#### **Reaction Setup**

**Powder mixing** 

**High-energy ball-milling for several hours** 

Ball-to-powder ratio (20:1)

Vial (250 ml) and balls (d = 10-20 mm)

WC, stainless steel, zirconia

250 rotations per minute

**Controlled atmosphere** 

Particles repeatedly subjected to deformation, cold welding, and fracture, homogenization on an atomic scale

On impact, high energy concentrated in a small spot, stress 200 MPa, duration of microseconds

Fragmentation, atomically clean surface exposed

**Balance between fragmentation and coalescence** 

Grain size ~10 nm

Amorphization, product nucleation and crystallization

#### **→** Phase Transitions (to denser structures)

Oxide	Before	$V, A^3$	After	$V, A^3$
GeO <sub>2</sub>	quartz	40.3	rutile	27.6
TiO <sub>2</sub>	anatase	34.1	rutile	31.2
ZrO <sub>2</sub>	baddaleyite	35.2	fluorite	32.8

V = volume per formula unit

#### **→** Mechanical Alloying

$$Ni + Nb$$
  $\longrightarrow$   $Nb_{40}Ni_{60}$  amorphous

#### **→** Preparation of mixed oxides

#### **→** Preparation of chalcogenides

Fe (powder 4 
$$\mu$$
m) + S (50  $\mu$ m) — FeS in Argon ZnCl<sub>2</sub> + Na<sub>2</sub>S — ZnS + 2 NaCl CdCl<sub>2</sub> + Na<sub>2</sub>S — CdS + 2 NaCl

→ Preparation of carbides, borides, nitrides, silicides

Nb + C (graphite) 
$$\longrightarrow$$
 NbC (Fe impurities from abrasion)

Nb + C + Cu + Fe  $\longrightarrow$  NbC/Cu/Fe cermet

Ti + N<sub>2</sub>  $\longrightarrow$  TiN 60 h

Ti + C  $\longrightarrow$  TiC 35 h

Ti + 2 B  $\longrightarrow$  TiB<sub>2</sub> 15 h

TiO<sub>2</sub> + 2 Mg + C  $\longrightarrow$  TiC + 2 MgO

$$WO_3 + 3 Mg + C \rightarrow \alpha - W + 3 MgO + C$$
 explosive

(MgO removed by HCl)

$$\alpha$$
-W + 3 MgO + C  $\longrightarrow$  WC 50 h (4-20 nm, MgO removed by HCl)

#### **→** Reactive milling

$$Na_2CO_3 + SeO_2 \longrightarrow Na_2SeO_3 + CO_2$$

$$2In + 3 urea.H_2O_2 + SnO_2 \longrightarrow In_2O_3 + SnO_2 + 3 H_2O + 3 urea$$

heating to 473 K for 4h to remove organics and calcination at 573-673 K in oxygen gives ITO

$$FeCl_2 + 2 CpNa \rightarrow 2 NaCl + Cp_2Fe$$

#### **Polymer Pyrolysis**

## Preparation of: powders, monoliths, fibers, films, impregnation (PIP)

**Example: SiC fibers** 

**©** polymer synthesis

$$Me_2SiCl_2 + MePhSiCl_2 \xrightarrow{Na} [-SiMe_2-SiMePh-]_n$$

- **©** melt spinning or drawing from solution gives continuous polymer fiber
- © curing in O<sub>2</sub>, heat to 400 500 °C, thermoset, crosslinking to prevent melting
- © pyrolysis at 1000 1500 °C to polyxtalline β-SiC fiber

### **Polymer Pyrolysis**

Cl-CH<sub>2</sub>-SiCl<sub>3</sub>

$$\begin{array}{c|c} \text{Cl}_3\text{Si-CH}_2\text{-Cl} \\ \hline 1. \text{ Mg, Ether} \\ 2. \text{ LiAlH}_4 \\ \hline \text{H} \qquad & \mathsf{CH}_2 \\ \mathsf{H-Si-CH}_2\mathsf{L--[Si-CH}_2]_Z\text{-}[Si-CH}_2\mathsf{L--[Si-CH}_2]_X\text{-} \\ \text{H} \qquad & \mathsf{H} \qquad & \mathsf{CH}_2 \\ \end{array}$$

 $(SiCH_4)_n$ 

#### **Polymer Pyrolysis**

BN

$$B_{10}H_{14} + en \longrightarrow polymer \xrightarrow{1300 \text{ K, NH}_3} BN powder$$

**AIN** 

Al 
$$\xrightarrow{\text{anodic dissolution}}$$
 Al(NHR)<sub>3</sub>  $\longrightarrow$  Al<sub>2</sub>(NR)<sub>3</sub> polymeric gel

Thermolysis of Organometallic Coordination Polymers

$$(Me_3Sn)_nM(CN)_6$$
 n = 3,4; M = Fe, Co, Ru

thermolysis in Ar or H<sub>2</sub> gives intermetallics FeSn<sub>2</sub>, CoSn<sub>2</sub>, Ru<sub>3</sub>Sn<sub>7</sub> thermolysis in air gives oxides Fe<sub>2</sub>O<sub>3</sub>/SnO<sub>2</sub>, Co<sub>2</sub>SnO<sub>4</sub>, RuO<sub>2</sub>

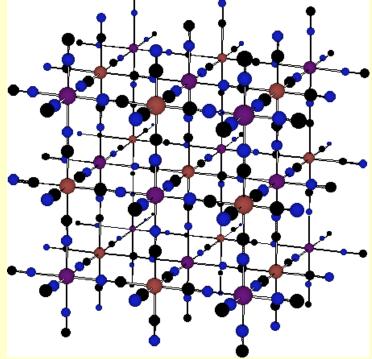

# Thermolysis of Organometallic Coordination Polymers

 $(Me_3Sn)_nM(CN)_6$  n = 3,4; M = Fe, Co, Ru

thermolysis in Ar or H<sub>2</sub> gives intermetallics

FeSn<sub>2</sub>, CoSn<sub>2</sub>, Ru<sub>3</sub>Sn<sub>7</sub>

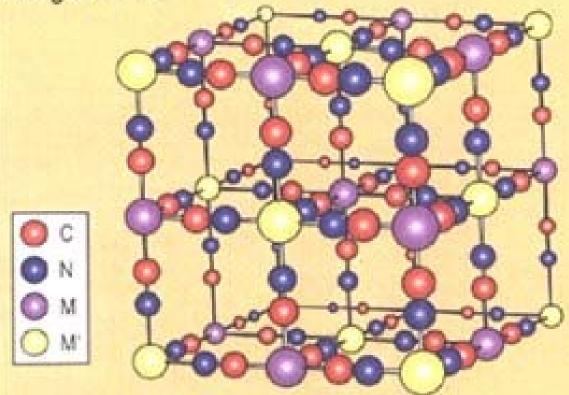

thermolysis in air gives oxides Fe<sub>2</sub>O<sub>3</sub>/SnO<sub>2</sub>, Co<sub>2</sub>SnO<sub>4</sub>, RuO<sub>2</sub>

### Prussian Blue structure

11

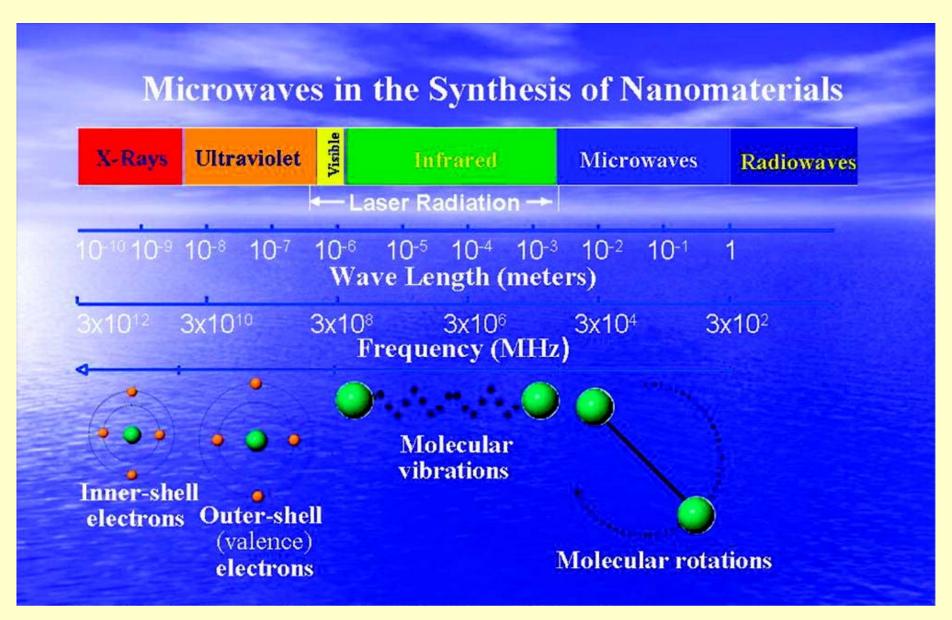

An idealised structure of Prussian Blue with M←C=N→M' linkages in 3-D

When M = Cr, M' = Ni material is a ferromagnet,  $T_c$  = 90K When M= V, M' = Mn material is a ferrimagnet,  $T_c$  = 125K When M= Cr, M' = V material is a ferrimagnet,  $T_c$  = 315K

Microwave radiation = electromagnetic radiation Microwaves:  $\lambda = 1$  mm to 1m,  $\nu = 0.3$  to 300 GHz Microwave ovens 2.45 GHz,  $\lambda = 12.24$  cm power up to 1 kW, pulses, magnetron, microwaveguide, microwave cavity

All kitchen microwave ovens and all microwave reactors for chemical synthesis operate at a frequency of 2.45 GHz to avoid interference with telecommunication and cellular phone frequencies.

The energy of the microwave photon in this frequency region

too low to break chemical bonds (0.0016 eV) lower than the energy of Brownian motion

Microwaves cannot induce chemical reactions

Microwave-enhanced chemistry is based on the heating of materials by "microwave dielectric heating" effects = the ability of a material (solvent or reagent) to absorb microwave energy and convert it into heat

**Interaction of materials with microwaves:** 

**★** transmitters: quartz, zircon, glasses, ceramics (no TM), Teflon

**★** absorbers: amorphous carbon, graphite, powdered metals, metal oxides, sulfides, halides, water

#### **Dielectric heating**

electric dipole reorientation in the applied alternating field

the dipoles or ions aligning in the applied electric field applied field oscillates, the dipole or ion field attempts to realign itself with the alternating electric field energy is lost in the form of heat through molecular friction and dielectric loss

if the dipole does not have enough time to realign, or reorients too quickly with the applied field, no heating occurs

Resistive heating polarization current, a reorientation phase lag

Joule heating ionic current, ionic conduction, ions drift in the applied field

**Electronic transport** metal powders, semimetallic and semiconducting materials

Rotational excitation: weak bonds (interlayer bonds in graphite and other layer materials

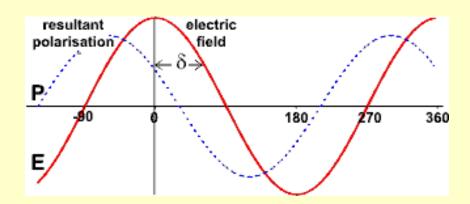

Eddy currents: metal powders, alternating magnetic fields Microwave absorption = f (frequency, temperature) Thermal runaway = increased dielectric loss at higher T

### **Dielectric Heating**

#### The applied field potential E of electromagnetic radiation

$$E = E_{max}.cos(\omega \tau)$$

 $E_{max}$  = the amplitude of the potential (V)  $\omega$  = the angular frequency (rad s<sup>-1</sup>)  $\tau$  = the time (s)

If the polarization lags behind the field by the phase  $(\delta, radians)$  then the polarization (P, coulombs) varies as

$$P = P_{\text{max}} \cdot \cos(\omega \tau - \delta)$$

P<sub>max</sub> is the maximum value of the polarization

#### **Dielectric Heating**

The current (I, A) varies as

$$I = (dP/dt) = -\omega P_{max} \sin(\omega \tau - \delta)$$

The power (P, watts) given out as heat is the average value of (current x potential).

*P* is zero if there is no lag (*i.e.* if  $\delta = 0$ ), otherwise

$$P = 0.5 P_{\text{max}} E_{\text{max}} \omega.\sin(\delta)$$

#### **Dielectric Properties**

The ability of a substance to convert electromagnetic energy into heat at a given frequency and temperature

Loss factor  $\tan \delta = \epsilon''/\epsilon'$ 

 $\epsilon$ " is the dielectric loss, indicative of the efficiency of radiation-to-heat conversion

e' is the dielectric constant, the ability of molecules to be polarized by the electric field

a high  $tan\delta$  value required for efficient absorption and for rapid heating

solvents can be classified as microwave absorbing

high  $(\tan \delta > 0.5)$ 

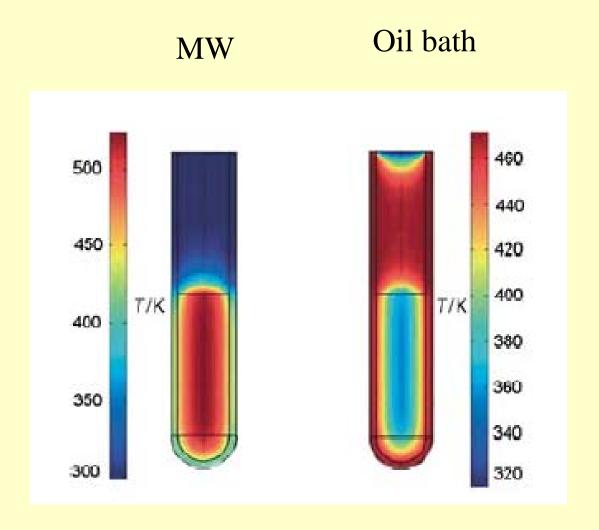

medium ( $\tan \delta = 0.1 - 0.5$ )

low  $(\tan \delta < 0.1)$ 

## Loss factors ( $\tan\delta$ ) of different solvents (2.45 GHz, 20 °C)

Solvent	tanδ	Solvent	tanδ
ethylene glycol	1.350	DMF	0.161
ethanol	0.941	1,2-dichloroethane	0.127
DMSO	0.825	water	0.123
2-propanol	0.799	chlorobenzene	0.101
formic acid	0.722	chloroform	0.091
methanol	0.659	acetonitrile	0.062
nitrobenzene	0.589	ethyl acetate	0.059
1-butanol	0.571	acetone	0.054
2-butanol	0.447	tetrahydrofuran	0.047
1,2-dichlorobenzen	e 0.280	dichloromethane	0.042
NMP	0.275	toluene	0.040
acetic acid	0.174	hexane	0.020

## **Temperature Gradients**

**Examples of Microwave-assisted syntheses** 

Si + C  $\rightarrow$   $\beta$ -SiC  $\Delta G^{\circ}_{298}$  = - 64 kJ/mol silica crucible, 1 kW, 4-10 min, 900 °C, inert ambient (I<sub>2</sub>), conventional process requires 1400 °C

metal + chalcogenide → ME evacuated quartz ampoules, 5-10 min, 900 W, melting, light emission PbSe, PbTe, ZnS, ZnSe, ZnTe, Ag<sub>2</sub>S

Mo + Si + graphite → MoSi<sub>2</sub> high mp, oxidation and carbidation resistance, metallic conductivity, heating elements and high-T engine parts

Mixed oxides  $Y_2O_3 + BaO + CuO \longrightarrow YBa_2Cu_3O_{7-x}$  200 W, 25 min

BaO + WO<sub>3</sub> 
$$\longrightarrow$$
 BaWO<sub>3</sub> 500 W, 30 min

Amorphous carbon is a secondary susceptor, does not react with reagents or products (carbothermal reduction)
C burns and initiates decomposition of carbonates or nitrates

$$BaCO_3 + TiO_2 + C \rightarrow BaTiO_3 + CO_2$$

$$PbNO_3 + TiO_2 + C \longrightarrow PbTiO_3 + CO_2$$

NaH<sub>2</sub>PO<sub>4</sub>.2H<sub>2</sub>O good MW susceptor, rotational excitation of water, dehydrates to NaPO<sub>3</sub>, melts, 700 °C in 5 min

Na<sub>2</sub>HPO<sub>4</sub>.2H<sub>2</sub>O, KH<sub>2</sub>PO<sub>4</sub> no MW heating

#### Microvawe-Active Elements, Natural Minerals, and Compounds (2.45 GHz, 1 kW)

		1	1	1	
element/ mineral/compound	time (min) of microvawe exposure	T, K	element/ mineral/compound	time (min) of microvawe exposure	T, K
