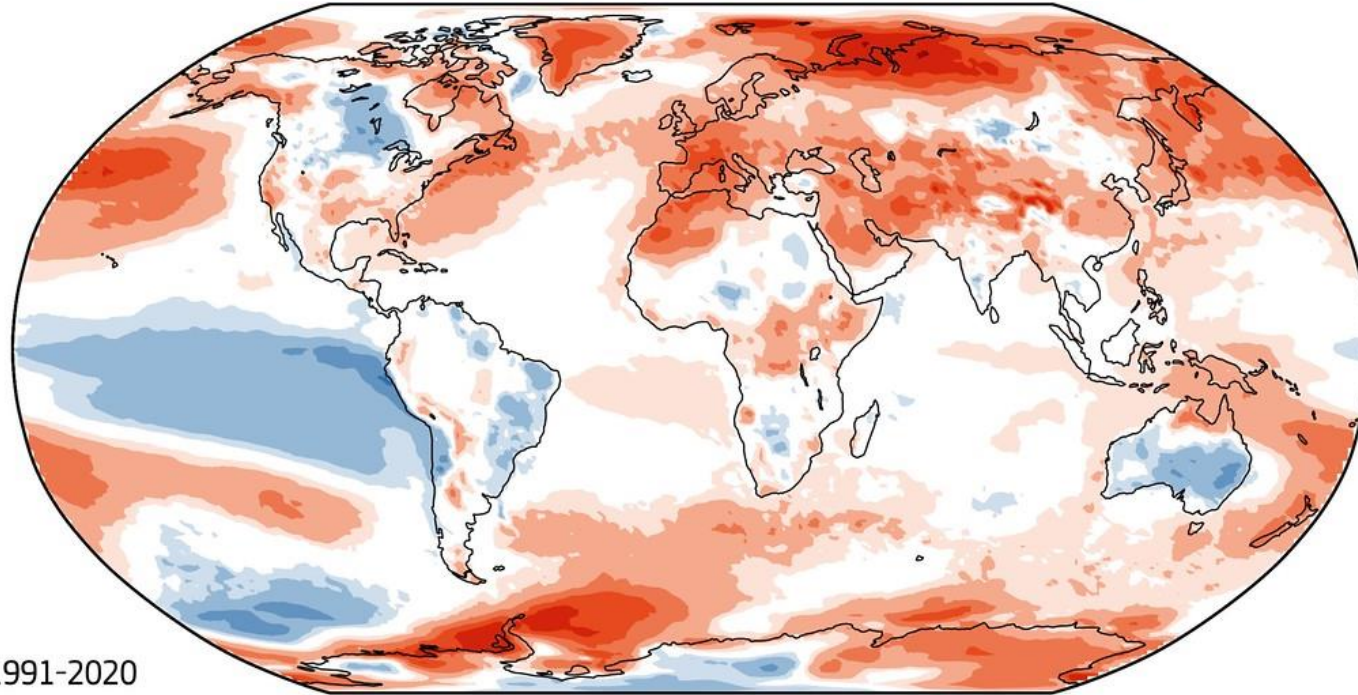

Climate normals

- **Normal (reference) period** – meteorological parameters are analysed for **30-year** (or different) periods
- Arguably the shortest period for **climate variables** calculation
- **Climate normals** – the mean values of climate variables for these periods
- Different locations can be **compared** with one another
- Recent normals: **1991–2020, 1961–1990, 1931–1960, ...**
- Irregular normals: 1981–2010, ...
- Other notable **reference periods**:
 - „preindustrial period“ **1850–1900**

Climate normals

Temperature anomalies,
normal period: 1991–2020

2022 Surface air temperature anomaly

Data source: ERA5
Reference period: 1991-2020
Credit: C3S/ECMWF

Climate charts (diagrams)

- brief summaries of average climatic variables and their time course

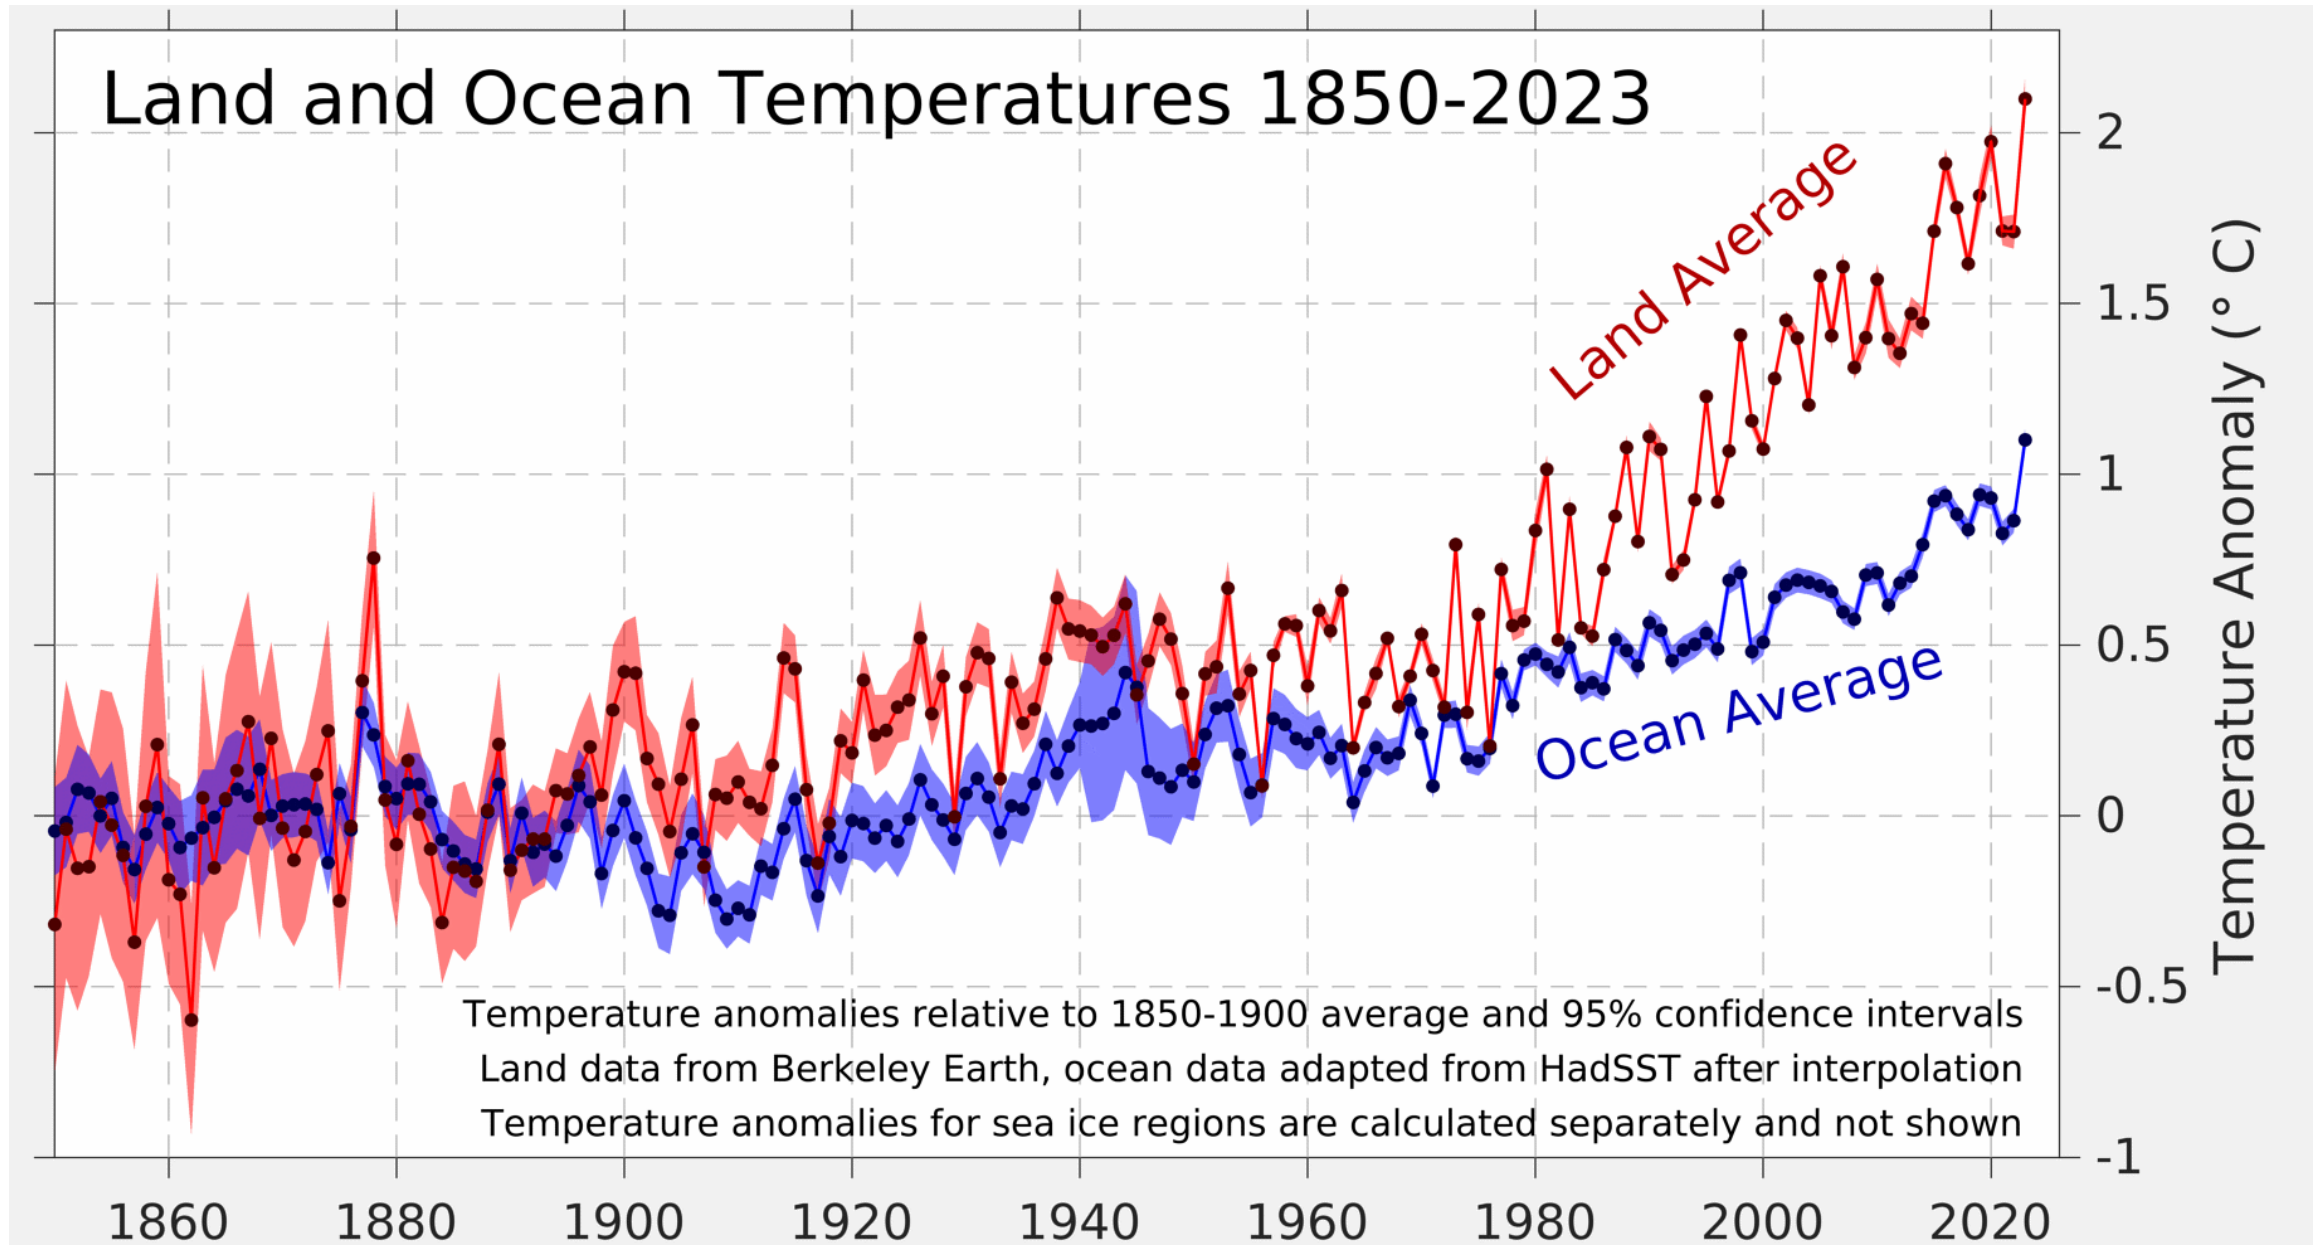

- 1 Country name, station location and elevation, station name
- 2 Period of observation of temperature (77 years) and precipitation (55 years)
- 3 Annual average of temperature and annual precipitation sum
- 4 (red) Temperature curve
- 5 (blue) Precipitation time series
- 6 Indication of frost periods
- 7 Mean daily max. temperature of the warmest month
- 8 Mean daily min. temperature of the coldest month

Climate data visualization – climate change

Climate data visualization – climate change

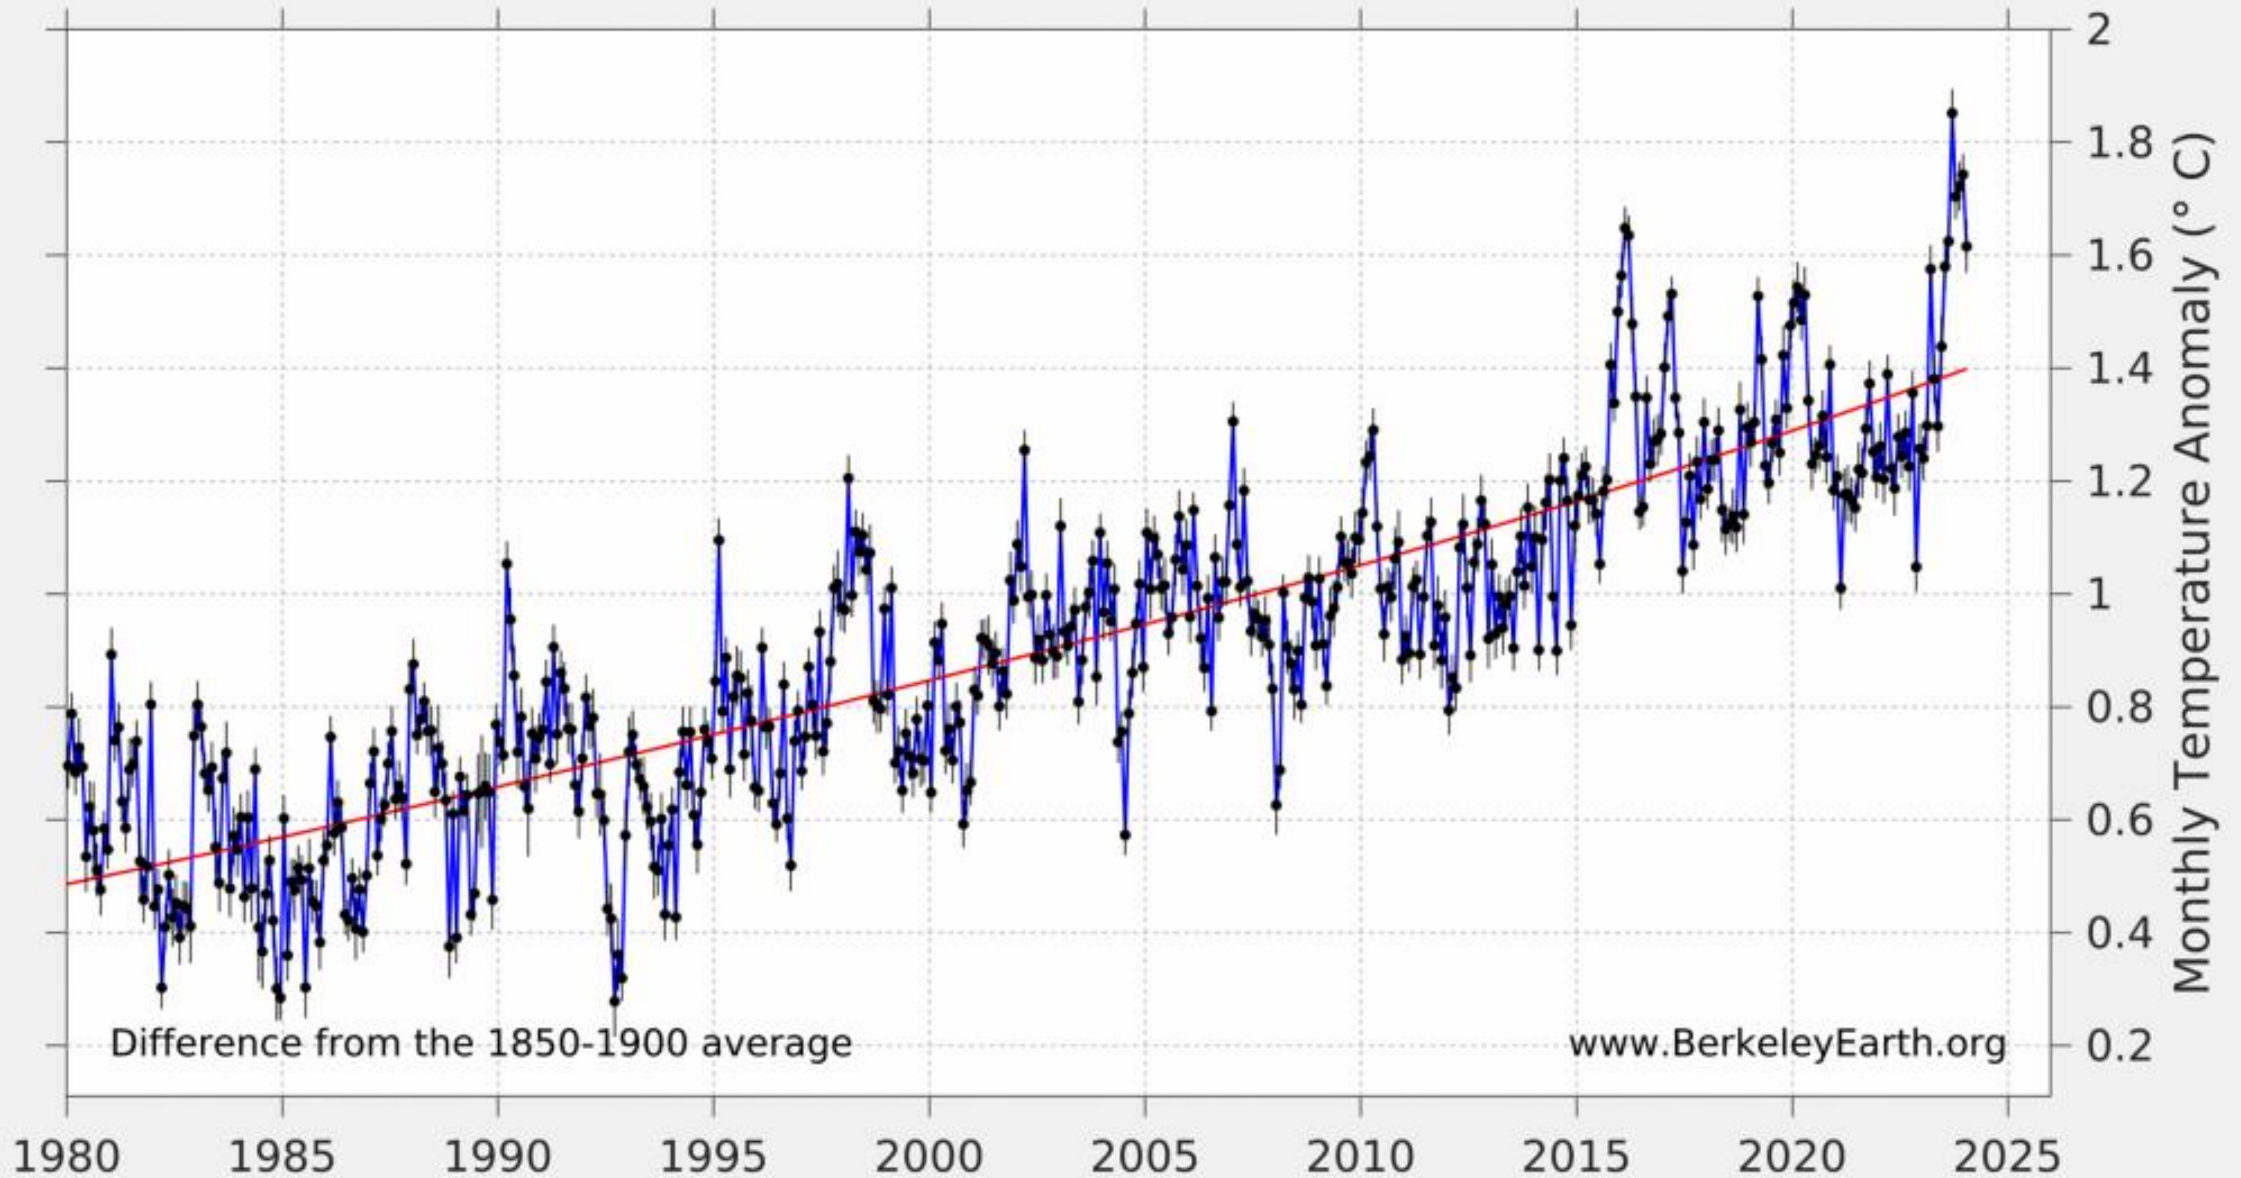

Climate data visualization – climate change

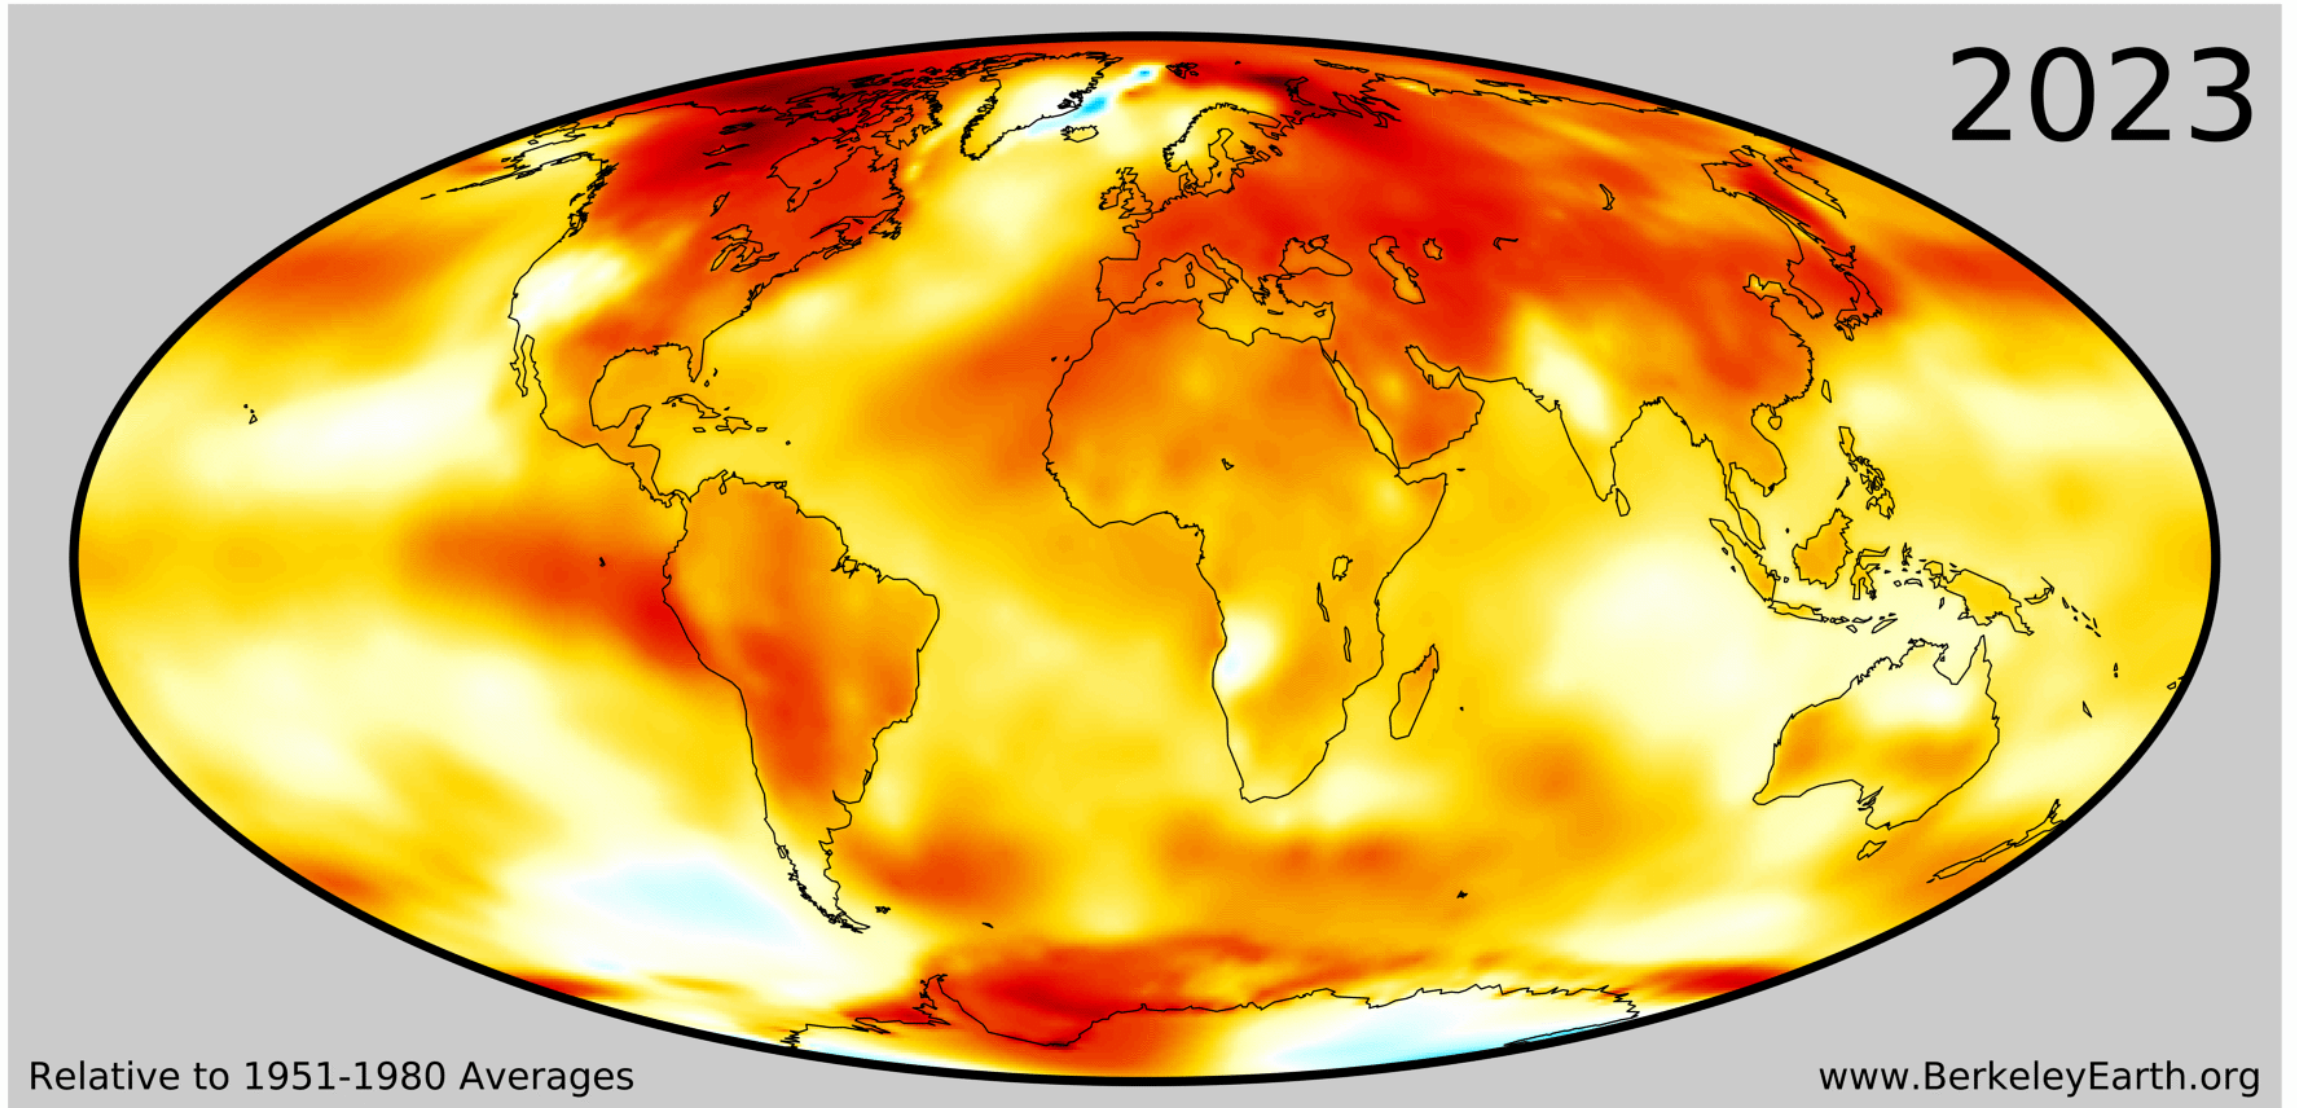

Climate data visualization – climate change

Berkeley Earth - Global

Climate data visualization – climate change

Climate data visualization – climate change

Temperature and precipitation series for the Czech Republic

Climate Spiral (created by NASA)

- monthly global temperature anomalies (changes from an average) between the years 1880 and 2022

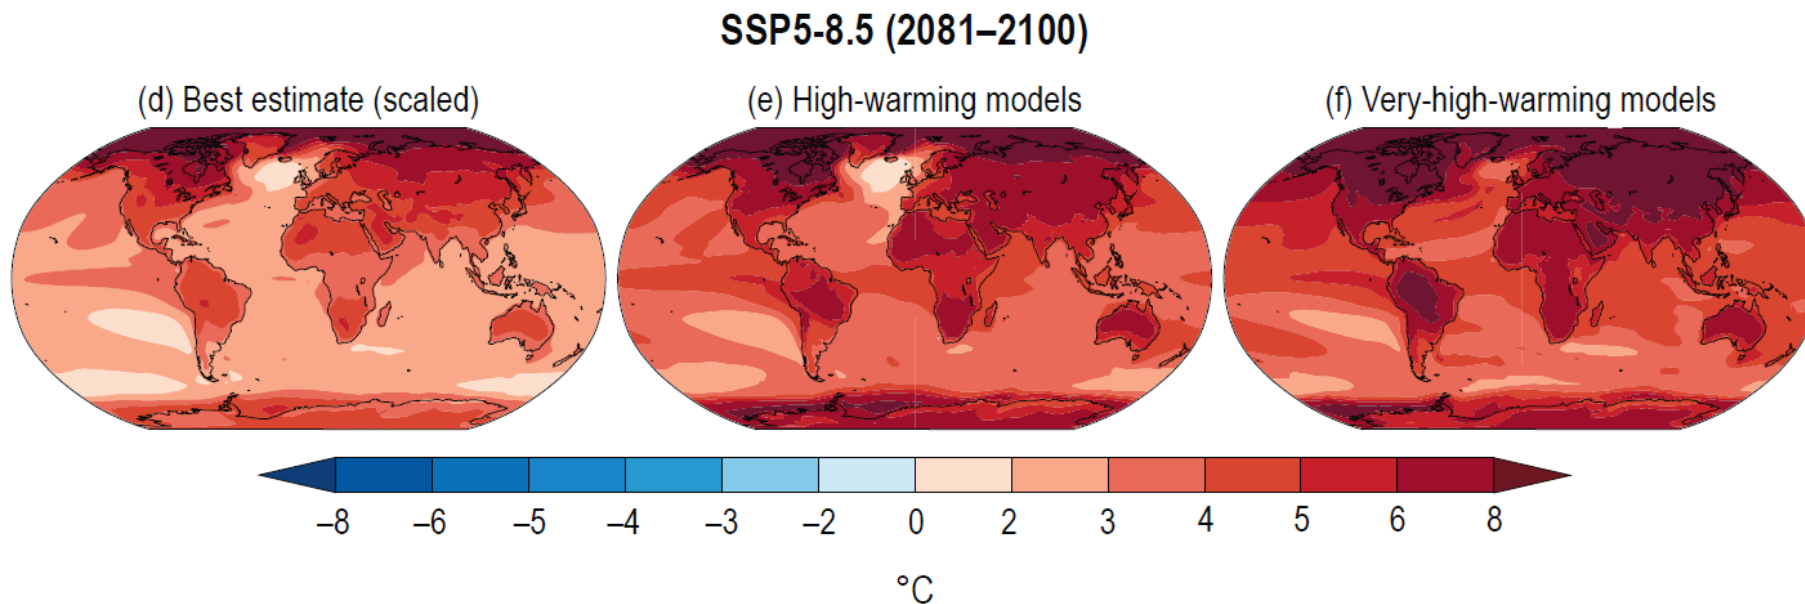

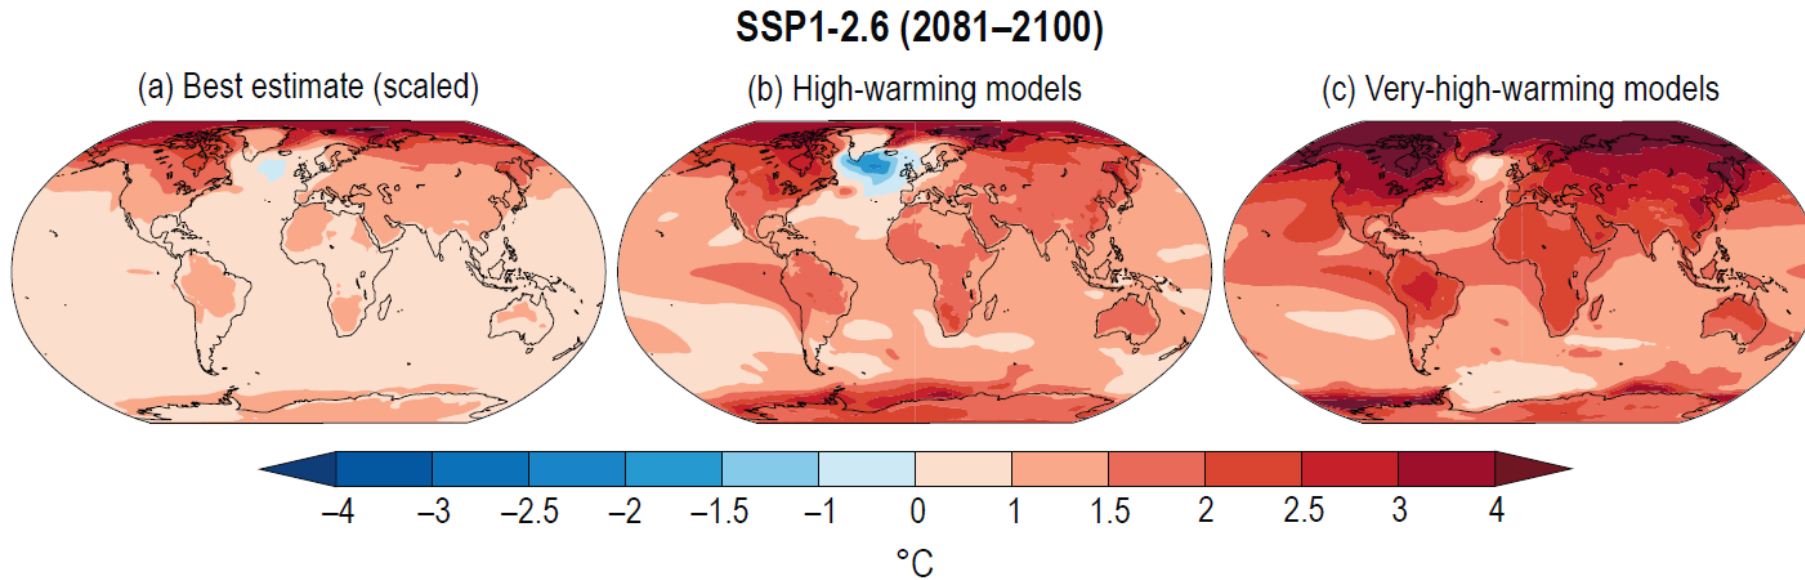

Monthly global mean temperatures 1851 2020 (compared to 1850-1900 averages)

Data: HadCRUT5 - Created by: @neilrkaye

Climate data visualization – climate models

Climate data visualization – climate models

(e) Warming to 2100 depends on the scenario

Climate data visualization – climate models

Climate data visualization – climate models

Seasonal mean precipitation change
