# About this Review

For 60 years, the BP Statistical Review of World Energy has provided high-quality, objective and globally consistent data on world energy markets. The Review is one of the most widely respected and authoritative publications in the field of energy economics, used for reference by the media, academia, world governments and energy companies. A new edition is published every June.

## Methodology

The following methodological changes have been made to this year's Review:

- Fuels used as inputs for conversion technologies (gas-to-liquids, coal-to-liquids, and coal-to-gas) are counted as production for the source fuel and the outputs are counted as consumption for the converted fuel.
- A new table has been added to the Review for consumption of commercial electricity produced from renewable sources. Electricity from renewable sources is converted to tonnes of oil equivalent following the same methodology used for nuclear and hydroelectricity, and is included in the primary energy consumption calculation.
- A new table has been added for biofuels production. Biofuels consumption continues to be included in oil consumption data (see footnotes to oil consumption table).

## Find out more online

*BP Statistical Review of World Energy June 2011* is available online at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview). The website contains all the tables and charts found in the latest printed edition, plus a number of extras, including:

- Historical data from 1965 for many sections.
- Additional data for natural gas, coal, hydroelectricity, nuclear energy, electricity and renewables.
- An energy charting tool, where you can view predetermined reports or chart specific data according to energy type, region and year.
- An oil, natural gas and LNG conversion calculator.
- PDF versions and PowerPoint slide packs of the charts, maps and graphs, plus an Excel workbook of the historical data.

## Appendices

For approximate conversion factors and definitions see page 44.

## About BP

BP is one of the world's largest oil and gas companies, serving millions of customers in more than 90 countries across six continents. Our business segments are Exploration and Production, and Refining and Marketing. Through these business segments, we provide fuel for transportation, retail brands and energy for heat and light.

## Disclaimer

The data series for proved oil and gas reserves in *BP Statistical Review of World Energy June 2011* does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance, under UK accounting rules contained in the Statement of Recommended Practice, 'Accounting for Oil and Gas Exploration, Development, Production and Decommissioning Activities' (UK SORP) or as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country. Rather, the data series has been compiled using a combination of primary official sources and third-party data.

## Guide to navigation

*BP Statistical Review of World Energy June 2011* uses the following icons and colour coding to help you navigate your way quickly and easily through the document. Icons and colours represent various energy types so you can see, at a glance, which section you are in.

## Group chief executive's introduction

**Bob Dudley**  
Group Chief Executive  
June 2011

## Energy in 2010 – a strong rebound

Welcome to the 60th anniversary edition of the BP Statistical Review of World Energy. Sixty years is a long time, and the energy world has seen breathtaking change over this period – in technology, in political and economic systems, and in many other facets of the environment in which companies like ours operate. And yet the need for rigorous information on global energy seems more important today than ever. The data has changed dramatically – but this Review's purpose remains the same as it was in 1951: to provide the most timely, objective global energy data available.

The Statistical Review has evolved in response to changes in the world's energy mix, as well as the increasingly global markets that distribute that energy. What began as a review of global oil data has expanded over the years to include natural gas, coal, nuclear energy and hydroelectricity. Additional online content was added as the internet grew in importance. This year, we are including for the first time in the printed Review tables on renewable energy.

The story told by the data in this year's Review is that of a strong rebound of global energy consumption in 2010, following the global recession. Consumption growth reached 5.6%, the highest rate since 1973. It increased strongly for all forms of energy and in all regions. Total consumption of energy in 2010 easily surpassed the pre-recession peak reached in 2008. While consumption in emerging economies continued to rise rapidly, OECD countries also saw growth well above average. Globally, energy consumption grew more rapidly than the economy, meaning that the energy intensity of economic activity increased for a second consecutive year. The data implies that global CO<sub>2</sub> emissions from fossil fuel consumption will also have grown strongly last year.

These facts pose important questions for our industry and the countries where we produce and provide energy. They demonstrate the need to redouble efforts to reduce energy intensity and pursue a sustainable mix for the future. They also point to the need for continuing investment to provide the increasing volumes of energy that the world requires – all the time making sure that safety is our utmost priority, something of which we are very mindful in BP, following last year's tragedy in the Gulf of Mexico.

Encouragingly, last year, the strong recovery in energy consumption was accompanied by strong growth in production. However, energy prices diverged: oil prices rebounded globally, while natural gas and coal prices varied by region. Not surprisingly, higher prices meant that oil saw the weakest consumption growth among fossil fuels last year. OPEC production cuts, instituted during the global recession, remained in effect throughout 2010 (and so far this year) and informal production increases were not sufficient to avoid higher prices in the face of the strong recovery in consumption. Natural gas prices remained weak in North America – where production of shale gas continued to climb – and were on average lower in continental Europe, in part due to changes in contractual pricing arrangements. Global LNG and UK spot prices increased more strongly in the face of robust consumption growth. Coal prices grew robustly in Europe, but were weak in the US and Japan.

Events so far this year have kept the world's focus on energy: the tragic tsunami in Japan and unrest in the Arab world have disrupted energy flows, and rising prices 'at the pump' have raised concerns about slowing the economic recovery. In uncertain times such as these, the Statistical Review's long-standing focus on objective global energy data provides much-needed perspective to help inform thinking in business, governments and civil society. We hope that you will find this 60th edition to be a useful source of information and insight.

I would like to thank BP's economics team and all those around the world who have helped prepare this Review – in particular those in government in many countries who report the official data.

# 2010 in review

## Overview

Global energy consumption in 2010 rebounded strongly, driven by economic recovery. The growth in energy consumption was broad-based, with mature OECD economies joining non-OECD countries in growing at above-average rates. All forms of energy grew strongly, with growth in fossil fuels suggesting that global CO<sub>2</sub> emissions from energy use grew at the fastest rate since 1969.

Energy price developments were mixed. Oil prices remained in the \$70-80 range for much of the year before rising in the fourth quarter. With the OPEC production cuts implemented in 2008/09 still in place, average oil prices for the year as a whole were the second-highest on record. Natural gas prices grew strongly in the UK and in markets indexed to oil prices (including much of the world's LNG); but prices remained weak in North America – where shale gas production continued to increase – and in continental Europe (partly due to a growing share of spot-priced deliveries). Coal prices remained weak in Japan and North America, but rose strongly in Europe.

### Energy developments

World primary energy consumption – which this year includes for the first time a time series for commercial renewable energy – grew by 5.6% in 2010, the largest increase (in percentage terms) since 1973. Consumption in OECD countries grew by 3.5%, the strongest growth rate since 1984, although the level of OECD consumption remains roughly in line with that seen 10 years ago. Non-OECD consumption grew by 7.5% and was 63% above the 2000 level. Consumption growth accelerated in 2010 for all regions, and growth was above average in all regions. Chinese energy consumption grew by 11.2%, and China surpassed the US as the world's largest energy consumer. Oil remains the world's leading fuel, at 33.6% of global energy consumption, but oil continued to lose market share for the 11th consecutive year.

Global energy consumption;  
the strongest growth since 1973.

# +5.6%

China's share of global energy  
consumption; the world's largest.

# 20.3%

Dated Brent averaged \$79.50 per barrel in 2010, an increase of 29% from the 2009 but still nearly \$18 per barrel below the 2008 record level. Other benchmark crudes registered similar increases. Very strong consumption growth and continuing OPEC production restraint helped to push prices higher late in the year, with prices reaching a peak near \$94 at year-end.

After falling for two consecutive years, global oil consumption grew by 2.7 million barrels per day (b/d), or 3.1%, to reach a record level of 87.4 million b/d. This was the largest percentage increase since 2004 but still the weakest global growth rate among fossil fuels. OECD consumption grew by 0.9% (480,000 b/d), the first increase since 2005. Outside the OECD, consumption growth was a record 2.2 million b/d, or 5.5%. Growth remained robust in China and Middle Eastern countries, with Chinese consumption growing by 860,000 b/d or 10.4%. Driven by the economic recovery, middle distillates (+4.4%) were the fastest-growing refined product category globally.

Global oil production increased by 1.8 million b/d, or 2.2%, but did not match the rapid growth in consumption. The gains in production were shared between OPEC and non-OPEC producers. OPEC production cuts implemented late in 2008 were maintained throughout 2010, although relaxed production discipline and rising output not subject to production allocations resulted in an increase of 960,000 b/d, or 2.5%. The largest increases were in Nigeria (+340,000 b/d) and Qatar (+220,000 b/d).

Oil production outside OPEC grew by 860,000 b/d, or 1.8%, the largest increase since 2002. Growth was led by China – which recorded its largest production increase ever – the US, and Russia. Continued declines in Norway – which saw the world's largest decline – and the UK partly offset growth elsewhere. Non-OPEC countries

accounted for 58.2% of global oil production in 2010, roughly the same share as in 2000.

Global crude runs increased by 1.8 million b/d, or 2.4%. Non-OECD countries accounted for 85% of the increase, and for the first time accounted for a majority of global throughput. Chinese throughput grew by 1 million b/d, or 13.4%. Global refinery capacity utilization rose to 81.5%. Refining capacity increased by 720,000 b/d last year, the slowest growth since 2003. However, the aggregate growth figure hides net reductions in the OECD markets of Europe, Japan, the US and Canada. Capacity additions were concentrated in the non-OECD, with growth in China (640,000 b/d) accounting for almost 90% of the global total. Installed refining capacity in the non-OECD now exceeds that of the OECD by 1.5 million b/d.

After two consecutive declines, global oil trade grew by 2.2%, or 1.2 million b/d, with net Asia Pacific imports accounting for nearly 90% of the growth. Net imports grew robustly in China (+14.6%, 680,000 b/d) and Japan (+7.1%, 280,000 b/d). Net export growth was largely from the Former Soviet Union (+7.2%, 570,000 b/d) and the Middle East (+2.6%, 470,000 b/d). The growth in global trade was roughly split between crude and refined products, though crude still accounts for 70% of global oil trade.

Growth in global oil consumption;  
the weakest among fossil fuels.

**+3.1%**

## Natural gas

World natural gas consumption grew by 7.4%, the most rapid increase since 1984. Consumption growth was above average in all regions except the Middle East. The US had the world's largest increase in consumption (in volumetric terms), rising by 5.6% and to a new record high. Russia and China also registered large increases – the largest volumetric increases in the country's history in each case. Consumption in other Asian countries also grew rapidly (+10.7%), led by a 21.5% increase in India.

Global natural gas production grew by 7.3%. Production grew rapidly in Russia (+11.6%, with the world's largest volumetric increase), the US (+4.7%) and Qatar (+30.7%). The US remained the world's largest producer, with supply of unconventional gas continuing to grow despite weak North American natural gas prices (which traded at record discounts to crude oil in 2011) – while Canadian production saw the world's largest decline, falling for a fourth consecutive year.

Global natural gas trade increased by a robust 10.1% in 2010. A 22.6% increase in LNG shipments was driven by a 53.2% increase in Qatari shipments. Among LNG importers, the largest volumetric growth was in South Korea, the UK and Japan. LNG now accounts for 30.5% of global gas trade. Pipeline shipments grew by 5.4%, led by growth in Russian exports.

Natural gas consumption growth;  
the strongest since 1984.

# +7.4%

## Other fuels

Coal's share of global energy consumption; the highest since 1970.

# 29.6%

Share of renewables in global energy consumption.

# 1.8%

Chinese share of global coal consumption.

# 48.2%

Coal consumption grew by 7.6% in 2010, the fastest global growth since 2003. Coal now accounts for 29.6% of global energy consumption, up from 25.6% 10 years ago. Chinese consumption grew by 10.1%; China last year consumed 48.2% of the world's coal and accounted for nearly two-thirds of global consumption growth. But consumption growth was robust elsewhere as well: OECD consumption grew by 5.2%, the strongest growth since 1979, with strong growth in all regions. Global coal production grew by 6.3%, with China (+9%) again accounting for two-thirds of global growth. Elsewhere, coal production grew robustly in the US and Asia but fell in the EU, helping to explain the relative strength of coal prices in Europe.

Global hydroelectric and nuclear output each saw the strongest increases since 2004. Hydroelectric output grew by 5.3%, with China accounting for more than 60% of global growth due to a combination of new capacity and wet weather. Worldwide nuclear output grew by 2%, with three-quarters of the increase coming from OECD countries. French nuclear output rose by 4.4%, accounting for the largest volumetric increase in the world.

Other renewable energy sources continued to grow rapidly. Global biofuels production in 2010 grew by 13.8%, or 240,000 b/d, constituting one of the largest sources of liquids production growth in the world. Growth was driven by the US (+140,000 b/d, or 17%) and Brazil (+50,000 b/d, or 11.5%). Renewable energy used in power generation grew by 15.5%, driven by continued robust growth in wind energy (+22.7%). The increase in wind energy in turn was driven by China and the US, which together accounted for nearly 70% of global growth. These forms of renewable energy accounted for 1.8% of global energy consumption, up from 0.6% in 2000.

Additional information – including historical time series for the fuels reported in this Review; further detail on renewable forms of energy; and electricity generation – is available at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview).

#Excludes Lithuania and Slovenia in 1990.

•Remaining established reserves, less reserves 'under active development'.

**Notes: Proved reserves of oil** – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. **Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate. **Source of data** – The estimates in this table have been compiled using a combination of primary official sources, third-party data from the OPEC Secretariat, *Oil & Gas Journal* and an independent estimate of Russian reserves based on information in the public domain. Canadian proved reserves include an official 26.5 billion barrels for oil sands 'under active development'. Venezuelan reserves are taken from the *OPEC Annual Statistical Bulletin*, that noted in 2008 that the figure included 'proven reserves of the Magna Reserve Project in the Orinoco Belt, which amounted to 94,168mb'. Reserves include gas condensate and natural gas liquids (NGLs) as well as crude oil.

**Annual changes and shares of total are calculated using thousand million barrels figures.**

## Reserves-to-production (R/P) ratios

Years

### 2010 by region

### History

World proved oil reserves in 2010 were sufficient to meet 46.2 years of global production, down slightly from the 2009 R/P ratio because of a large increase in world production; global proved reserves rose slightly last year. An increase in Venezuelan official reserve estimates drove Latin America's R/P ratio to 93.9 years – the world's largest, surpassing the Middle East.

## Distribution of proved reserves in 1990, 2000 and 2010

### Production by region

Million barrels daily

### Consumption by region

Million barrels daily

World oil production increased by 1.8 million b/d in 2010; growth was broadly-based, with increases in all regions except Europe & Eurasia. Moreover, growth was broadly split between OPEC and non-OPEC countries. World oil consumption increased by 2.7 million b/d; growth was above average in all regions, although Asia Pacific countries accounted for the majority (54%) of global consumption growth.

### Consumption per capita 2010

Tonnes

## Regional consumption by product group

## Refinery utilization

Percentage

Global crude runs grew by 1.8 million b/d in 2010, led by a 1 million b/d increase in China. For the first time, refinery throughputs in the non-OECD exceeded those of the OECD. Most of the 0.7 million b/d increase in global refining capacity last year was also in China. Installed capacity in the non-OECD is now 1.5 million b/d above that of the OECD. Global average refinery utilization improved to 81.5%, the first increase since 2005.

## Regional refining margins

US dollars per barrel

**Note:** The refining margins presented are benchmark margins for three major global refining centres. US Gulf Coast (USGC), North West Europe (NWE – Rotterdam) and Singapore. In each case they are based on a single crude oil appropriate for that region and have optimized product yields based on a generic refinery configuration (cracking, hydrocracking or coking), again appropriate for that region. The margins are on a semi-variable basis, i.e. the margin after all variable costs and fixed energy costs.

n/a not available.

**Notes: Proved reserves of natural gas** – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. **Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate. **Source of data** – The estimates in this table have been compiled using a combination of primary official sources and third-party data from Cedigaz and the OPEC Secretariat.

## Reserves-to-production (R/P) ratios

Years

### 2010 by region

### History

World natural gas proved reserves in 2010 were sufficient to meet 58.6 years of global production. R/P ratios declined for each region, driven by rising production. The Middle East once again had the highest regional R/P ratio, while Middle East and Former Soviet Union regions jointly hold 72% of the world's gas reserves.

## Distribution of proved reserves in 1990, 2000 and 2010

\*Excluding gas flared or recycled.

Source: Includes data from Cedigaz.

♦Less than 0.05%.

Notes: As far as possible, the data above represents standard cubic metres (measured at 15°C and 1013 mbar); because it is derived directly from tonnes of oil equivalent using an average conversion factor, it does not necessarily equate with gas volumes expressed in specific national terms.

Annual changes and shares of total are calculated using million tonnes of oil equivalent figures.

Natural gas production data expressed in billion cubic feet per day is available at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview).

## Production by region

Billion cubic metres

## Consumption by region

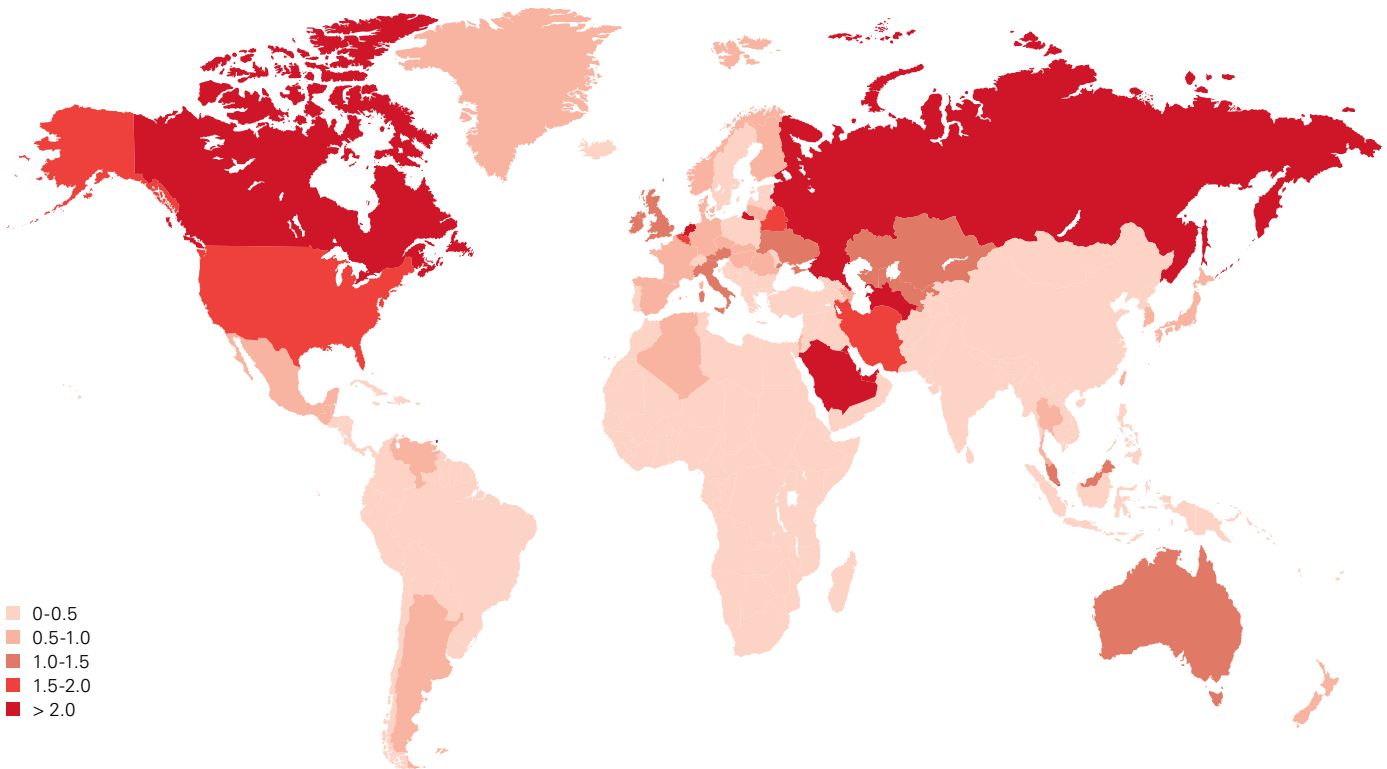

Billion cubic metres

World natural gas production increased by 7.3%, the largest increase since 1984. Growth was above average in all regions; Russia recorded the largest production increment. Natural gas consumption increased by 7.4%, with above-average growth in all regions but the Middle East. The US recorded the world's largest gas consumption increment.

## Natural gas: trade movements 2010

Numbers in blue refer to liquefied natural gas (LNG) trade

Numbers in black refer to pipeline trade

Numbers in red refer to both pipeline and LNG trade

Fold out to see full table

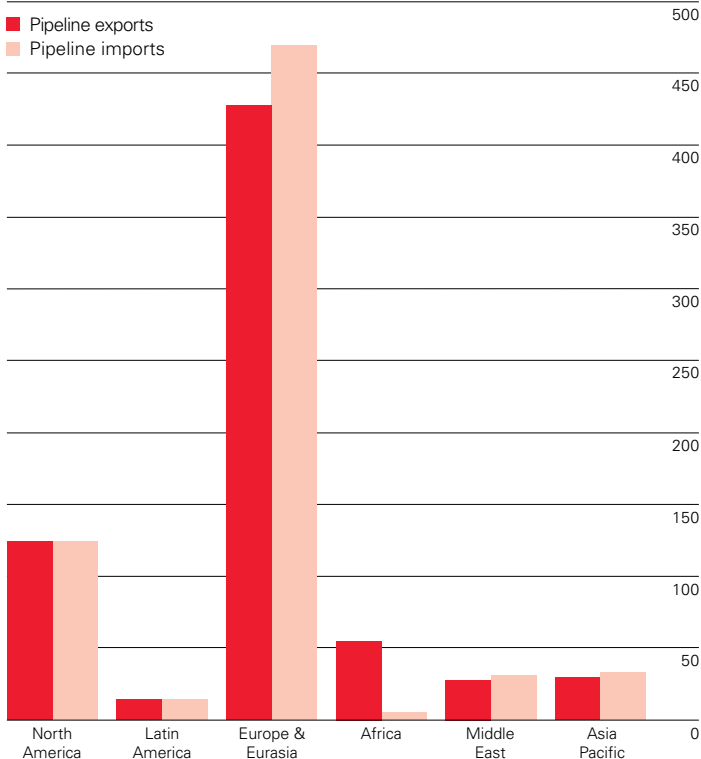

## Major trade movements

Trade flows worldwide (billion cubic metres)

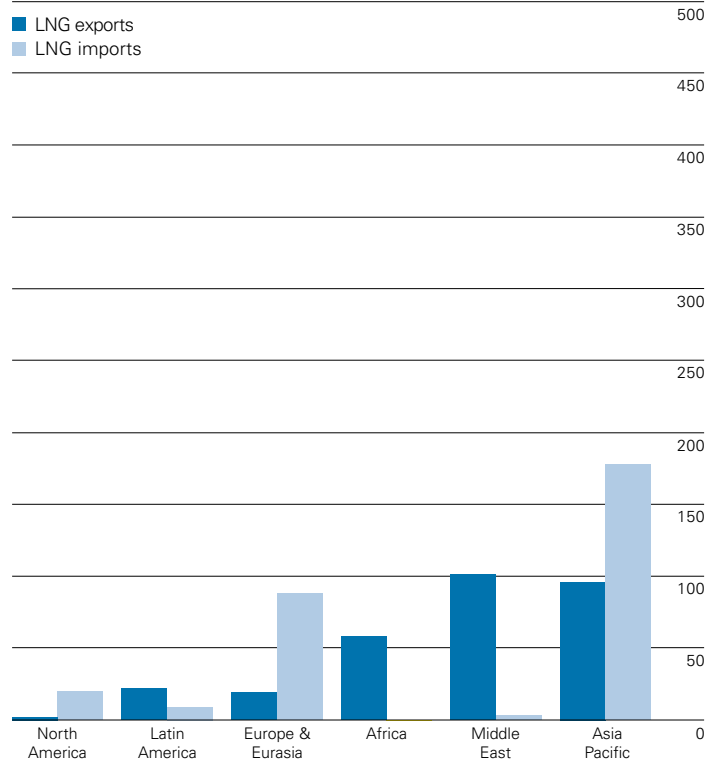

## Natural gas trade

### Pipeline exports and imports

### LNG exports and imports

Natural gas trade grew by 10.1% in 2010, driven by strong growth (+22.6%) in LNG shipments. LNG exports are dominated by the Middle East region; Qatar (the world's largest LNG supplier) saw its exports grow by 53.2%. LNG now accounts for 30.5% of global gas trade. Pipeline shipments grew by 5.4%, led by growth in Russia. Europe and Eurasia accounts for roughly two-thirds of global pipeline gas trade.

Source of reserves data: Survey of Energy Resources, World Energy Council 2010.

**Notes: Proved reserves of coal** – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known deposits under existing economic and operating conditions. **Reserves-to-production (R/P) ratio** – If the reserves remaining at the end of the year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

## Reserves-to-production (R/P) ratios

Years

2010 by region

History

World proved reserves of coal in 2010 were sufficient to meet 118 years of global production – by far the largest R/P ratio of any fossil fuel, but well below the 2000 R/P ratio of 210 years. Europe & Eurasia holds the largest regional coal reserves and has the highest regional R/P ratio.

## Distribution of proved reserves in 1990, 2000 and 2010

Percentage

- Europe & Eurasia
- Asia Pacific
- North America
- Middle East & Africa
- S. & Cent. America

♦Less than 0.05%.

### Production by region

Million tonnes oil equivalent

### Consumption by region

Million tonnes oil equivalent

World coal production grew by 6.3% in 2010, above the historical average. The Asia Pacific region accounted for 88.6% of global growth, led by a 9% increase in China – the world’s largest producer and consumer of coal. Global coal consumption grew by 7.6% in 2010, with Asia Pacific countries accounting for 79.7% of the increase. Consumption growth was above average in all regions except the Middle East and Africa.

### Consumption per capita 2010

\*Based on gross primary hydroelectric generation and not accounting for cross-border electricity supply. Converted on the basis of thermal equivalence assuming 38% conversion efficiency in a modern thermal power station.

†Less than 0.05.

♦Less than 0.05%.

Note: Hydroelectricity data expressed in terawatt-hours is available at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview).

### Nuclear energy consumption by region

Million tonnes oil equivalent

World nuclear power generation grew by 2% in 2010. Nearly two-thirds of the growth was in Europe and Eurasia, with France recording the world's largest incremental growth. Global hydroelectric output rose by 5.3%, double the historical average; Asia Pacific countries accounted for 72.1% of global growth.

### Hydroelectricity consumption by region

Million tonnes oil equivalent

### Other renewables consumption by region

Million tonnes oil equivalent

### Other renewables share of power generation by region

Percentage

Renewable energy in power generation grew by 15.5% in 2010 and accounted for 1.3% of global primary energy consumption. Growth remains concentrated in the leading consuming centres: Europe and Eurasia, Asia Pacific, and North America. Renewable forms of energy account for 3.3% of global power generation, with the highest share (5.8%) in Europe and Eurasia.

Source: Includes data from F.O. Licht; US Energy Information Administration.

Note: Consumption of fuel ethanol and biodiesel is included in oil consumption.

## World biofuels production

Million tonnes oil equivalent

World biofuels production grew by 13.8% in 2010; biofuels accounted for 0.5% of global primary energy consumption. Growth was driven by North America (+17.7%) and South and Central America (+14.2%); these two regions accounted for three-quarters of global biofuels production. Ethanol accounts for nearly three-quarters of global biofuels production, and is dominant in North America and South and Central America; biodiesel is dominant in Europe and Eurasia.

# ① Primary energy

## World consumption

Million tonnes oil equivalent

World primary energy consumption grew by 5.6% in 2010, the strongest growth since 1973. Growth was above average for oil, natural gas, coal, nuclear, hydroelectricity, as well as for renewables in power generation. Oil remains the dominant fuel (33.6% of the global total) but has lost share for 11 consecutive years. The share of coal in total energy consumption continues to rise, and the share of natural gas was the highest on record.

## Regional consumption pattern 2010

Percentage

The Asia Pacific region continues to lead global energy consumption, accounting for 38.1% of the world total and for 67.1% of global coal consumption. Within the Asia Pacific countries, coal is the dominant fuel, accounting for 52.1% of energy consumption. Oil is the dominant fuel for all other regions except Europe and Eurasia, where natural gas is the leading fuel. In addition to being the largest consumer of coal, the Asia Pacific countries are also the leading users of oil and hydroelectric generation. Europe and Eurasia are leading consumers of natural gas, nuclear power, and renewables in power generation.

## Consumption per capita 2010

Tonnes oil equivalent

## Fossil fuel reserves-to-production (R/P) ratios at end 2010

Years

Coal remains the most abundant fossil fuel by global R/P ratios, though oil and natural gas proved reserves have generally risen over time. Non-OECD countries account for 93.4% of the world's proved oil reserves; 90.9% of natural gas reserves, and 56% of coal reserves. The Middle East holds the largest share of proved oil and natural gas reserves; Europe and Eurasia hold a significant share of the world's natural gas and the largest coal reserves. Asia and North America also hold substantial coal reserves.

Australia, New Zealand.

#### OECD members

**Europe:** Austria, Belgium, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Republic of Ireland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, UK.

**Other member countries:** Australia, Canada, Chile, Israel, Japan, Mexico, New Zealand, South Korea, US.

#### OPEC members

**Middle East:** Iran, Iraq, Kuwait, Qatar, Saudi Arabia, United Arab Emirates.

**North Africa:** Algeria, Libya.

**West Africa:** Angola, Nigeria.

**South America:** Ecuador, Venezuela.

### Units

1 metric tonne	= 2204.62lb = 1.1023 short tons
1 kilolitre	= 6.2898 barrels = 1 cubic metre
1 kilocalorie (kcal)	= 4.187kJ = 3.968Btu
1 kilojoule (kJ)	= 0.239kcal = 0.948Btu
1 British thermal unit (Btu)	= 0.252kcal = 1.055kJ
1 kilowatt-hour (kWh)	= 860kcal = 3600kJ = 3412Btu

### Calorific equivalents

One tonne of oil equivalent equals approximately:

<b>Heat units</b>	10 million kilocalories 42 gigajoules 40 million British thermal units
<b>Solid fuels</b>	1.5 tonnes of hard coal 3 tonnes of lignite
<b>Gaseous fuels</b>	See Natural gas and liquefied natural gas table
<b>Electricity</b>	12 megawatt-hours

One million tonnes of oil or oil equivalent produces about 4400 gigawatt-hours (= 4.4 terawatt-hours) of electricity in a modern power station.

1 barrel of ethanol = 0.57 barrel of oil  
1 barrel of biodiesel = 0.88 barrel of oil

### European Union members

Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Republic of Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, UK.

### Non-OECD

All countries that are not members of the OECD.

### Methodology

The primary energy values of nuclear and hydroelectric power generation, as well as electricity from renewable sources, have been derived by calculating the equivalent amount of fossil fuel required to generate the same volume of electricity in a thermal power station, assuming a conversion efficiency of 38% (the average for OECD thermal power generation). Fuels used as inputs for conversion technologies (gas-to-liquids, coal-to-liquids and coal-to-gas) are counted as production for the source fuel and the outputs are counted as consumption for the converted fuel.

### Percentages

Calculated before rounding of actuals. All annual changes and shares of totals are on a weight basis except on pages 6, 13, 16, 18 and 20.

### Rounding differences

Because of rounding, some totals may not agree exactly with the sum of their component parts.

### Tonnes

Metric equivalent of tons.

## More information

The data in this publication is also available at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview). In addition to viewing, data can be downloaded and charted using the charting tool.

### Questions on data

BP regrets it is unable to deal with enquiries about the data in *BP Statistical Review of World Energy June 2011*.
