

## 05 Climate models

Ladislava Řezníčková, MSc, PhD

# Content

1. Climate models
2. Emission scenarios
3. Climate change scenarios

# What is a climate model?

- **quantitative mathematical description** of aspects of the Earth's **climate system** based on **physical, chemical and biological** properties of its components, its **interactions** and **feedback** processes

# Purpose of a climate model

- increase our understanding of **how the climate system works**
- **simulate past climate fluctuations** to help interpret historical and paleo observations
- **simulate the future climate** based on scenarios for emissions of GHGs

**Climate projections** - to better inform decisions of national, regional, and local importance (water resource management, agriculture, transportation, and urban planning)

# Climate models

## Primitive equations for climate models

$$\frac{\partial U}{\partial t} = -U \frac{\partial U}{\partial x} - V \frac{\partial U}{\partial y} - \omega \frac{\partial U}{\partial P} + fV - \frac{\partial \Phi}{\partial x} + F_x$$

$$\frac{\partial V}{\partial t} = -U \frac{\partial V}{\partial x} - V \frac{\partial V}{\partial y} - \omega \frac{\partial V}{\partial P} - fU - \frac{\partial \Phi}{\partial y} + F_y$$

$$\frac{\partial \Phi}{\partial P} = -\frac{RT}{P} \quad \leftarrow \text{Hydrostatic Balance}$$

$$\frac{\partial U}{\partial x} + \frac{\partial V}{\partial y} + \frac{\partial \omega}{\partial P} = 0$$

$$\frac{\partial T}{\partial t} = -U \frac{\partial T}{\partial x} - V \frac{\partial T}{\partial y} + \omega \left( \frac{RT}{c_p P} - \frac{\partial T}{\partial P} \right) + \frac{H}{c_p}$$

$$\frac{\partial q}{\partial t} = -U \frac{\partial q}{\partial x} - V \frac{\partial q}{\partial y} - \omega \frac{\partial q}{\partial P} + e - p$$

**U, V, and omega** are the three components of the wind (in pressure coordinates).

**T** is temperature, **P** is pressure, **q** is specific humidity, **F** is friction (surface drag and momentum transport of unresolved eddies)

**R** is the dry air gas constant, **c<sub>p</sub>** is the heat capacity at constant pressure, **e** is the net evaporation, and **p** is the net precipitation

**H** is the net diabatic heating term, and **H=H<sub>L</sub> + H<sub>c</sub> + H<sub>r</sub> + H<sub>s</sub>**

where **H<sub>L</sub>**=latent heating from condensation/evaporation

**H<sub>c</sub>**=heating caused by convection/vertical motion

**H<sub>r</sub>**=radiative heating

**H<sub>s</sub>**=sensible heating from the Earth's surface

# Climate models

## The climate system components

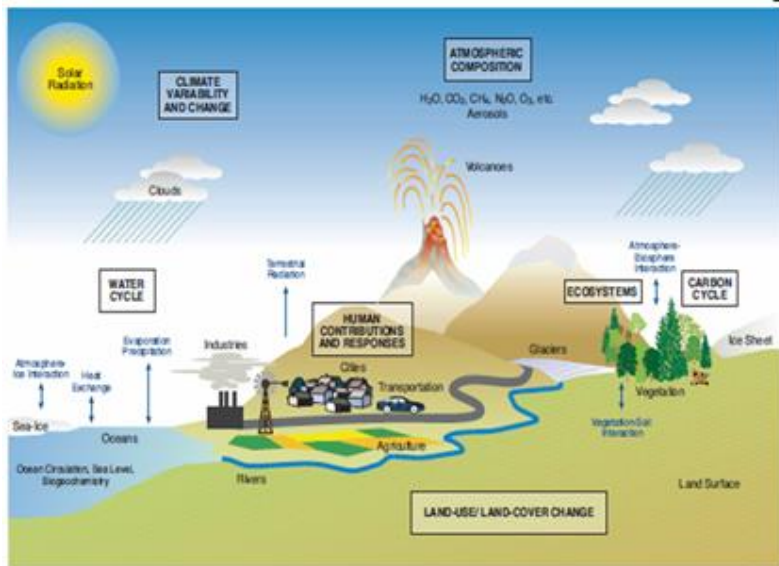

# Climate models

## Schematic for Global Atmospheric Model

Horizontal Grid (Latitude-Longitude)

Vertical Grid (Height or Pressure)

# Weather vs climate models

**Weather versus Climate**

The difference between weather and climate is a matter of time

**Weather**  
refers to short-term changes in the atmosphere. It can change minute-to-minute, hour-to-hour and day-to-day

**Climate**  
describes the average weather conditions in a specific area over a long period of time – 30 years or more

Satellites measure several aspects of Earth's weather as well as provide essential data over decades to monitor how our climate is changing

For more information, visit space for our climate:

| Day | Weather Icon |
|-----|--------------|
| Mon | Sun          |
| Tue | Sun & Cloud  |
| Wed | Cloud        |
| Thu | Cloud & Rain |
| Fri | Cloud & Snow |

| Year | Temperature Trend |
|------|-------------------|
| 1995 | Low               |
| 2000 | Medium-Low        |
| 2005 | Low               |
| 2010 | Medium            |
| 2015 | Low               |
| 2020 | Medium-High       |
| 2025 | Low               |
| 2030 | Medium-High       |
| 2035 | Low               |
| 2040 | Medium-High       |

# Development of climate models

# Complexity of climate models

# Spatial and Temporal Resolution

PROGRESSION OF CLIMATE MODELS  
1990s

**AR5:** “70km maximum horizontal resolution; up to 90 layers in the atmosphere and over 60 in the ocean.”

# Types of climate models

## 1. Global Climate/Circulation Model (GCM), Earth System Model (ESM)

- simulate the climate of the whole world

## 2. Regional Climate Model (RCM)

- simulate the climate only for a part of the world

Models with more or less complexity/coupling:

**1. Atmospheric** models

**2. Coupled** models (ocean and atmosphere)

**3. Earth System** models (couple even more systems)

**4. Specific** climate models

# EBM – Energy Balance Model

- analysis of the energy budget of the Earth
- basic processes and feedbacks
- a large degree of parameterization
- zero-dimensional EBMs

**Parameterization** - some processes are not explicitly included in models because of simplifications, lack of knowledge of the mechanisms, or because the spatial resolution of the model is not high enough to include them. They are represented by parameterisations in models.

# EMIC - Earth Model of Intermediate Complexity

- including the geography of the Earth
- grid size 300–1000 km

# GCM – General Circulation Model

grid size 100-200 km

more detailed information on a regional scale

Climate Models circa early 1990s

Global coupled climate models in 2006

Regional models

Global models in 5-10 yrs

Optimistic view on model-development

| 10 | CSIR-CSIRO  | South Africa | 21 | MOHC          | UK      | 32 | IHU           | China             |
| 11 | CSIRO-BOM   | Australia    | 22 | MPI-M         | Germany | 33 | Seoul Nat.Uni | Republic of Korea |

CSIRO also contributed to CMIP5 using two previous versions of ACCESS (v1.0 and v1.3). In a comparison of ACCESS models against other CMIP5-contributed models, ACCESS performed very well:

# Global (GCMs) vs Regional climate models (RCMs)

## RCMs

- use global model outputs as boundary conditions to calculate conditions in limited (smaller) areas with higher spatial resolution
- significantly lower reliability.

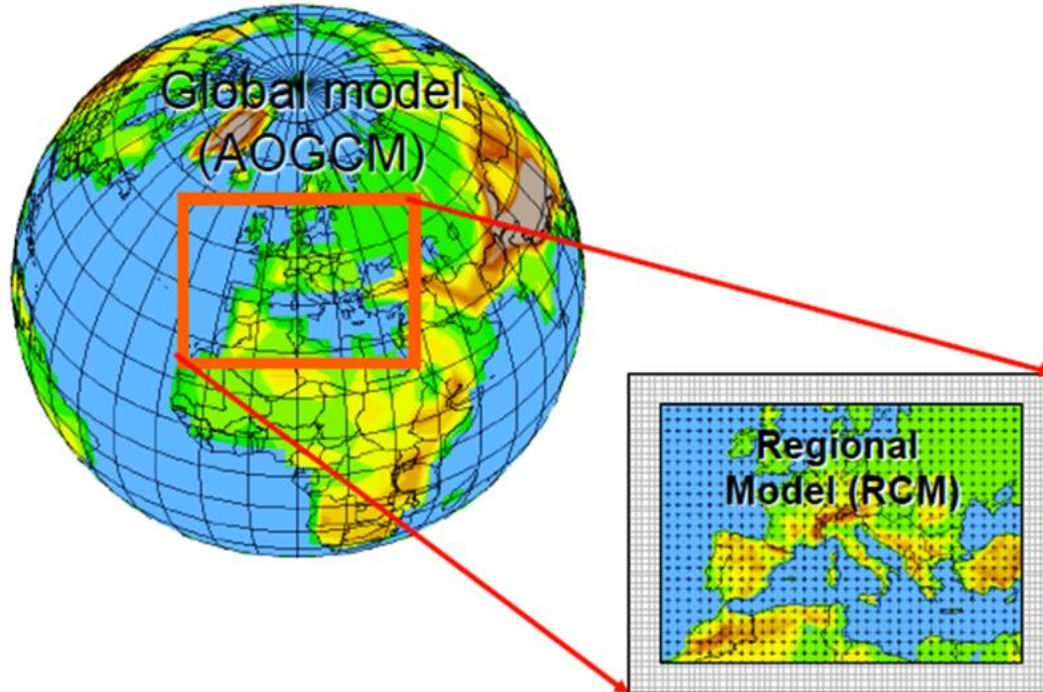

Fig. 1: Regional climate downscaling provides greater detail at local and regional scales, which is vital to improving analyses of vulnerability, impact and adaptation

(Illustration courtesy of Justin Glisan)

# What are emission scenarios, climate models and climate scenarios/projections?

- **Climate models** are used together with emission scenarios to calculate the probable future climate, so-called **climate scenarios/projections**.
- The **climate models** describe how the earth's climate functions, while the **emission scenarios** describe the impact of humans on the environment.
- If the climate models are combined with the emission scenarios, it is possible to predict with a **certain amount of probability** how the climate will be in the future.

# Climate scenarios

- possible future of the Earth's climate
- based on its current observed state and different **GHG emission scenarios**
- potential impacts of **anthropogenic climate change**
- climate projections
- **not a forecast** of the future climate
- **alternative possibilities** of how the future can develop

# MODEL DESCRIPTION OF THE CLIMATE SYSTEM

components

processes

chemistry

feedbacks

# MODEL DESCRIPTION OF WORLD DEVELOPMENT

economic activity

new technologies

population

# CLIMATE SCENARIO

lower estimate

best estimate

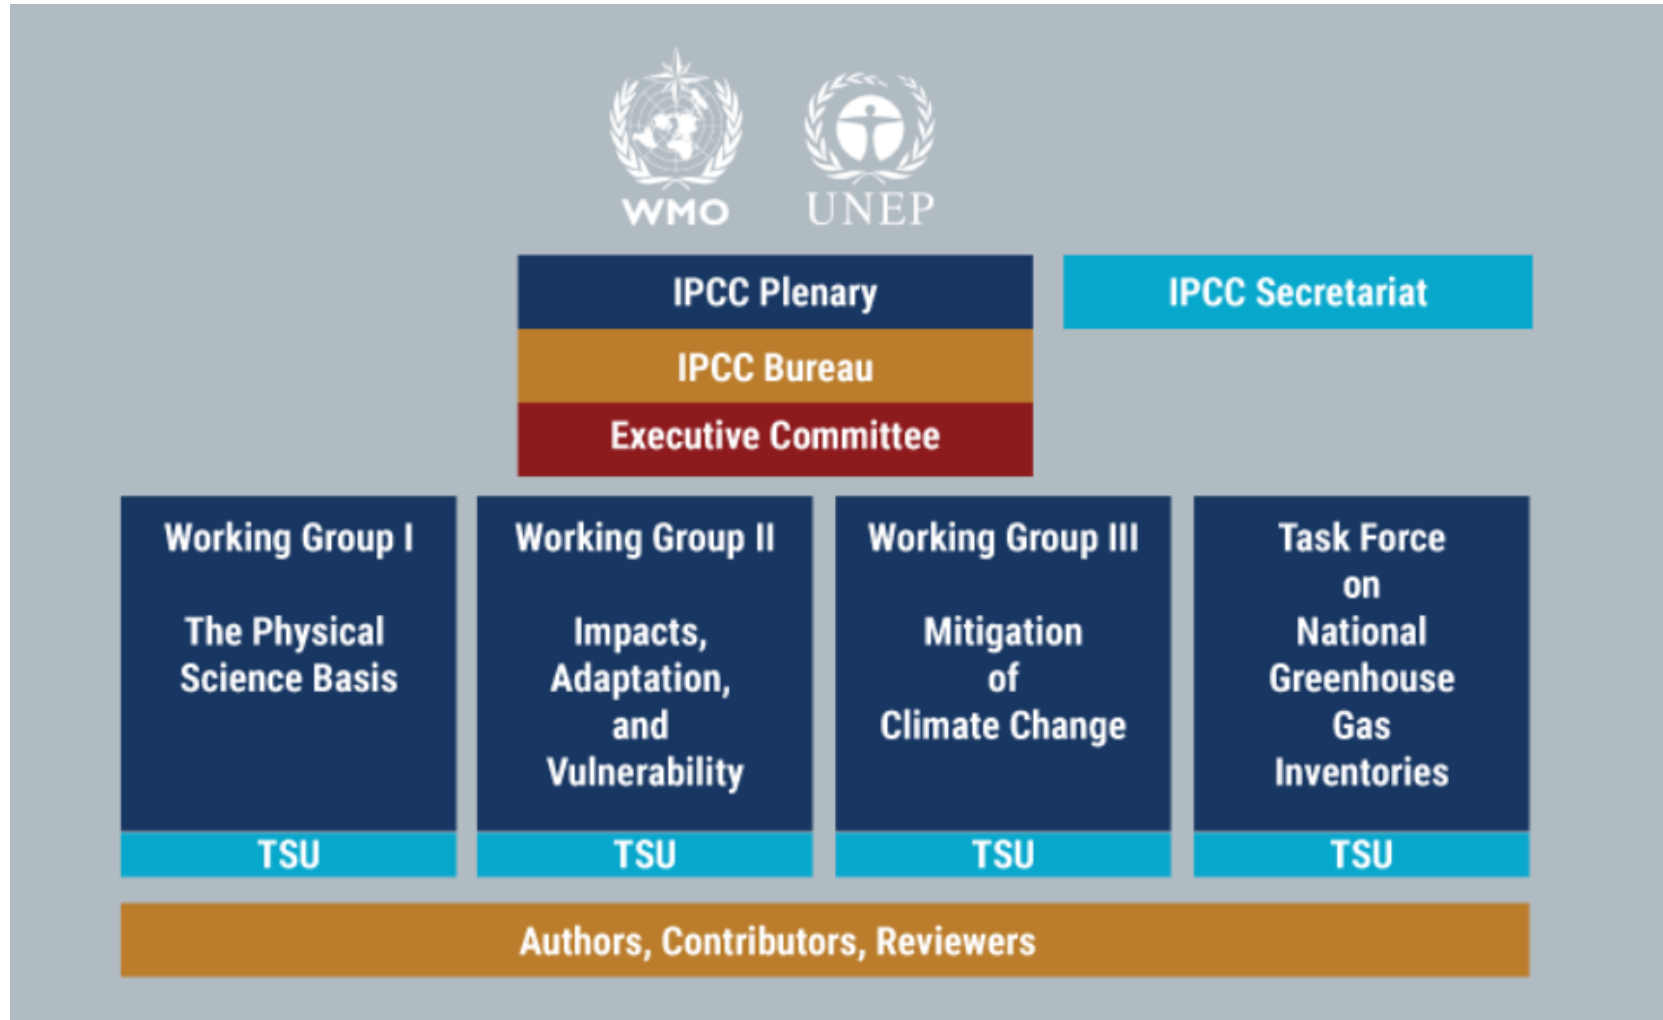

upper estimate

# The Intergovernmental Panel on Climate Change (IPCC)

- the **United Nations** body for assessing the science related to climate change,
- provides **regular assessments** of the scientific basis of climate change, its impacts and future risks, and options for adaptation and mitigation,
- currently has **195 members**.

# The Intergovernmental Panel on Climate Change (IPCC)

# The Intergovernmental Panel on Climate Change (IPCC)

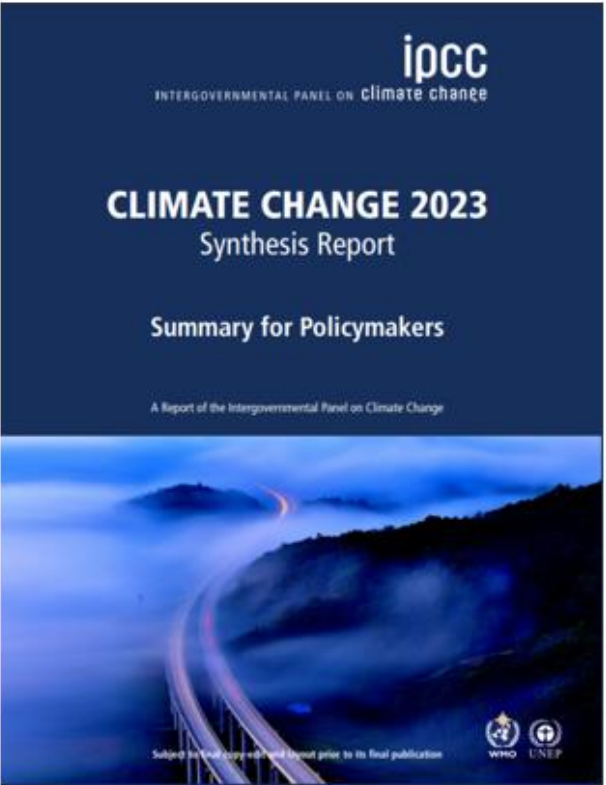

## Assessment Reports

- First Assessment Report (**FAR**, 1990), Supplementary Report (1992)
- Second Assessment Report (**SAR**, 1996)
- Third Assessment Report (**TAR**, 2001)
- Fourth Assessment Report (**AR4**, 2007)
- Fifth Assessment Report (**AR5**, 2013-2014)
- Sixth Assessment Report (**AR6**, 2021-2023)

# The Intergovernmental Panel on Climate Change (IPCC)

## 2021–2023: Sixth Assessment Report (AR6)

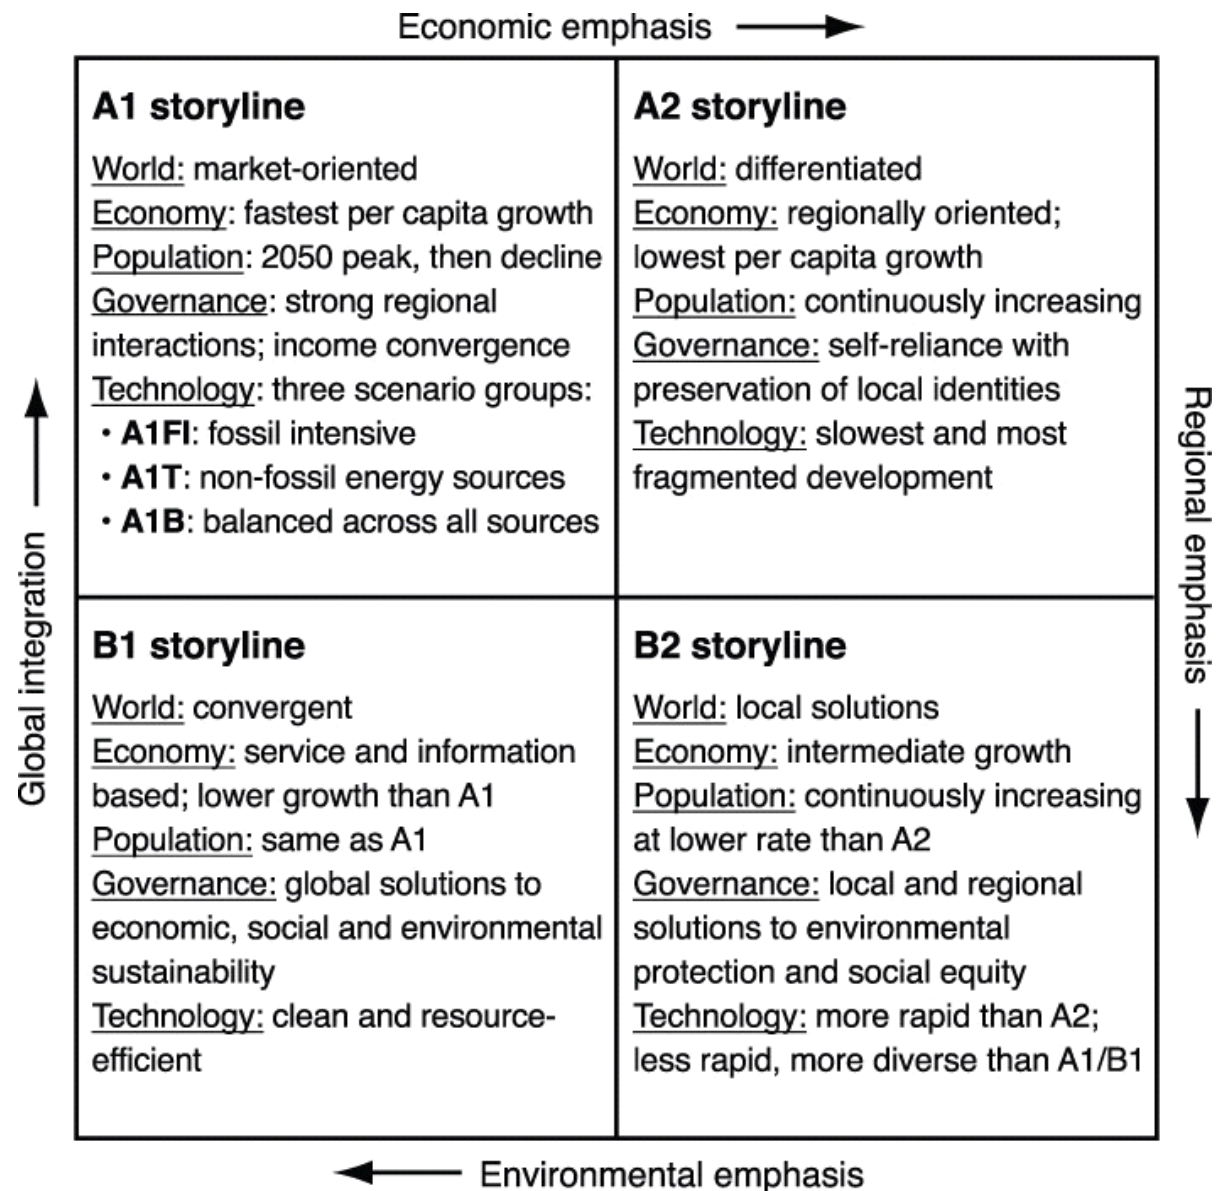

# Emissions Scenarios

- possible future development of **GHG concentrations** based on the fulfilment of certain assumptions
- First scenarios: IPCC FAR 1990, new for each AR
- They include the main demographic, ecological and technological influences on **future emissions of GHGs**, sulfur compounds, aerosols, etc.

# Special Report on Emissions Scenarios (SRES), 2000

- used in:  
IPCC TAR (2001)  
IPCC AR4 (2007)
- do not take into account any current or future measures to limit GHG emissions

## MULTI-MODEL AVERAGES AND ASSESSED RANGES FOR SURFACE WARMING

# Projected global average surface warming and sea level rise at the end of the 21st century

**Table 3.1.** Projected global average surface warming and sea level rise at the end of the 21<sup>st</sup> century. {WGI 10.5, 10.6, Table 10.7, Table SPM.3}

| Case   | Temperature change<br>(°C at 2090-2099 relative to 1980-1999) <sup>a, d</sup> |              | Sea level rise<br>(m at 2090-2099 relative to 1980-1999)                  |
|--|---|--------------|---|
|  | Best estimate   | Likely range | Model-based range<br>excluding future rapid dynamical changes in ice flow |
| Constant year 2000 concentrations <sup>b</sup> | 0.6   | 0.3 – 0.9    | Not available   |
| B1 scenario                                    | 1.8   | 1.1 – 2.9    | 0.18 – 0.38   |
| A1T scenario                                   | 2.4   | 1.4 – 3.8    | 0.20 – 0.45   |
| B2 scenario                                    | 2.4   | 1.4 – 3.8    | 0.20 – 0.43   |
| A1B scenario                                   | 2.8   | 1.7 – 4.4    | 0.21 – 0.48   |
| A2 scenario                                    | 3.4   | 2.0 – 5.4    | 0.23 – 0.51   |
| A1FI scenario                                  | 4.0   | 2.4 – 6.4    | 0.26 – 0.59   |

# RCP - Representative Concentration Pathways (2011)

- different climate change scenarios, all of which are considered possible depending on the amount of GHGs emitted in the years to come

**Table SPM.2** | Projected change in global mean surface air temperature and global mean sea level rise for the mid- and late 21st century relative to the reference period of 1986–2005. {12.4; Table 12.2, Table 13.5}

|  |          | 2046–2065 |                                  | 2081–2100 |                                  |
|--|----------|-----------|----------------------------------|-----------|----------------------------------|
|  | Scenario | Mean      | <i>Likely range</i> <sup>c</sup> | Mean      | <i>Likely range</i> <sup>c</sup> |
| <b>Global Mean Surface Temperature Change (°C)<sup>a</sup></b> | RCP2.6   | 1.0       | 0.4 to 1.6                       | 1.0       | 0.3 to 1.7                       |
|  | RCP4.5   | 1.4       | 0.9 to 2.0                       | 1.8       | 1.1 to 2.6                       |
|  | RCP6.0   | 1.3       | 0.8 to 1.8                       | 2.2       | 1.4 to 3.1                       |
|  | RCP8.5   | 2.0       | 1.4 to 2.6                       | 3.7       | 2.6 to 4.8                       |
|  | Scenario | Mean      | <i>Likely range</i> <sup>d</sup> | Mean      | <i>Likely range</i> <sup>d</sup> |
| <b>Global Mean Sea Level Rise (m)<sup>b</sup></b>              | RCP2.6   | 0.24      | 0.17 to 0.32                     | 0.40      | 0.26 to 0.55                     |
|  | RCP4.5   | 0.26      | 0.19 to 0.33                     | 0.47      | 0.32 to 0.63                     |
|  | RCP6.0   | 0.25      | 0.18 to 0.32                     | 0.48      | 0.33 to 0.63                     |
|  | RCP8.5   | 0.30      | 0.22 to 0.38                     | 0.63      | 0.45 to 0.82                     |

# SSP - Shared Socioeconomic Pathways (2021)

# Predicted atmospheric CO<sub>2</sub> concentrations for different SSPs across the 21st century

# Climate projections until the end of the 21st century (IPCC, AR6)

Assessed projected change in 20-year running mean global surface temperature for five scenarios

(e) Warming to 2100 depends on the scenario

# Climate projections until the end of the 21st century (IPCC, AR6)

## Changes in global surface temperature for selected 20-year time periods

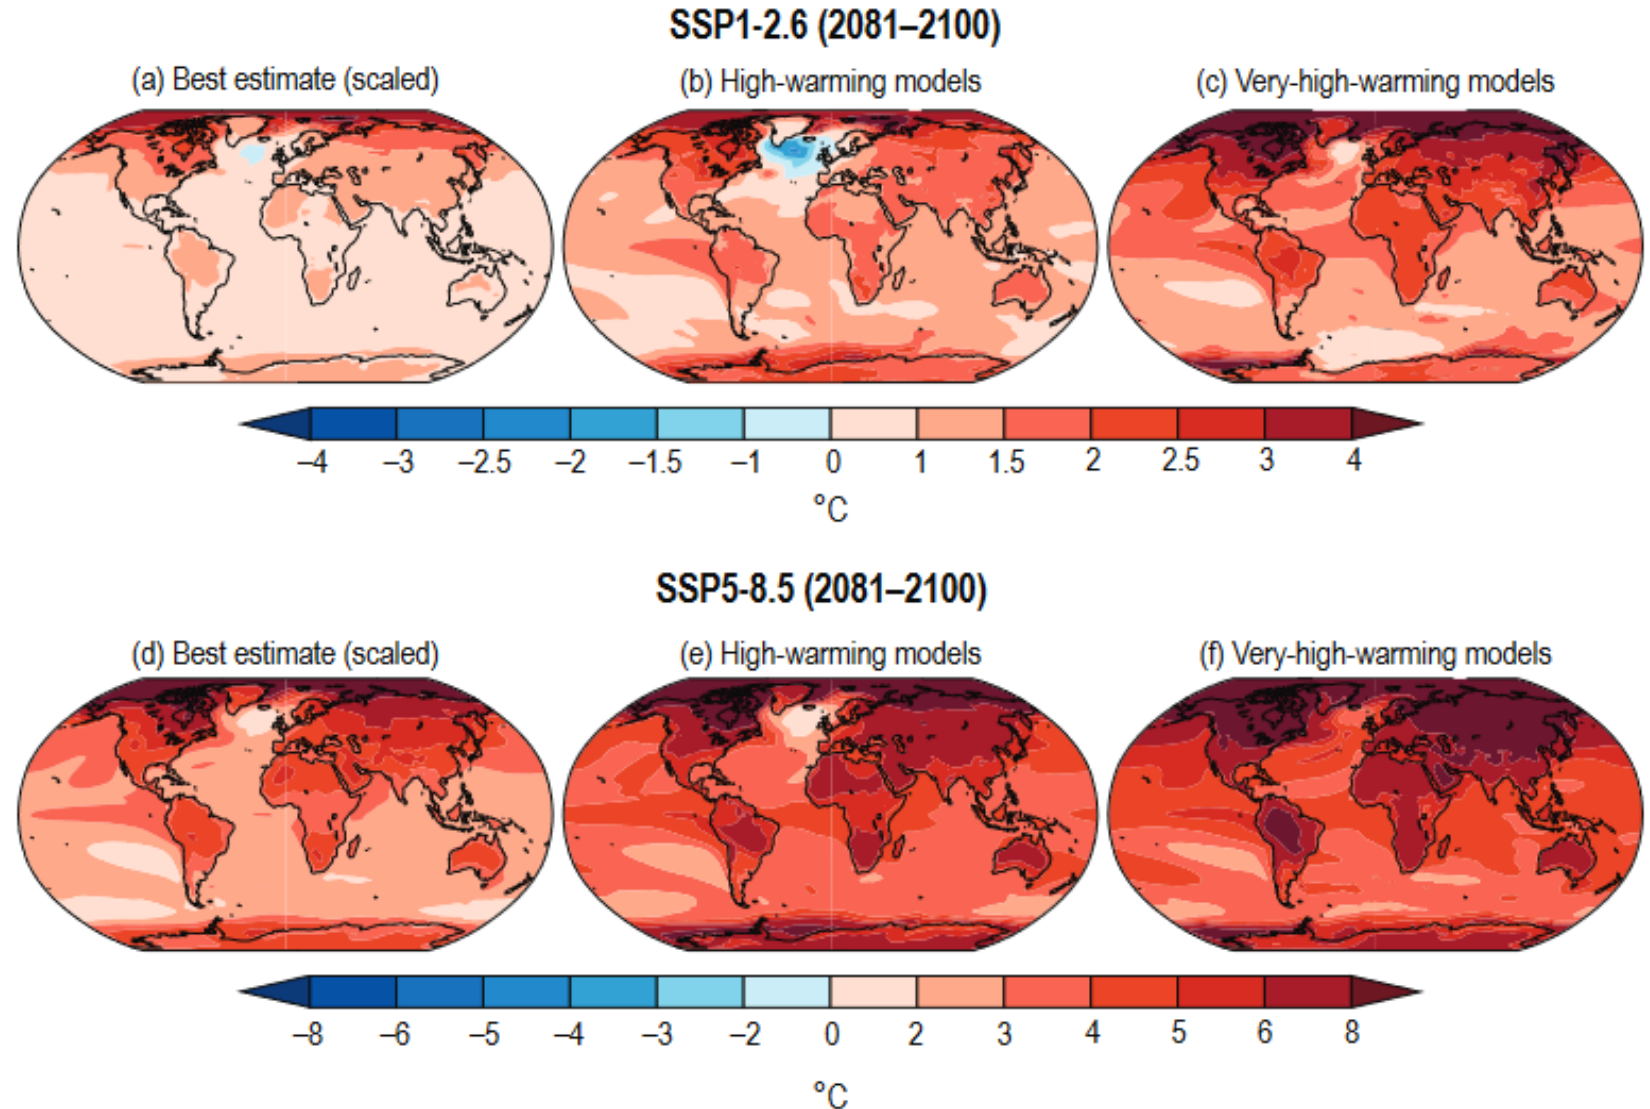

**Table SPM.1 | Changes in global surface temperature, which are assessed based on multiple lines of evidence, for selected 20-year time periods and the five illustrative emissions scenarios considered.** Temperature differences relative to the average global surface temperature of the period 1850–1900 are reported in °C. This includes the revised assessment of observed historical warming for the AR5 reference period 1986–2005, which in AR6 is higher by 0.08 [–0.01 to +0.12] °C than in AR5 (see footnote 10). Changes relative to the recent reference period 1995–2014 may be calculated approximately by subtracting 0.85°C, the best estimate of the observed warming from 1850–1900 to 1995–2014.

{Cross-Chapter Box 2.3, 4.3, 4.4, Cross-Section Box TS.1}

|          | Near term, 2021–2040 |                               | Mid-term, 2041–2060 |                               | Long term, 2081–2100 |                               |
|----------|----------------------|-------------------------------|---------------------|-------------------------------|----------------------|-------------------------------|
| Scenario | Best estimate (°C)   | <i>Very likely</i> range (°C) | Best estimate (°C)  | <i>Very likely</i> range (°C) | Best estimate (°C)   | <i>Very likely</i> range (°C) |
| SSP1-1.9 | 1.5                  | 1.2 to 1.7                    | 1.6                 | 1.2 to 2.0                    | 1.4                  | 1.0 to 1.8                    |
| SSP1-2.6 | 1.5                  | 1.2 to 1.8                    | 1.7                 | 1.3 to 2.2                    | 1.8                  | 1.3 to 2.4                    |
| SSP2-4.5 | 1.5                  | 1.2 to 1.8                    | 2.0                 | 1.6 to 2.5                    | 2.7                  | 2.1 to 3.5                    |
| SSP3-7.0 | 1.5                  | 1.2 to 1.8                    | 2.1                 | 1.7 to 2.6                    | 3.6                  | 2.8 to 4.6                    |
| SSP5-8.5 | 1.6                  | 1.3 to 1.9                    | 2.4                 | 1.9 to 3.0                    | 4.4                  | 3.3 to 5.7                    |

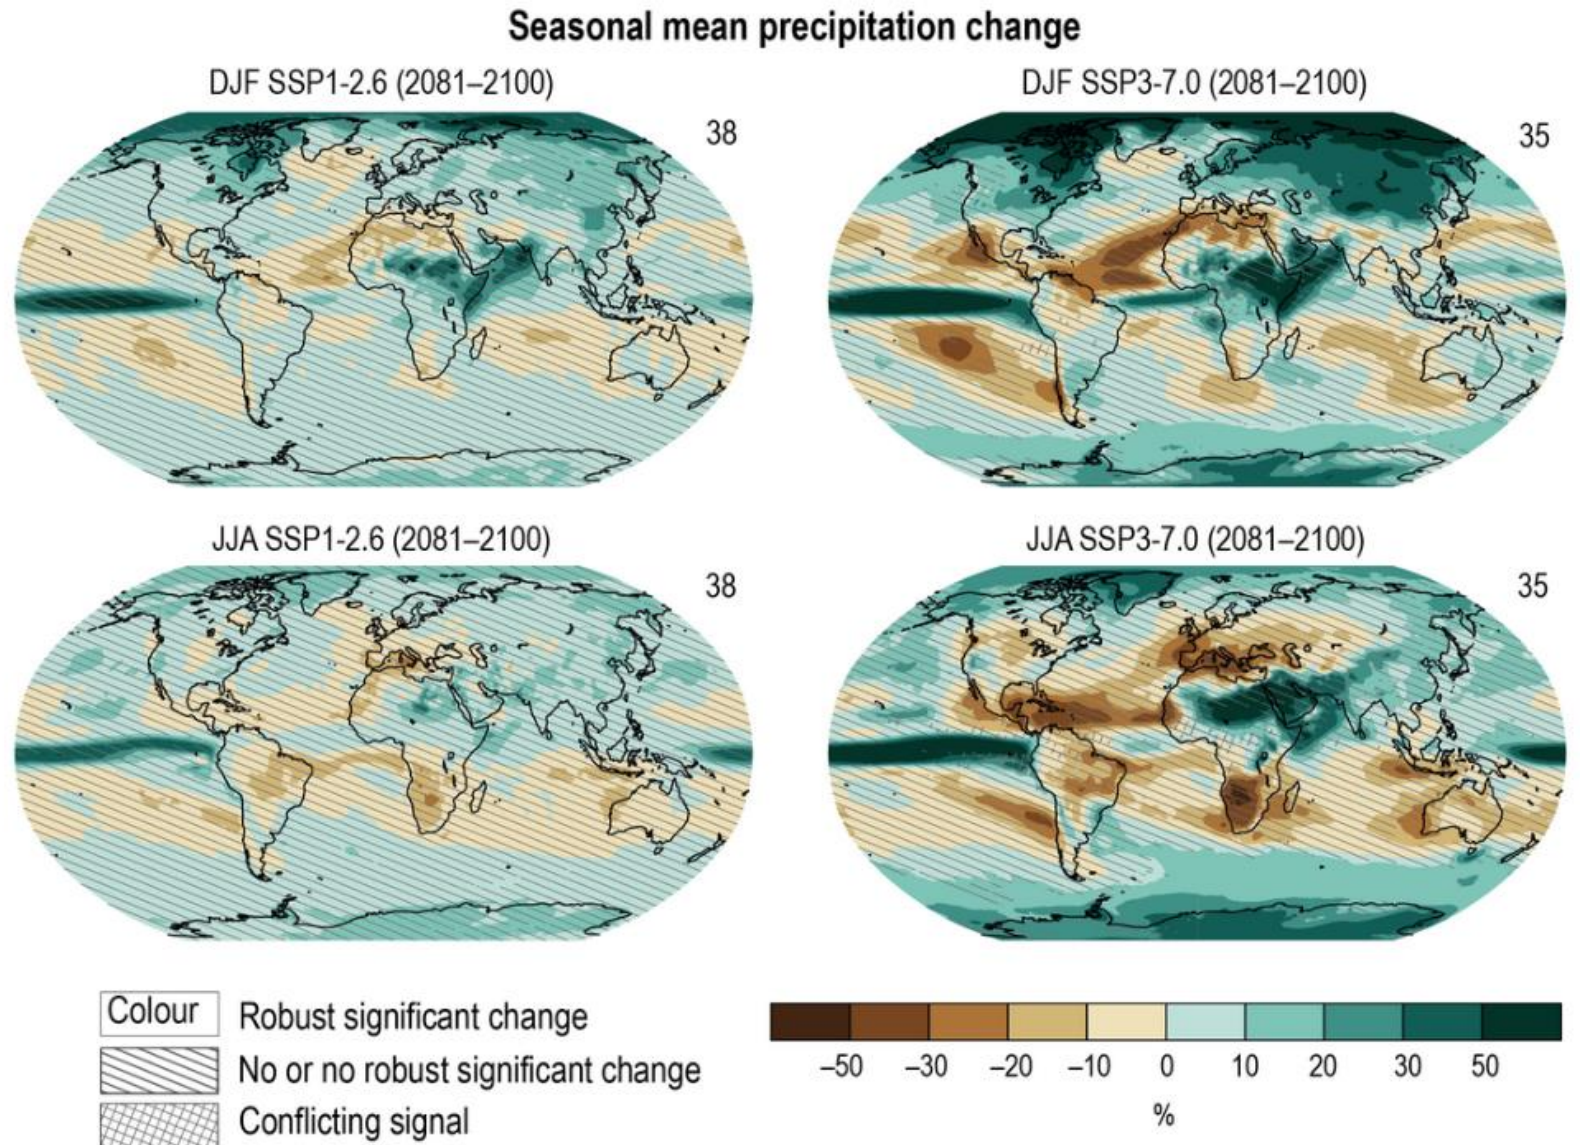

# Climate projections until the end of the 21st century (IPCC, AR6)

**Global surface temperature estimate for SSP1-2.6 and SSP5-8.5 in 2081–2100 relative to 1995–2014**

# Climate projections until the end of the 21st century (IPCC, AR6)

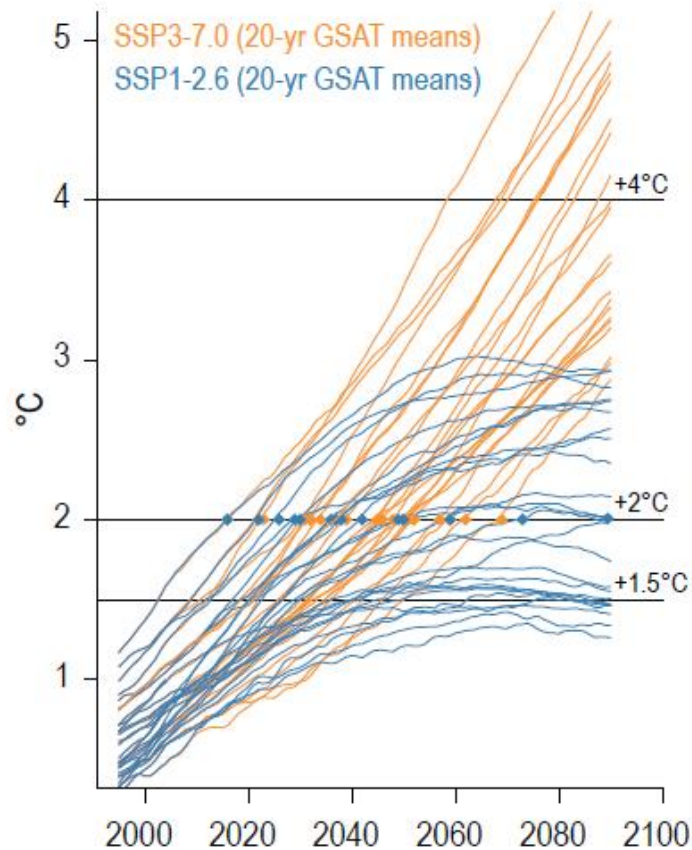

Seasonal mean precipitation change from SSP1-2.6 and SSP3-7.0 in 2081–2100 relative to 1995–2014

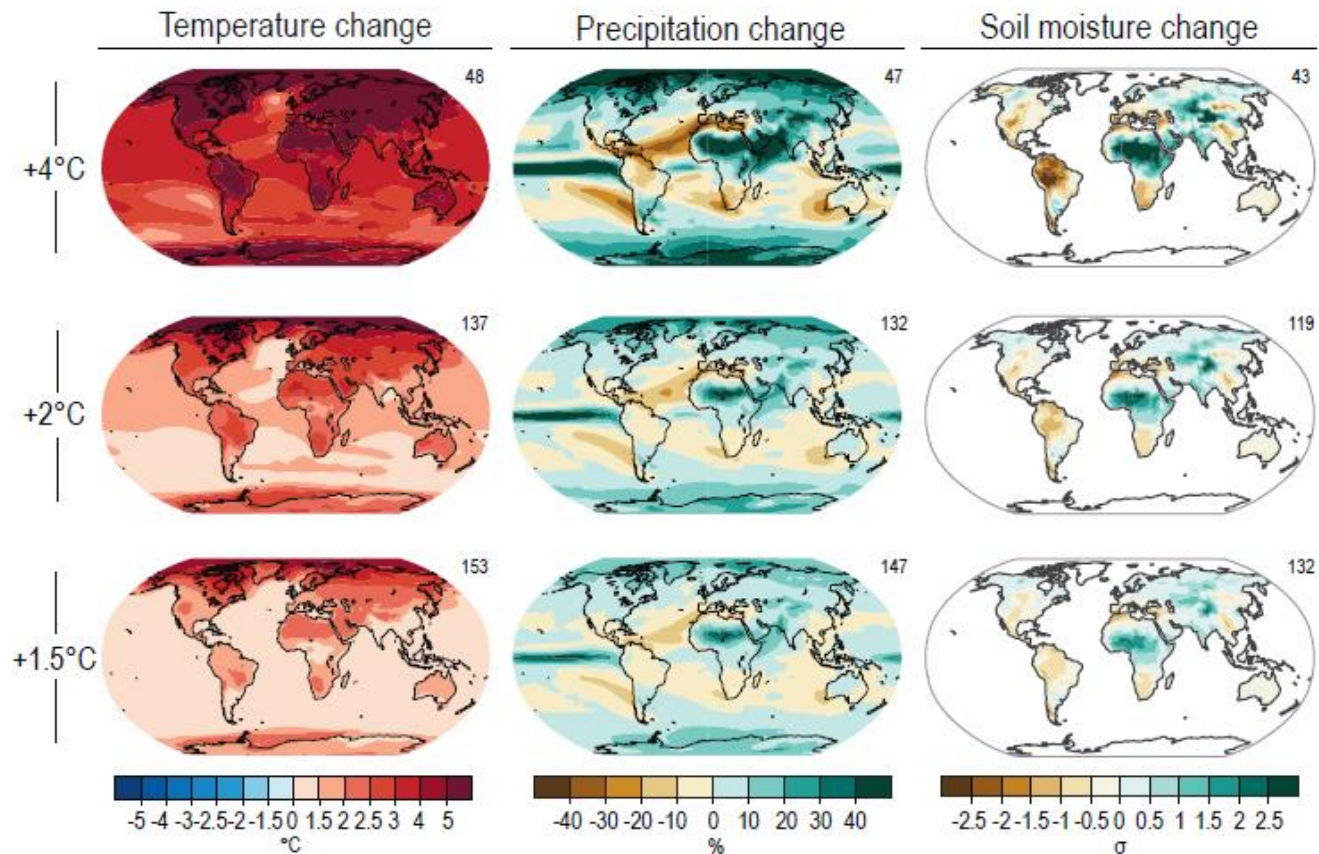

# Climate projections until the end of the 21st century (IPCC, AR6)

## Scenarios, global warming levels, and patterns of change

(a) Global mean temperature in CMIP6

(b) Patterns of change in near-surface air temperature, precipitation and soil moisture

# AR6 Synthesis Report: Climate Change 2023

The Synthesis Report is based on the content of the **three Working Groups Assessment Reports**: WGI – The Physical Science Basis, WGII – Impacts, Adaptation and Vulnerability, WGIII – Mitigation of Climate Change, and the **three Special Reports**: Global Warming of 1.5°C, Climate Change and Land, The Ocean and Cryosphere in a Changing Climate.
