## Foreword

INSPIRE is a Directive providing general rules for the establishment of an Infrastructure for Spatial Information in Europe. The purpose of such an infrastructure is to assist policy-making in relation to policies that may have a direct or indirect impact on the environment.

INSPIRE should be based on the infrastructures for spatial information that are created by the Member States and are designed to ensure that spatial data are stored, made available and maintained at the most appropriate level; that it is possible to combine spatial data from different sources across the Community in a consistent way and share them between several users and applications; that it is possible for spatial data collected at one level of public authority to be shared between other public authorities; that spatial data are made available under conditions which do not unduly restrict their extensive use; that it is easy to discover available spatial data, to evaluate their suitability for the purpose and to know the conditions applicable to their use. For these reasons, the Directive focuses in particular on five key areas: metadata, the interoperability and harmonisation of spatial data and services for selected themes (as described in Annexes I, II, III of the Directive); network services and technologies; measures on sharing spatial data and services; coordination and monitoring measures.

The text of the INSPIRE Directive agreed by Parliament and Council is available from the INSPIRE web site ([www.ec-gis.org/inspire](http://www.ec-gis.org/inspire)). The Directive, which is expected to be adopted in February 2007, identifies what needs to be achieved, and Member States have two years from the date of adoption to bring into force national legislation, regulations, and administrative procedures that define how the agreed objectives will be met taking into account the specific situation of each Member State. To ensure that the spatial data infrastructures of the Member States are compatible and usable in a Community and transboundary context, the Directive requires that common Implementing Rules (IR) are adopted in a number of specific areas. These IRs are adopted as Commission Decisions, and are binding in their entirety. The Commission is assisted in the process of adopting such rules by a regulatory committee composed by representatives of the Member States and chaired by a representative of the Commission (this is known as the Comitology procedure). The committee will be established within three months from the entry in force of the Directive.

IRs on metadata need to be adopted within one year of the entry in force of the Directive, i.e. by early March 2008. The Commission will make a proposal to the committee, which has three months to deliver its opinion. If the committee agrees with the proposal, the IR is adopted. If the committee does not agree, or does not deliver an opinion, then the Commission needs to submit the proposal to the Council and inform the European Parliament. If Parliament considers that the proposal submitted by the Commission exceeds the implementing powers provided for by the INSPIRE Directive, it informs the Council of its position. The Council votes by qualified majority on the proposal. If the Council agrees with the proposal or does not indicate opposition, the IR is adopted by the Commission. If the Council opposes the measure, the Commission will have to submit a revised proposal<sup>1</sup>.

In order to prepare the Commission proposal, an international team of experts has been working since October 2005 to review available reference material and international standards to come to a draft proposal fulfilling the requirements of the Directive. This document presents this draft. The next three sections review the requirements as set in the Directive, explain the broader context within which the drafting team has operated, and define the scope of this document respectively.

---

<sup>1</sup> A precise explanation of the regulatory procedure to be used for the IR on metadata and monitoring measures is contained in Article 5 of Council Decision 1999/468/EC, amended by Decision 2006/512/EC of the 17 July 2006. IR for the interoperability and harmonisation of spatial data sets and services, network services, and data sharing need to follow the regulatory procedure with scrutiny detailed in Art. 5a of the same Council Decision. See: <http://eur-lex.europa.eu/LexUriServ/site/en/consleg/1999/D/01999D0468-20060723-en.pdf>

## The Directive's Requirements for Metadata

The general principle informing the need for metadata is expressed in Paragraph (6) of the Directive's preamble, i.e. that the "infrastructures for spatial information in the Member States should be designed to ensure that [...] it is easy to discover available spatial data, to evaluate their suitability for the purpose and to know the conditions applicable to their use".

Metadata is defined in Art. 3, point (6) as: "information describing spatial data sets and spatial data services and making it possible to discover, inventory and use them."

Art. 5 is dedicated to Metadata and requires the following:

*1. Member States shall ensure that metadata are created for the spatial data sets and services corresponding to the themes listed in Annexes I, II and III, and that those metadata are kept up to date.*

*2. Metadata shall include information on the following:*

- (a) the conformity of spatial data sets with the implementing rules provided for in Article 7(1);*
- (b) conditions applying to access to, and use of, spatial data sets and services and, where applicable, corresponding fees;*
- (c) the quality and validity of spatial data sets;*
- (d) the public authorities responsible for the establishment, management, maintenance and distribution of spatial data sets and services;*
- (e) limitations on public access and the reasons for such limitations, in accordance with Article 13.*

*3. Member States shall take the necessary measures to ensure that metadata are complete and of a quality sufficient to fulfil the purpose set out in point (6) of Article 3.*

*4. Rules for the implementation of this Article shall be adopted by one year following the date of entry into force of this Directive in accordance with the regulatory procedure referred to in Article 22(2). These rules shall take account of relevant, existing international standards and user requirements, in particular with relation to validation metadata.*

The timetable for the creation of metadata is set out in Art. 6, and indicate that metadata for the data themes in Annexes I and II of the Directive should be created no later than 2 years following the adoption of the IRs (i.e. by March 2010) and for Annex III no later than 5 years following the adoption of the IR (i.e. March 2013).

Additional requirements for Metadata come in Art. 11-1 (a) and 11-2 in which Member States are required to establish and operate discovery services making it possible to search for spatial data sets and services on the basis of the corresponding metadata, and to display the content of such metadata, based at a minimum on the following criteria:

- (a) keywords;*
- (b) classification of spatial data and services;*
- (c) the quality and validity of spatial data sets;*
- (d) degree of conformity with the implementing rules provided for in Article 7(1);*
- (e) geographical location;*
- (f) conditions applying to the access to and use of spatial data sets and services;*
- (g) the public authorities responsible for the establishment, management, maintenance and distribution of spatial data sets and services.*

Separate IRs for discovery services are being prepared and are not the subject of this document.

## The Broader Context

The implementation of INSPIRE should not be undertaken in isolation but should consider both international global initiatives such as GMES, Galileo and GEO to which many EU Member State institutions participate, and the harmonisation efforts ongoing at national level and across several thematic communities. With this in mind, the INSPIRE Work-programme 2005-06 introduced the concept of Spatial Data Interest Communities (SDICs) and Legally Mandated Organisations (LMOs) to provide a mechanism for stakeholders to participate in the development of the draft Implementing Rules. The Work Programme identified SDICs as self-organised communities bringing together the human expertise, technical competence, financial resources and policies of users, producers and transformers of spatial information organized by geographic region, societal sector or thematic issue. LMO represent instead those organizations at local, regional, national, or international level that have a formal legal mandate giving them the responsibility for specific thematic data resources. An open call was launched on March 11<sup>th</sup> 2005 for the registration of interest SDICs and LMOs. The roles of these organizations are:

- to identify and describe user requirements;
- to provide expertise to INSPIRE Drafting Teams;
- to participate in the review process of the draft Implementing Rules;
- to develop, operate and evaluate implementation pilot;
- to develop initiatives for guidance, awareness raising and training in relation with the INSPIRE implementation.

The call was enormously successful, and by the 29<sup>th</sup> April 2005, the following had registered on the INSPIRE web site<sup>2</sup>:

- Spatial Data Interest Communities (SDICs): 133
- Legally Mandate Organisations (LMOs): 82
- Proposed Experts: 180
- Referenced Materials: 90
- Identified Projects: 91

Drafting Teams were established on the basis of the proposal received, and the advice of the INSPIRE Expert Group, and started operating in October 2005. Their terms of reference are:

- To analyse and review the reference material provided by the SDICs;
- To demand further input from SDICs if required;
- To write the draft INSPIRE Implementing Rules;
- To provide recommendations to the Commission in case of conflicting technical specifications or issues;
- To provide suggestions to the Commission regarding the testing of any proposed technical specifications.

This document is a first public draft from the Drafting Team Metadata in writing the Implementing rules. By the realisation of this document the Drafting team has used the following information/projects:

- Requirements for metadata for spatial resources (data and services) as expressed in the INSPIRE Directive (see previous section).
- Metadata reference material from the SDICs and LMOs (Deliverable 1.2: Analysis of Reference Documentation, available on the INSPIRE web site)
- Experience from the JRC Tender: Supply of software for distributed Metadata Catalogue services to support the EU Portal (period: February – May 2006)
- Knowledge and reference material from the Drafting Team members
- Exchange of information between the different Drafting Teams and the European Commission.

---

<sup>2</sup> The call for registration remains open, and more organisations have registered since April 2005.

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataIRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 9 of 104

This document represents the contribution of the Metadata Drafting Team. The document is organized into 7 chapters and 10 annexes. Chapters 1 to 3 set the scope of the document, list normative references and provide a glossary of relevant terms. Chapter 4 outlines the underlying vision on metadata. In accordance with the INSPIRE Directive, three different types or levels of metadata are distinguished: metadata for discovery, metadata for evaluation, and metadata for use. In addition, metadata on metadata are needed for the management of metadata catalogues. Chapter 5 specifies concrete implementing rules for metadata for discovery. They are followed by general implementing rules for metadata on metadata in chapter 6. Abstract implementing rules for evaluation-metadata and use-metadata are provided in chapters 7 and 8. Among others, the annexes provide a mapping between discovery-level metadata and the relevant international standards (ISO 15836-Dublin Core and ISO 19115/19119).

The document is open for the review process described in Section: "Purpose of the Document".

## Purpose of the document

This document contains the Metadata Drafting Team's proposal for the technical content of the INSPIRE draft Implementing Rules for Metadata. A preliminary version of this draft (version 1) has already been revised in the light of comments from the other INSPIRE drafting teams, and the Commission.

This draft (Version 2.) is published on the INSPIRE web site on 2<sup>nd</sup> February 2007 for public view, but comments are restricted at this stage to registred SDICs and LMOs, through their contact person, and the INSPIRE Expert Group. The individuals concerned have been notified of the procedure to comment on this draft. The period to provide comments is set at 8 weeks form the day of publication i.e. 2007-03-30.

After the comments have been received and processed, a revised draft (Version 3) will be published on the INSPIRE web site by Summer 2007 for public consultation. There will be 8 weeks for anybody to comment following the procedre that will be published at the time.

At the end of the phase of public consultation, the Commission will elaborate its proposal and submit it to the committee required by the Directive, and enter the process explained in the Foreword of this document.

The document will be publicly available as a 'non-paper', as it does not represent an official position of the Commission, and as such can not be invoked in the context of legal procedures.
---

# 1 Scope

The scope of this document is the technical content of the Metadata Implementing Rules (IRs) that will detail the INSPIRE legislative requirements for metadata so that these can be implemented consistently across Europe. This document focuses on the semantic description of the metadata elements to describe spatial resources. The elements are described at an abstract level in order to make the IRs independent of any specific encoding or of any possible future changes to existing standards.

The starting point is the text for the INSPIRE Directive agreed by Parliament and Council and published on the INSPIRE web site. The specific requirements for metadata have also been reported in a previous section of this document.

These IRs apply to spatial resources (i.e. datasets, dataset series and services), and may be applicable to other resource types. The Metadata IRs are applicable to the functional concepts of discovery, evaluation and use. They define the minimum requirements and give a long term vision.

The metadata for discovery include a minimum common denominator and the cross-walks between this minimum common denominator and the metadata sets in use by different communities.

The Metadata IRs are based on the following principles: they are in conformance with European and international standards, current practices in stakeholder communities and relevant European eGovernment initiatives like the European Interoperability Framework for pan-European eGovernment services (<http://europa.eu.int/idabc/en/document/2319/5644> ). In formulating the IRs, due regard is given to protecting existing investments and to minimizing costs.

This document defines the necessary conditions for maintaining and updating metadata on an abstract level. Logical units are defined for coherent implementation of necessary elements for metadata management (see section 4.6). The Metadata IRs describe actions and material which are the basis needed to provide the requested metadata and to guarantee the consistent use over various physical implementations. An abstract test suite for conformance to the IRs is described in Annex J. The transfer to local conditions needed for implementation is the responsibility of the relevant authorities and is not in the scope of the Metadata IRs. So this document does **not**:

- a. prescribe to custodians of metadata how to manage metadata for spatial resources
- b. prescribe encoding for metadata
- c. define machine-readable metadata for services
- d. define any responsible organisation for maintaining and updating of guidelines, code lists or other material.

## 2 Normative references

These Implementation Rules (IRs) incorporate by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to these IRs only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies (including amendments).

## 3 Terms and definitions

### 3.1.1 catalogue

A complete list of items arranged in alphabetical or other systematic order [Compact OED]

Note 1: A catalogue is not significantly different from a register.

### 3.1.2 coverage

Feature that acts as a function to return values from its range for any direct position within its spatial, temporal or spatio-temporal domain [ISO19123]

Example: Examples include a raster image, polygon overlay or a digital elevation.

Note: a coverage is a feature that has multiple values for each attribute type, where each direct position within the geometric representation of the feature has a single value for each attribute type.

### 3.1.3 data

Reinterpretable representation of information in a formalised manner suitable for communication, interpretation, or processing (ISO/IEC 2382-1).

Note: Data can be any form of information whether on paper or in electronic form. Data may refer to any electronic file no matter what the format: e.g. a database or binary data, text, images. Everything read and written by a computer can be considered data except for instructions in a program that are executed (software).

### 3.1.4 datasets

Identifiable collection of data (ISO 19101).

Note: A dataset may be a smaller grouping of data which, though limited by some constraint such as spatial extent or feature type, is located physically within a larger dataset. Theoretically, a dataset may be as small as a single feature or feature attribute contained within a larger dataset. A hardcopy map or chart may be considered a dataset.

### 3.1.5 dataset series

Collection of datasets sharing the same product specification (ISO 19115).

### 3.1.6 e-Government

Application of information and communication technology to enhance the effectiveness of a legislature, judiciary or administration, either to improve efficiency or to change the relationship between citizen and government, or both. [6]

### 3.1.7 feature

Abstraction of real world phenomena. A feature may occur as a type or an instance. [ISO19101]

### 3.1.8 feature attribute

Characteristic of a feature [ISO19101]

Example 1: A feature attribute named "colour" may have an attribute value "green" which belongs to the data type "text".

Example 2: A feature attribute named "length" may have an attribute value "82.4" which belongs to the data type "real".

Note 1: "attribute" has many different meanings in different computer modelling contexts. In relational models; in XML; in UML and in network modelling attribute is interpreted in very specific and different ways. Even with feature attributes, the distinction between feature subtypes and feature attributes can be slight.

### **3.1.9 gazetteer service**

Functionality that provides a controlled vocabulary of place names and references the associated geographic locations as points, bounding boxes, or polygons, expressed as spatial coordinates.

### **3.1.10 geographic identifier**

Spatial reference in the form of a label or code that identifies a location (ISO 19112).

Example: 'Spain' is an example of a country name, 'SW1P 3AD' is an example of a postcode.

### **3.1.11 geometric primitive**

Geometric object representing a single, connected, homogeneous element of space (ISO 19107).

### **3.1.12 lineage**

History of a dataset, and the life cycle from collection and acquisition through compilation and derivation to its current form [from ISO19101]

### **3.1.13 metadata**

Information describing spatial resources, making it possible to discover, inventory and use them<sup>3</sup>.

### **3.1.14 metadata element**

Discrete unit of metadata (ISO 19115). Metadata elements are unique within a metadata entity.

### **3.1.15 metadata entity**

Set of metadata elements describing the same aspect of data (ISO 19115)

### **3.1.16 metadata for discovery**

The minimum amount of information that needs to be provided to convey to the inquirer the nature and content of the data resources.

Note: The above definition falls into broad categories which answer the "what, why, when, who, where and how" questions about spatial resources .

### **3.1.17 metadata for evaluation<sup>4</sup>**

The amount of information sufficient to enable an inquirer to ascertain that a spatial resource fit for a given purpose exists, to evaluate its properties, and to reference some point of contact for more information (adapted from GSDI Cookbook).

Note: metadata include those properties required to allow the prospective end user to know whether the spatial resource will meet the general requirements for a given purpose.

<sup>3</sup> This definition of metadata originates from the directive. It is compatible with the general definition of metadata provided in ISO 19115 and the OGC abstract specification for metadata: "data about data". It clarifies the expected role of metadata within the INSPIRE Infrastructure

<sup>4</sup> In the directive the term inventory is used. However, in the geographic information community the term evaluation is used for the concept described by inventory. An authoritative description of the concept can be found in the GSDI Cookbook. Moreover, the Directive refers to evaluation in its Preamble, Para (6).

### **3.1.18 metadata for use**

Information required to access, transfer, load, interpret, and apply a spatial resource in the end application where it is exploited (adapted from GSDI Cookbook).

Note: This class of metadata often includes the details of a data dictionary, the data organisation or schema, projection and geometric characteristics, and other parameters that are useful to human and machine in the proper use of spatial resources.

### **3.1.19 portrayal**

Presentation of information to humans (ISO 19117).

### **3.1.20 product specification**

Detailed description of a spatial resource of type dataset or dataset series together with additional information that will enable it to be created, supplied to and used by another party (adapted ISO 19131).

### **3.1.21 profile**

Set of one or more base standards or subsets of base standards, and, where applicable, the identification of chosen clauses, classes, options and parameters of those base standards, that are necessary for accomplishing a particular function (ISO 19106).

### **3.1.22 quality**

Totality of characteristics of a product that bear on its ability to satisfy stated and implied needs [ISO 19101].

The degree of excellence of something as measured against other similar things [Compact OED]

### **3.1.23 register**

Set of files containing identifiers assigned to items with descriptions of the associated items (ISO 19135).

### **3.1.24 registry**

Information system on which a register is maintained (ISO 19135).

### **3.1.25 resource**

Asset or means that fulfils a requirement.

Example: dataset, service, document, person or organization.

### **3.1.26 service**

Distinct part of the functionality that is provided by an entity through interfaces (ISO 19119).

In computing terms, a service is an application that provides information and/or functionality to other applications. Services are typically non-human-interactive applications that run on servers and interact with applications via an interface (from Microsoft)

Note 1: This distinct part of the functionality is a computation performed on one side of an interface in response to a request made on the other side of the interface.

Note 2: Services can provide things like WMS (a picture of a map), WFS (GML) and WCS (an image). Then there are services where a user supplies a coordinate and the service transforms it to another coordinate, or a user supplies an image and the service transforms or

performs image processing. These are all something that can be read and written by the computer and are in accord with the note in data.

Note 3: Some services may be off-line, where data may be on off-line media.

### 3.1.27 spatial data

Any data with a direct or indirect reference to a specific location or geographic area.

### 3.1.28 spatial resource

Asset or means that fulfils a requirement and has a direct or indirect reference to a specific location or geographic area.

Example: dataset, dataset series, service.

### 3.1.29 validity

Validity may be related to the range of space and time that is pertinent to the data; to whether the data has been checked to a measurement or performance standard or to what extent the data is fit for purpose.

## 4 Vision on Metadata

### 4.1 Metadata in few words

**ISO 19115** defines metadata as “data about data”. This basic definition implies an unlimited scope to what can be seen as metadata. It allows some experts to see information as data or metadata with an unrealistic border between both<sup>5</sup>. The INSPIRE Directive clarifies the definition of metadata as information describing spatial resources, making it possible to discover, inventory, and use them. These Implementing Rules detail the definition of metadata and its expected role within in the INSPIRE Infrastructure.

These Implementing Rules are applicable to spatial- and, to a certain extent, non-spatial resources (as described in section 4.4). The metadata for those resources comprise:

- **Identification information**, i.e. information to uniquely identify the resource such as:
  - Title, abstract, reference dates, version, purpose, responsible parties, ...
  - Data extent,
  - Browse graphics (overview, thumbnail, ...),
  - Possible usage;
- **Legal and security constraints**;
- **Content Description**, i.e. information identifying the feature catalogue(s) used and/or information about the coverage content;
- **Reference system information**, i.e. identification of the spatial and temporal system(s) used in the resource data;
- **Spatial Representation**, i.e. information concerning the mechanisms used to represent spatially the resource data;
- **Quality and validity information**<sup>6</sup>, i.e. a general assessment of the quality of the resource data including:
  - quality measures related to the geometric, temporal and semantic accuracy, the completeness or the logical consistency of the data;
  - lineage information including the description of the sources and processes applied to the sources;

---

<sup>5</sup> Some metadata, such as the results of quality evaluation may comprise real data and possibly spatial data, for example when the result of the evaluation is expressed as a spatial coverage.

<sup>6</sup> The DT Metadata has taken quality for services in consideration although it is not mentioned in the Directive. For the following reasons it is not part of the implementing rules.

Services, including web services, are routinely measured in terms of availability and performance. These parameters are easily quantified and users can easily agree on their value: services that are available more often (seeking the elusive 99.9% "up-time") are more desirable than services that are available less often, and services that provide faster response time are more desirable than similar services that are slower to respond.

Similar to the case of testing the top speed of a CPU or a car, web services tests must be highly controlled. A car will not have the same top speed when overloaded, running uphill, against the wind, or in snow. In the same sense a given web service is normally affected by a wide range of external forces: network latency, software configurations, protocols used, etc. that need to be held constant and controlled. Given all the possible external influences it is not advisable to state that a certain web service is fast, or has high availability in general: the whole configuration needs to be tested in each unique situation.

Despite those warnings, availability and performance parameters are quite objective, however the notion of quality quickly becomes subjective in nature, when we define quality as "fitness for use". The answer to the question "Is this service useful?" will often elicit the response, "It depends; useful for what purpose, and for which user?".

Attempts to objectively rate (and publish in metadata) the "usefulness" of a service, such as that it produces correct responses or behaviours, will almost certainly create problems among service vendors, and would likely do more harm than good to consumers. Most other markets rely on informal user feedback as the ultimate test as to whether or not a product or service is useful, a good value, etc. This feedback appears spontaneously in news and mail forums, in the popular press, and by word-of-mouth.

Service metadata should probably focus on objective aspects, and not attempt to document fitness for use.

- validity information related to the range of space and time pertinent to the data; to whether the data has been checked to a measurement or performance standard or to what extent the data is fit for purpose.
- **Portrayal information**, i.e. information identifying the portrayal catalogue used;
- **Distribution information**, i.e. information about the distributor of, and options for obtaining the resource;
- **Maintenance information**, i.e. information about the scope and frequency of updating of the resource data.

A general use case described in section 4.6 defines the three major activities involving metadata: discovery, evaluation and use. A prerequisite is effectively the establishment and maintenance of metadata, i.e. the overall management of the metadata resources. The IRs do not regulate the way the metadata resources have to be managed, but the metadata resources concerned by the Directive have to be inventoried and the corresponding metadata have to be managed for the satisfaction of the users through the three main activities involving metadata.

## **4.2 Why create metadata?**

Any organisation providing information should provide some way that a non-specialised user can discover, evaluate and use that information. This may be done by providing buttons, menus, or navigational structures on a web site or by providing free-text search capabilities.

However, simply searching for words or phrases in the contents resources is a hit-or-miss strategy. When the spatial resource of interest has some word or phrase uniquely associated with it, this can be quite successful; but in other cases, hundreds or thousands of irrelevant "hits" may be returned, as anyone can confirm who has spent frustrating hours searching for something whose name is a common word.

An alternative is to use metadata to describe resources in terms of certain well-defined attributes, such as resource title, geographic extent of the resource, resource topic category, or keywords. This allows users to search for keywords, names and phrases in particular contexts or structured search. For example, an organisation's name might be defined as a responsible party or as the distributor of a spatial dataset, in contrast to having no such information or being one of the many organisations that are described in a document linked to the spatial dataset. If this capability is combined with the use of "controlled vocabularies" (i.e. standardised lists of terms, such as abbreviations for countries or code lists for categories) and standardised formats for values such as dates or longitude/latitude, it can greatly improve the efficiency of discovery.

For example, if all spatial resources are assigned metadata such as a resource topic category, it becomes much easier for a user to find resources that match a query for a specific topic.

From the perspective of a government organisation, it is important to help users obtain accurate and appropriate information: if users suffer some kind of loss as a result of finding incorrect or inappropriate information, they will make wrong decisions. In order to improve the discovery, evaluation and use of government information throughout the EU Member States, the metadata created to describe resources at different websites and by different organizations must share a common form and meaning, so that users do not have to learn a different set of terms and search strategies for each site they visit. Such "interoperability" is especially important for users who need to combine or compare information from multiple resources, but it is useful for any user attempting to discover information provided by government.

## **4.3 A standards based approach**

The Metadata IRs have been defined at an abstract level, but the approach is based on existing standards. Many factors encourage the adoption of a standards based approach.

Very detailed information on this topic is provided in the GSDI Cookbook, but the following information is more particularly applicable to the INSPIRE context:

1. **The importance of using a dedicated metadata standard to support the implementation of a Global Spatial Data Infrastructure** has been demonstrated by the different initiatives conducted since the early 90's particularly in:
  - North America with the development of the Content Standard for Geospatial Metadata by the US Federal Geographic Data Committee (FGDC) and the Presidential Executive order that all Federal government agencies were required to produce metadata for their spatial data holdings,
  - Europe with the experimentation of ENV 12657 [5] and more recently with the emergence of national and sub-national Spatial Data Infrastructures and their increasing adoption of **ISO 19115**.
2. More than the lack of metadata, the lack of compatibility between the existing and upcoming metadata solutions is certainly one of the greatest challenges of the INSPIRE Directive. At this stage and due to the importance of the community, the use of a standard lexicon is a key to success.
3. **The standardisation activity in this area has reached level of maturity.** A metadata standard dedicated to Geographic Information is available with the publication of **ISO 19115**. Its applicability to the European context was established with its adoption by CEN in 2005. The reference materials provided by the INSPIRE community for the establishment of these IRs show a general endorsement of this international standard by the different European actors of the geographic information domain. Most of the Legally Mandated Organisations and SDIC have already adopted **ISO 19115** or have on-going activities to adopt it as indicated by the results of the INSPIRE survey conducted in Spring 2006.<sup>7</sup>

The importance of standards is also stressed within the preamble of the INSPIRE Directive:

*In order to benefit from the state of the art and actual experience of information infrastructures, it is appropriate that the measures necessary for the implementation of this Directive should be supported by international standards and standards adopted by European standardisation bodies in accordance with the procedure laid down in Directive 98/34/EC of the European Parliament and of the Council of 22 June 1998 laying down a procedure for the provision of information in the field of technical standards and regulations and of rules on Information Society services. (Paragraph 28)*

Taking the above into account, the fact that the majority of the visited metadata reference material is standards-based, and the global dimension to which INSPIRE is linked (cf. INSPIRE, Preamble, Paragraph 10), the Metadata Drafting Team has decided to follow as much as possible a standards-based approach. The current or future adoption of relevant standards among the INSPIRE SDICs and LMOs illustrates the level of maturity and endorsement that in particular EN ISO 19115 has reached in the domain of geographic information.

A standard based approach is certainly the best answer to the High Level Requirements of INSPIRE as it ensures the conformance to the European and International Standards, as well as the current practices in stakeholder communities which already use or consider the use of the emerging metadata standards.

The applicability of the available standards is discussed in details in Annex D. The reference metadata standard for spatial resources is based on a set of foundation standards from the ISO 19100 series, e.g. **ISO/TS 19103**, **ISO 19107** and **ISO 19108**. **ISO 19119** extends **ISO 19115** for spatial services. The applicable XML Schema Implementation of **ISO 19115** is defined in **ISO/TS 19139** which expresses encoding rules applicable to **ISO 19119**.

Those standards satisfy fully the requirements for discovery and evaluation of spatial resources, but in term of use<sup>8</sup>, complementary standards from the ISO 19100 series have to be considered, e.g. **ISO 19110**, **ISO 19111**, **ISO 19117** and others.

<sup>7</sup> See [http://www.ec-gis.org/inspire/reports/INSPIRE\\_Metadata\\_Survey\\_2006\\_final.pdf](http://www.ec-gis.org/inspire/reports/INSPIRE_Metadata_Survey_2006_final.pdf)

<sup>8</sup> It is recognised that metadata for use may be found most often in practice in formal documentation of individual applications or of data handlers, which may not easily be extended to on-line or web applications.

Access to on-line metadata repository is fostered by standard interface specifications, such as the OGC **CSW 2.0** which can accommodate the use of different abstract metadata standards and related encoding, such as:

- **ISO 19115** and **ISO 19119** through their **ISO/TS 19139** XML Schema implementation (**CSW2 AP ISO**);
- Dublin Core and its XML Implementation which are relevant to ensure the relationship with other communities.

## 4.4 Type of resources

The INSPIRE Directive requires Member States to create and to keep up-to-date metadata for spatial resources, i.e. assets or means related to the earth either by terrestrial coordinates or by geographic identifiers attached to terrestrial coordinates. This version of the IRs does not deal with metadata at the data level (feature, attribute, etc.), but with metadata related to identifiable collections of spatial datasets and to services that may be used to process them.

The wide scope of the term “spatial dataset” requires some consideration about dataset granularity (see section 6.3). For this purpose, this version of the IRs also introduce requirements related to “dataset series”, i.e. collection of datasets sharing the same product specification.

These IRs can be applied to resources for which they are not mandated. Typically, non spatial datasets may be involved in the management and use of spatial information. Management of non geographic datasets in the context of the INSPIRE directive may be necessary, but in this case, relaxed constraints will be expressed on their metadata.

## 4.5 The INSPIRE Communities

### 4.5.1 Thematic scope

The thematic scope of the INSPIRE Directive is defined by its Annexes I, II, and III. These annexes consists of more detailed classification of themes than the one published by **ISO 19115**. For consistency, the INSPIRE themes are mapped to the **ISO 19115** topic categories in Annex E.

### 4.5.2 Parties

The INSPIRE community is the aggregation of a set of thematic communities composed of wide range of parties, including:

- **Resource provider**, i.e. a party supplying the resource;
- **Custodian**, i.e. a party that accepts accountability and responsibility for the resources and ensures appropriate care and maintenance of the resource;
- **Owner**, i.e. a party that owns the resource;
- **User**, i.e. a party who uses the resource;
- **Distributor**, i.e. a party who distributes the resource;
- **Originator**, i.e. a party who created the resource;
- **Point Of Contact**, i.e. a party who can be contacted for acquiring knowledge about or acquisition of the resource;
- **Principal investigator**, i.e. a key party responsible for gathering information and conducting research;
- **Processor**, i.e. a party who has processed the data in a manner such that the resource has been modified;
- **Publisher**, i.e. party who published the resource;
- **Author**, i.e. party who authored the resource.

These responsible parties are identical with the content of a code list (CI\_RoleCode) in **ISO 19115**. All those parties, including the users, may influence the content of the metadata and may consequently appear as such in the metadata.

### 4.5.3 Link with other communities

The INSPIRE community is composed of all the parties involved in the management and use of European spatial resources. However, the users may not be involved directly in the activity related to one of the themes identified in section 4.5.1.

These IRs are defined in order to ensure their conformance to the relevant European initiatives such as e-Government, and the EU interoperability framework. In particular, the Directives on the re-use of public sector information (2003/98/EC) and that on public access to environmental information (2003/4/EC) are of first interest because:

- most data is collected and managed by public sector organisations;
- a spatial public resource is an information resource which has to be inventoried, catalogued and made searchable online;
- the cost and effort involved in the inventory, cataloguing and the development of search capabilities is high. It must be done consistently and well, avoiding the duplication of efforts.

Of course, any organisation having a stake in one of the INSPIRE themes is concerned by these IRs as a user, independently of the specific role it may play in the management of the resources addressed by the INSPIRE Directive. There is consequently a wide range of potential users of these resources, including some users not specifically interested in spatial data. These IRs accommodate the need to have metadata for spatial resources available and the need for searching spatial resources and browsing their metadata using general search engines and metadata browsers.

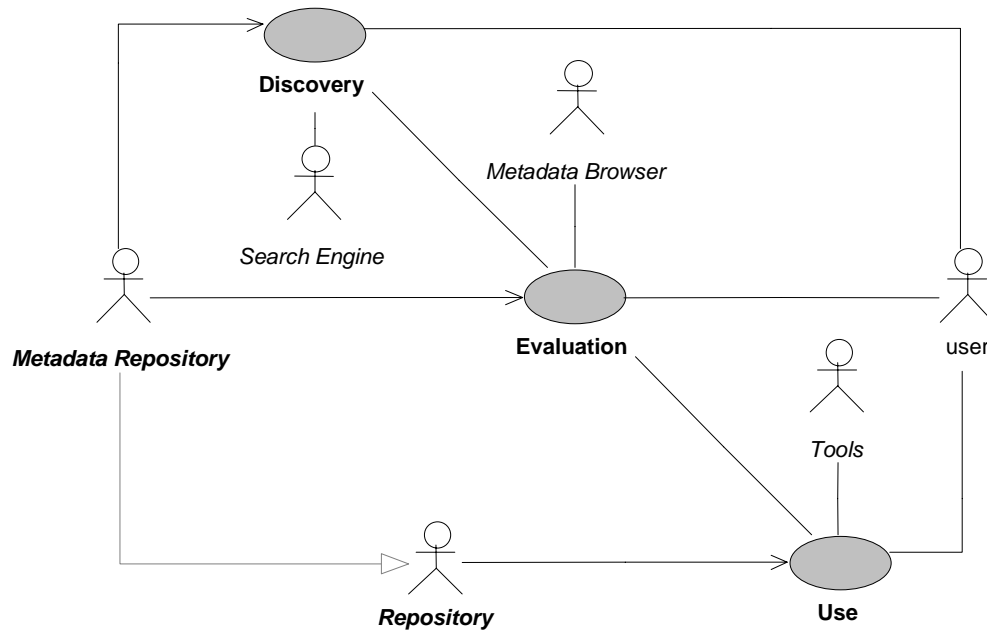

An initial set, level 1 (see section 5.3.2), of discovery metadata fulfils basic user requirements and is extended to a level 2 (see section 5.3.3) for richer metadata for spatial resources defined in a level 2 of discovery metadata and available for evaluation and use of the spatial resources. The simplicity of the level 1 of discovery metadata is associated with the applicability of general metadata standards such as Dublin Core.

## 4.6 The INSPIRE Metadata Use Case

The INSPIRE Metadata Use Case creates a general context federating the existing and upcoming metadata based solutions around three base user activities:

1. The **discovery** of resources. The user expects to identify a set of resources satisfying a basic set of search criteria. The user interacts with a Search Engine connected to a set of metadata repositories which document available resources. The Search Engine transfers the search criteria to the metadata repository and expects a minimum set of metadata related to the matching resources. It consolidates the answers and provides them to the user through an adapted interface.
2. The **evaluation** of available resources. The user has now identified a candidate resource, potentially as a result of the discovery activity and wants to determine whether this resource satisfies his/her requirements or not. For this purpose it may use a Metadata Browser to examine more detailed metadata about the resource.
3. The **use** of adequate resources. The user has chosen a resource and some access and use rights have been granted to him/her. The resource is accessible and can be used through a series of dedicated tools. Metadata will support the user in fully understanding the data and using it properly resulting in more reliable analysis and more confidence in the results.

These three base user activities are modelled in Figure 1. General IRs applicable independently of these three user activities are expressed in chapter 6. The IRs applicable to the discovery, evaluation and use activities are expressed in chapter 5, 6 and 8 respectively.

**Figure 1 - The INSPIRE Metadata Use Case**

Different kinds of users may be involved in the different activities: some experts may evaluate the resources while operators may use them. There are cases where the user may be a software program performing automating searches. Depending on the users, different types of Search Engines, Metadata Browsers and Tools may be necessary. From this perspective, this use case does not constraint the software market and it even creates a general context fostering the emergence of new markets and the satisfaction of new user requirements.

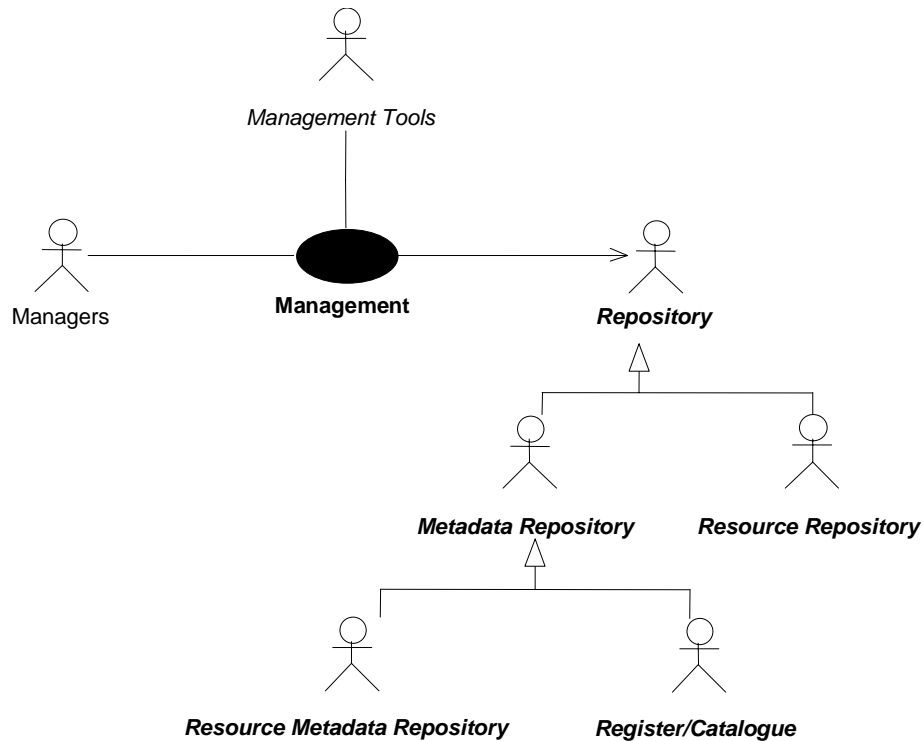

If the INSPIRE Directive implies that the discovery, evaluation and use activity be enabled online, these IRs, and particularly the use case presented herein is applicable also to the offline interchange of spatial data. The Search Engines, Metadata Browsers and Tools can be local applications acting on a simple transfer dataset stored on a medium (e.g., CD-ROM, DVD, and so on).

This use case is based on the existence of a set of repositories. Different types of repositories can be distinguished:

- The resource metadata repositories contain information about available resources. The content of a resource repository may be defined using external metadata repositories such as spatial item registers and catalogues.
- The registers and catalogues contain information related to spatial information items such as geodetic codes and parameters, units of measure or codelists. More complex spatial resources, such as feature or portrayal catalogues, may be involved as well.
- The resource repositories contain the available resources.
- 

The content of these repositories need to be accessible. This should happen preferably via a standard interface and/or standard encoding format such as XML.

As shown in Figure 2, the hidden side of the INSPIRE Metadata Use Case is the management of those repositories.

**Figure 2 – The hidden side of the INSPIRE Metadata Use Case**

The management activity is the responsibility of managers, i.e. a wide range of actors involved in the establishment and maintenance of the repositories using Management Tools. This management activity is out of the scope of these IRs. As a consequence, they will not express any constraint concerning the effective content of those repositories, but:

- some constraints will be expressed concerning the way this content can be accessed or interchanged;
- the INSPIRE Directive expresses a requirement to inventory the existing spatial resources available.

The INSPIRE Metadata Use Case is not specifically defined for spatial resources but the different software, interfaces, exchange formats and standards involved in the implementation of the use case activities may be specific depending on the users. The spatial resources are concerned as any other type of public information by the Directive on Public Sector Information (PSI). As defined, the INSPIRE Metadata Use Case meets the inventory, search and access requirements expressed in the PSI Directive whoever the user interested in the available spatial resources is.

## ***4.7 Use case for temporal search and discovery***

### **4.7.1 Requirements for temporal metadata**

The INSPIRE Directive says nothing about temporal metadata, either as a reference date or for temporal extent. The Directive does say that temporal information should be contained in the content for data specification, where it is important.

Geo-information is information about phenomena directly or indirectly related to the Earth. These phenomena occur in a spatial-temporal domain and aggregation of geo-information can occur in both the spatial and temporal dimensions.

The Directive also includes many themes which can have a temporal nature. In Annex III for Atmospheric conditions and Meteorological and Oceanographic geographic features these themes are fundamentally temporal and the features are mainly events, not locations. The temporal aspects can be more important than spatial. Horizontal spatial scales for these themes are seldom smaller than several kilometres, while time scales of hours (or even minutes and seconds) can be crucial.

At the other end of the time scale, Geology is also an INSPIRE Theme in Annex II where time sequence and temporal identification are fundamental.

Distinctive properties of temporal information are:

- Temporal knowledge may be relative, and either the relative times are more precisely known than absolute times or they cannot be described by a date (e.g. geological eras);
- Some temporal reference systems can have a moving reference time, (e.g. weather forecasts are relative to the issue time, and current weather is “now”);
- Temporal knowledge may be uncertain, that is, the exact relationship between two times may be not known precisely;
- Temporal information may be ordinal, where the periods are in sequence and are named (e.g. spring, summer, autumn, winter) and the transitions may not have specific dates;
- The granularity of temporal information may vary significantly (e.g. geological eras vs. the duration of a solar eclipse).

#### **4.7.2 Temporal searches**

A distinction must be made between temporal information within identification metadata (for search and discovery purposes) and temporal information within data content (for evaluation and use of the data).

It is easy to find overriding requirements in environmental data for temporal information. Many themes require temporal content for selection within a chosen data repository which is a requirement for evaluation and use. Temporal metadata are required for use in discovery when the query is essentially temporal, and less importantly, spatial.

There are two distinct discovery use cases for temporal extent: where the user query is specifically temporal; and where the data set repositories are distinguished by temporal classification or have temporal rather than spatial organisation.

#### **4.7.3 Temporal user queries**

Some general user queries might be:

- A travel company wishes to search for the January snow climatology for the Alps, for inclusion in a brochure. The full temporal coverage might be the summary statistics of snowfall and snow cover for the period 1971 to 2000 taken over all Januaries. Here the discovery metadata is specific for area and for temporal extent. The classification of temporal extent is an ordinal reference system of named months.
- A hydrologist is looking for winter rainfall climatology in a catchment area. Here the ordinal classification of winter may be more important than a specific geographical position, as the hydrologist will expect to generalize to the catchment from whichever specific locations are found.
- A geologist may wish to find surface beds of Tertiary minerals across Western Europe. Again the ordinal temporal classification is initially more important than location.

- A marine investigator requires weather information for a specific period for an accident at sea, the location being only approximately known.
- An archaeologist wishes to compare sites across a region which are known to be active in the same time period. The discovery is to find locations for a known period.
- Anyone who wants a weather forecast for 3 days hence. For a weather forecast, the sequence of weather is usually more important and may be more accurately forecast than the expected weather at a specific location and time.

#### 4.7.4 Distinguishing repositories by temporal metadata

Repositories may be organised by temporal rather than geographic stratification:

- It is notable that the INSPIRE themes mentioned above can all have enormous amounts of data extending into the petabyte range. If in the data repository, the data are identified and stored with a temporal organisation, there will be considerable service efficiencies if the search mechanisms reflect this.
- Even more important is that many temporally organised repositories may hold data for a wide or global geographic extent, but only a restricted temporal extent.

A dataset series may describe a range of specifications. In the life cycle of data, particularly for temporal data, the data may have different use cases at different stages, and the data held and the granularity of the metadata to describe it and the repository itself, may change across the life cycle of data as well as the processing sequence.

In meteorological data, data are gathered by the hour and minute, exchanged around the world, and used in weather forecasting immediately. They are stored primarily by time, and only secondly by spatial position. As the data age, they are moved to intermediate caches, and are used for forensic purposes, what actually happened, how accurate were the forecasts etc. As this requirement passes, they are moved to climate datasets, where they are also held as time sequences. The data are normally processed across time classified by month or season, and time averages or extremes tend to be made.

The temporal extent metadata will be different and will change character at different stages too. As the data are collected, temporal metadata might be “today” or forecasts for “the next 3 days”. As it transfers to cache it might be for “the last month”.

In the archive it will be classified by date and time, but in the climatological summary repository, it will be described by an ordinal temporal reference system, such as “winter” rainfall summaries. These ordinal time periods may refer to times within a general or average year, but not to a specific year.

Throughout this process sequence, data will be retained or discarded according to the requirements of the repository.

Temporal weather related searches might be: for past climate summaries; for specific past or recent weather; for current weather; for short range forecasts for the next hour or day; for medium term forecasts for the next week; for extended range forecasts for the next month or season; or (at the extreme range) for climate change estimates for the next century.

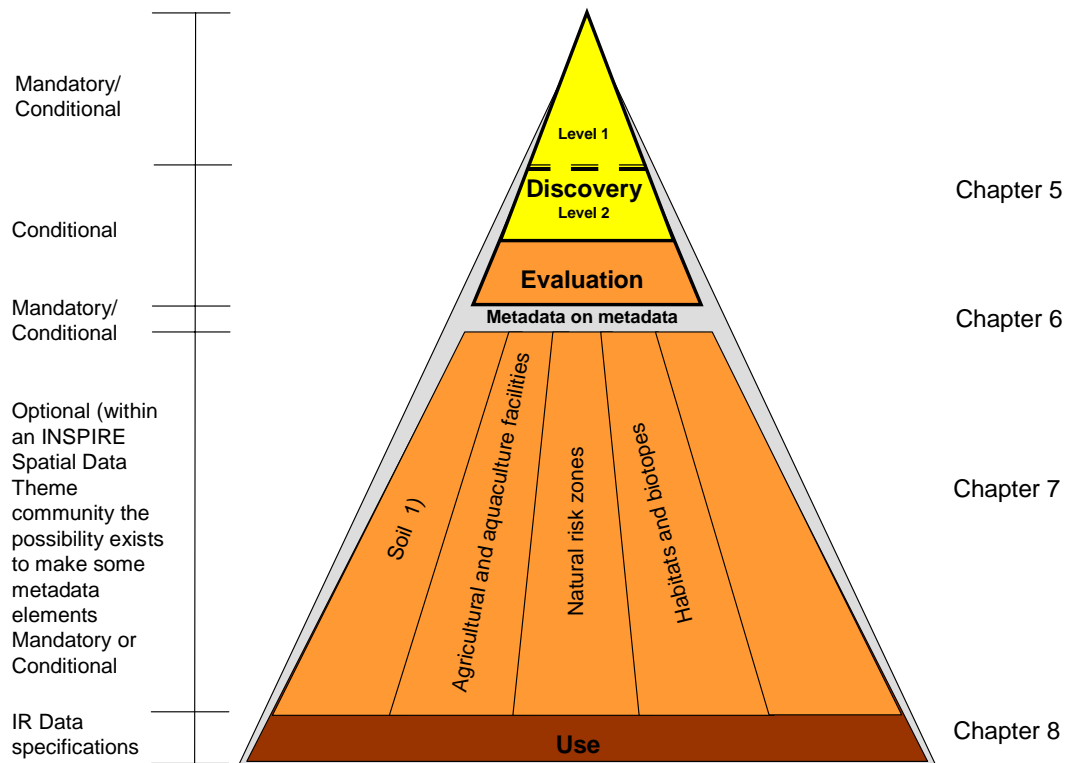

All of these classes of searches are likely to be directed to different reference systems in different repositories. Indeed, few organisations will be able to handle queries for all these classes, and the reference systems will be held across different organisations. On the other hand, spatial queries (even full globe searches) are likely to be possible in any specific reference system holding a specific temporal class.

## 4.8 The INSPIRE Metadata

Different levels of requirements are expressed in the following chapters concerning the availability of metadata elements related to spatial resources:

- Metadata on metadata is needed to know what the status is of the metadata itself. It is described in the General IRs defined in chapter 6;
- Discovery metadata is composed of two levels. Level 1 discovery metadata ensures the needed linked between the expert and the non expert users. Level 2 discovery metadata are detailed enough for high level discovery of spatial resources by expert users.
- Evaluation metadata includes level 2 metadata and a set of metadata elements needed to evaluate the fitness for use of the spatial resource. The INSPIRE evaluation metadata elements is a minimum set to be extended by the different INSPIRE user communities to adapt the evaluation metadata to the resource specificity. The evaluation metadata is supported by ISO 19115 and ISO 19119, and possible user community extension of ISO 19115 and ISO 19119.
- Use metadata involves complementary standards such as **ISO 19110**, **ISO 19111**, **ISO 19117** and others. In practice use metadata may often be found in documentation for applications rather than associated with data.

The interrelations between the different level metadata needed to cover the INSPIRE Implementing Rules and the user communities metadata is illustrated in Figure 3.

<sup>1)</sup> The mentioned INSPIRE Spatial Data Themes are pointed out as examples to give an impression

**Figure 3 – The INSPIRE Metadata**

## 5 Implementing Rules for Discovery

### 5.1 Introduction

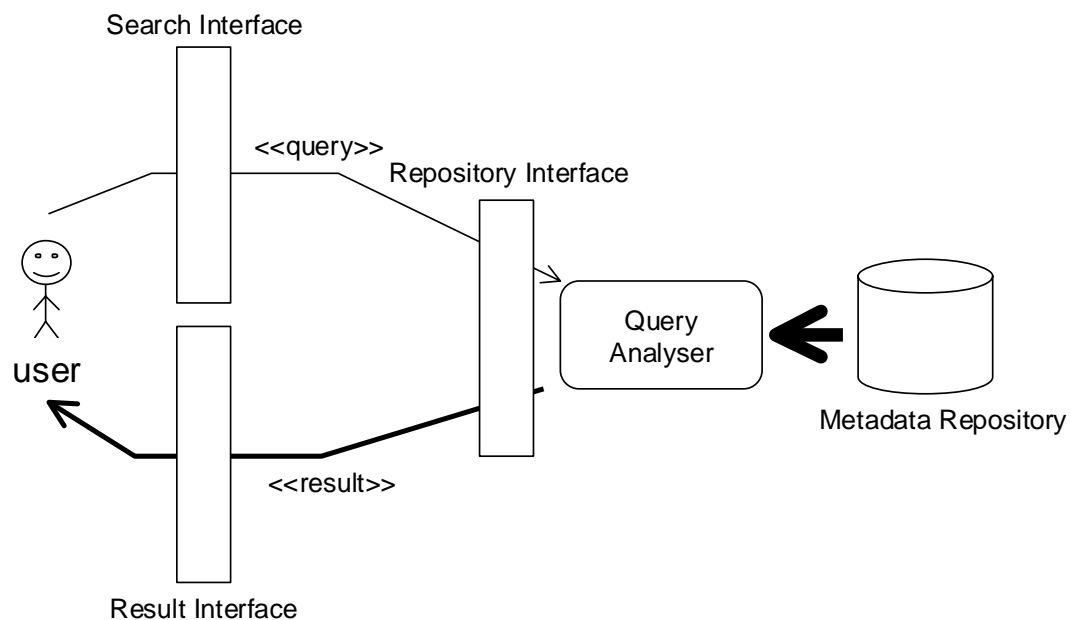

Metadata for discovery serve the following purposes:

- to provide information about the resources a user is interested in
- to enable organisations to publish their data holdings

The discovery activity involves an interaction between a client application (e.g., a search engine) and a metadata repository. In this interaction, it is fundamental to consider:

- the user **query** expressed through the **search interface** of the search engine and provided in a form compatible with the metadata repository interface;
- the **query analyser** which evaluates each of the metadata sets of the **metadata repository** against the query criteria;
- the **resulting metadata sets** (i.e., the metadata sets matching the query criteria expressed by the user) as they are provided first by the **repository interface** to the **result interface**, then by the result interface to the user.

This interaction shown in Figure 4 is not specific to a distributed search over a network: it can be handled by a local Search Engine acting on a local Metadata Repository possibly as simple as a single metadata file.

**Figure 4 – Interaction between Search and Response**

The manager of the metadata repository is fully responsible for the repository content model which will not be discussed further. In the same way, the search engine providers are responsible for defining the user-side of the search interface and of the result interface. Consequently, these IRs focus on:

- the content of the queries provided by the Search Interface to the Repository Interface;
- the core content of the resulting metadata sets provided by the Repository Interface to the Result Interface.

From this perspective, the metadata elements involved in the discovery of spatial resources can play two roles: metadata elements that constitute search-parameters and metadata elements whose main role is to describe a resource in response to a query.

This IR therefore distinguishes between two categories of metadata:

- Search metadata – Search metadata allow a user to formulate a query. They help specify what kind of data the user is looking for (e.g., which part of the world this data covers, and when the data was created). Search metadata will be a small set of metadata elements, which shall be supported by every metadata query tool and every metadata catalogue.
- Response metadata – Response metadata constitute a documentary feedback from the data/service provider, more fully describing a resource. Response metadata can be used for evaluation and to answer questions like:
  - What data and/or service are available within an area of interest?
  - Who is responsible for the resource and the associated metadata?
  - Who can I contact to get access, use and pricing of the resource?
  - Does the identified resource contain sufficient information to enable a sensible analysis to be made for my purposes?
  - What is the quality of the identified resource?
  - How and where can I obtain the resource?

Response metadata are documentation provided with a resource to ensure that users other than the data providers themselves use a resource correctly and wisely. They may also contain evaluation metadata that specify the necessary processes to obtain and use the data. Response metadata help end users as well as data providers to document, store, reuse, maintain and archive a resource effectively.

The discovery metadata elements are defined at an abstract level in order to make the Implementing Rules independent of:

- the specific encoding used to express the query or resulting metadata sets;
- possible future changes in standards such as ISO 19115 / ISO 19119, Dublin Core or others.

The full list of INSPIRE discovery metadata elements is provided in section 5.2.

This abstract metadata set for discovery distinguishes two levels of conformance for the response metadata elements:

- **Discovery level 1** elements are metadata that provide basic and essential descriptions of a resource.
- **Discovery level 2** elements are metadata that describe a resource in more detail. Level 2 elements are not essential for the first response. They give additional information about a resource as specified in Article 5 and 11 of the INSPIRE directive or are essential for an evaluation of the metadata information itself.

To a certain extent, the first level satisfies a low level of discovery while the second level satisfies more complex discoveries and a minimum evaluation of the resources. Both are complementary. The first level is appropriate to e-government bodies. The second level is more appropriate for users who have enough knowledge to use the search metadata consistently or for a first evaluation of the resource.

A Search Engine or a query analyser has to comply with one of the discovery levels. Compliance to discovery level 2 also requires compliance to discovery level 1. These IRs only define a core set of metadata elements for discovery. Compliance must still allow more metadata elements to be supported than the minimum defined in these Implementing Rules.

Any INSPIRE compliant Search Engine shall enable the expression of queries including search criteria related to any of the INSPIRE Search Metadata Elements of the targeted discovery level compliance. Any INSPIRE compliant query analyser shall be able to handle the query criteria related to the INSPIRE Search Metadata elements of the targeted discovery level compliance. When a Search Metadata element is not relevant for a resource or not part of the targeted discovery level compliance, the related search criteria are ignored. The complexity of the queries depends on the chosen encoding.

In term of result, the discovery metadata elements are mandatory (they have to be provided) or conditional (a condition defines when the metadata element has to be provided in a resulting metadata set). These IRs define whether the response metadata elements may occur once or more in a given set. A Search Engine should enable an access to all the metadata related to the INSPIRE Metadata elements of the targeted compliance level.

## **5.2 Discovery metadata elements**

### **5.2.1 Resource title**

This is a characteristic and often-unique name by which the resource is known. Because the name may contain basic information about a resource such as a geographic and/or thematic description of the resource, it is an important element for the identification of resources (by human users).

### **5.2.2 Temporal reference**

The temporal reference of a resource will vary depending on the resource. It should be included in the discovery metadata if it is an important element describing the resource, particularly if the resource is not properly identifiable without this information.

There are a number of situations where temporal reference is important, and it may describe the following:

- The time period covered by the content of the resource (also called the temporal extent of the resource)
- The date of publication of the resource when available
- The date of last revision of the resource if the resource has been revised
- The date of creation of the resource if it has not been revised

When temporal reference describes the time period covered by the content of the resource, it should be a primary descriptor identifying the resource and not just information relevant to the use of the data. Spatio-temporal data are located in a defined space and at a defined time interval (a time instant can be considered as an infinitesimal interval), and their temporal extent can be of primary importance.

Particularly for time varying data, it is necessary to support searches by filtering resource content location in space and time. This is in contrast to other types of resources (e.g., publications), where the date of publication of the resource is typically used as search parameter.

A location in the time domain is a temporal position measured relative to a temporal reference system. A common type of temporal reference system is a calendar (used with clocks for greater resolution).

A calendar is a discrete temporal reference system that provides a basis for defining temporal position to a resolution of one day. A clock provides a basis for defining temporal position within a day. A clock must be used with a calendar in order to provide a complete description of a temporal position within a specific day.

There is some temporal information which cannot be described by specific dates or periods. Temporal information may be known more accurately by relative position than by absolute time, and in such cases an ordinal temporal reference system would be used. Examples are geological eras (such as Jurassic, Triassic or Cretaceous) or climatological eras (spring, summer, autumn, winter). Names in an ordinal temporal reference system can be considered as equivalent to names in a gazetteer.

Other temporal references are indeterminate, in that generally they cannot be pre-defined in metadata, but in use they are specific. A data set which contains only today's data or data for the last 24 hours or forecasts for the next week (e.g. weather data) cannot have the dates exactly defined in metadata, but in use the dates and times can be defined precisely.<sup>9</sup>

### 5.2.3 Geographic extent of the resource

This is the location and extent of a resource in geographic space, given as a bounding box with four coordinates or as a geographic identifier.

Because spatial data describe real-world phenomena for specific areas on the surface of the earth, the location and geographic extent of a resource is of primary importance and is used in spatial search requests. Depending on the type of the search interface, either a bounding box or a geographic identifier can be used to resolve such requests. Place name lists or gazetteers provide a controlled vocabulary for place names, including a reference to the respective geographic location expressed in spatial coordinates. Gazetteer services may therefore be used to disambiguate geographic identifiers and link them to their spatial footprints, typically expressed as point coordinates, bounding boxes, or polygons.

### 5.2.4 Resource language

The language(s) used within the resource using the standard language codes in ISO 639-2 often used by search engines for narrowing the search. This element is particularly important for searches in a multi-lingual environment.

### 5.2.5 Resource topic category

The topic category is a high-level classification scheme to assist in the grouping and the topic-based search of available spatial resources. The applicable topic categories are defined in section 4.5.1. The specified topic category positions the resource within the framework of the INSPIRE themes given in Annexes I, II and III.

### 5.2.6 Keyword

Commonly used word(s), formalized word(s) or phrase(s) used to describe the subject. While the topic category is too coarse for detailed queries, keywords help narrowing a full text search and they allow for structured keyword search. An ideal situation is to base this on an existing thesaurus or taxonomies. A keyword search represents a minimum search criteria defined by INSPIRE in Article 11-2 (a).

### 5.2.7 Service type

If the resource itself is a service, this refers to an interface specification that the service implements. Well known service types published as standard are of course recommended (e.g. an OGC WMS).

### 5.2.8 Resource responsible party

---

<sup>9</sup> The mechanisms in metadata searches for ordinal or indeterminate temporal references are not well defined. A pilot project for INSPIRE is in planning to investigate the best way to describe, code and use this type of temporal information.

The public authority or any other citation to the organisation most responsible for the resource and the corresponding role(s) (the establishment, management, maintenance and distribution of spatial datasets and spatial data services organisation (INSPIRE Article 5-2 (d) and 11-2 (g)).

This element is also important for full text search. Depending on the applicable encoding and metadata standard, this element may be expressed as a text or as a structured set of information. In this last case, the full text search is applied to the individual textual components of the structured set.

### 5.2.9 Abstract

This is a brief narrative summary of the content of the resource.

### 5.2.10 Resource locator

The resource locator defines the location of the resource. It is used in order to access the resource or at least more information about the resource. It is commonly expressed as a Uniform Resource Locator (URL), particularly for an online linkage.

### 5.2.11 Constraint

This metadata element defines a set of restrictions placed on a resource. It may be not exclusively a security or legal constraint. The basic form of such a constraint is a use limitation statement, which can be used for full text searches. For legal constraints, different types of restrictions can also be expressed in term of access to and use of the resource. For security constraints, a level of classification and related information can also be provided.

Considering the importance of the legal constraints in term of protection of privacy or intellectual property, the absence of constraints on a resource would be unexpected. It is highly recommended to avoid the absence of constraints and to express at least one of special use limitation statements:

instead of values use:

- “unknown” if the constraints related to the resources have not been documented;
- “no restriction applied” if the intent is effectively to release the resource without any constraint

The use limitation statement is not expected to express the fitness for use of the resource, but it can express that a resource does not meet the requirements for certain application. Such a typical statement is *“not to be used for navigation”* for maritime maps or resources not satisfying the requirements for a safe navigation.

### 5.2.12 Lineage

This is general information for reporting a non-qualitative statement on process history and/or overall quality report. It is an easy way of giving a short quality report, which INSPIRE requires in article 5-2 (c). Since this is an INSPIRE requirement it is recommended to use expressions such as “unknown” if no information is available.

### 5.2.13 Service type version

This element is strongly associated with the service type element. While the service type element identifies the type of the service instance, the service type version specifies the version number of the underlying specification this service instance complies with. Both elements (service type and service type version) specify exactly a well known service type.

### 5.2.14 Operation name

This element specifies the name of one operation of the service instance. This name is used to invoke the service interface within the context of the distributed computing platform (DCP - (see below). This information is necessary for a client to bind to the service.

### 5.2.15 Distributed computing platform

This element describes the distributed computing platform(s) on which the service instance is deployed. This information is necessary for a client to bind to the service.

### 5.2.16 Resource identifier

This element describes an unambiguous reference to the resource in a given context. The definition of identifier encoding is the task of the Drafting Team "Data Specification". The information is useful to directly access the resource. See section 6.2 for further information on identifiers.

### 5.2.17 Spatial resolution

The spatial resolution is an indicator of the level of detail of the data related to a spatial resource. It can be expressed as an equivalent scale (typically, for maps or map-derived products), or a resolution distance for gridded data and imagery-derived products. Spatial resolution provides a rough indication of the accuracy and potential quality of a spatial resource. It can be used, for example, to eliminate those resources that do not provide the minimum level of detail needed for a specific task.

### 5.2.18 Conformity

Conformity refers to the requirement of the Directive in Article 5-2(a) that metadata shall include information on the conformity of spatial data sets with the IR provided in Art. 7-1 which refer to the interoperability and where practicable harmonization of spatial data sets and services.

## 5.3 Basic Requirements

The previous section provides a general description of the metadata elements used for discovery. In this section, information regarding implementation of these elements as part of a set of metadata describing a resource is given.

### 5.3.1 Notation

The basic requirements are expressed for each discovery level in a dedicated table providing for each metadata element the following information:

- the name of the element
- whether the element can be used as part of a search request. The discovery service supports these elements as queryables.
- the multiplicity of a metadata element in the result set of a search request. The expression of the multiplicity follows the UML notation for multiplicity.
  - 1 means that there shall be only one instance of this metadata element in a result set.
  - 1..\* means that there shall be at least one instance of this element in a result set.
  - 0..1 indicates that the presence of the metadata element in a result set is conditional but can occur only once.

- 0..\* indicates that the presence of the metadata element in a result set is conditional but the metadata element may occur once or more.
- No multiplicity implies that the metadata element is not part of the response.
- a conditional statement if the multiplicity of the element does not apply to all types of resources .

### 5.3.2 Abstract discovery metadata element set – Discovery level - 1

The abstract metadata elements for discovery level 1 are shown in Table 1.

**Table 1 - Abstract discovery metadata element set – level 1**

Metadata element	Search	Response	Condition
Resource title	X	1	
Temporal reference	X	1..*	When the content selection by temporal extent is meaningful One of the dates of publication, last revision or creation of the resource is mandatory
Geographic extent of the resource	X	0..*	Mandatory for datasets and dataset series
Resource language	X	0..*	When dataset or dataset series has textual information
Resource topic category	X	0..*	Mandatory for datasets and dataset series
Keyword	X	1..*	
Service type	X	0..*	If the resource is a service
Resource responsible party		1..*	
Abstract		1	
Resource locator		0..*	When a linkage to the resource or a contact point for more information about the resource is available

### 5.3.3 Abstract discovery metadata element set – Discovery level - 2

The abstract metadata elements for discovery level 2 are shown in Table 2.

**Table 2 - Abstract discovery metadata element set – discovery level 2**

Metadata element	Search	Response	Condition
Constraints		0..*	When there are constraints regarding access or usage
Lineage		0..1	When a quality report or other lineage statements are required
Conformity		0..*	Mandatory for datasets and dataset series
Service type version		0..*	If the service is a well known service type
Operation name		0..*	If the resource is a service
Distributed computing platform		0..*	If the resource is a service
Resource Identifier		0..1	If an identifier is available
Spatial resolution		0..1	Mandatory for datasets and dataset series if a unique equivalent scale or resolution distance can be specified <sup>10</sup>

<sup>10</sup> For some datasets and dataset series, a unique spatial resolution cannot be specified. Examples are point-datasets (e.g. measurement data attributed to a specific monitoring station) or complex dataset series that contain multiple datasets at different scales (e.g. a thematic atlas).

### 5.3.4 Implementation instructions of the abstract discovery set

Because of the need to translate the abstract set to the implementation of ISO 19115/ISO 19119, Dublin Core and other standards, the abstract set needs more detail at the general level for the different implementations. These details are provided in Table 3.

**Table 3 - Implementation instructions for the abstract discovery metadata element**

Metadata element	User instructions	Example	Domain
Resource title	It is recommended to use a meaningful and unique name, if possible.	Mastermap	free text
Temporal reference <sup>11</sup>	Describe the temporal period the resource refers to and the reference date of the cited resource.  Time locations are measured relative to a temporal reference system as specified by ISO 8601.	2006:01:01-2006:01:31  2006-01-20, publication	ISO 19108, DateTime
Geographic extent of the resource	Describe the geographic area the resource refers to. Use a bounding box, polygon or a geographic identifier	Long: -30.0 Lat: 35.0 Long: 50.0 Lat: 70.0  Europe	ISO 19115
Resource language	Describe the main language used for text in the resource by using ISO 639-2 standard. CEN member states should check if their language is represented on this list.	Nor	ISO 639-2

<sup>11</sup> The DT Metadata has recognized that an requirement for specifies searches on named periods in an ordinal temporal reference system, or periods where one or more nodes are indeterminate but which on any specific search may be exactly specified as a date or time could be needed. This is because some temporal information is known more accurately by relative position than by absolute time, and in such cases an ordinal temporal reference system is used. Examples are geological eras (such as Jurassic, Triassic or Cretaceous) or climatologically eras (spring, summer, autumn, winter). Names in an ordinal temporal reference system are equivalent to names in a gazetteer. Some temporal references are indeterminate, in that generally they cannot be pre-defined in metadata, but in use they are specific. A data set which contains only today's data or data for the last 24 hours or forecasts for the next week (e.g. weather data) cannot have the dates exactly defined in metadata, but in use the dates and times can be defined precisely.

A pilot study in conjunction with DT Metadata, JRC and communities with a temporal use case as described here will be done in the first half year of 2007. The motivation for this pilot is to decide how this requirement should be implemented in the IR Metadata.

Resource topic category	Specify one or more high-level topic categories for the resource, using the respective ISO19115 code list. Annex E contains the mapping from the INSPIRE spatial data themes to the code list.	Boundaries	code list B.5.27 from ISO 19115
Keyword	Give one or more keywords that describe the thematic content of the resource. It is strongly recommended that keywords are used from formalized thesaurus.	topography, roads	free text
Service type <sup>12</sup>	Specify a service type in a standardized format (INSPIRE code list)	WMS, WFS	ISO 19119
Resource responsible party	Use the full name of the responsible organisation. The abbreviations can be in addition to the organisation name.	European Commission Directorate General Joint Research Centre (JRC)	free text
Abstract	Provide a short but exact description of the resource	Dataset contains large scale (1:1.000) topography, which covers the whole country	free text
Resource locator	Specify a valid URL to a dataset/dataset series or a service. If no direct link to resource is available, provide a link to a responsible party of the resource where more information about resource is available.	<a href="http://www.geonorge.no/">http://www.geonorge.no/</a>	URL
Constraints - Access <sup>13</sup>	Specify any legal or proprietary constraints that limit the free access to the resource.	Copyright or other restrictions - unknown	code list B.5.24 from ISO 19115
Constraints – use Limitations <sup>14</sup>	Specify any constraints in terms of feasibility or quality that limit the use of the resource	Maritime map cannot be used for safe navigation	free text

<sup>12</sup> DT network services has been asked if it is possible to produce a code list. If yes, this will be a deliverable of the DT network services.

<sup>13</sup> This is a task for the DT data sharing.

<sup>14</sup> This is a task for the DT data sharing.

Lineage	In addition to general explanation of the data producer's knowledge about the lineage of a dataset it's possible to give here data quality statements.	In this dataset, the boundaries between the North Sea and the provinces are the borders between land en water, not the administrative boundaries.  or  Data have been digitised from the standard 1:5.000 map.	free text
Conformity <sup>15</sup>	Describes the conformity of the dataset and dataset series with the rules of Article 7(1)	See Annex F	See Annex F
Service type version	Specify the version number of a well known service type	1.1.0	ISO 19119
Operation name	Specify the invocation name for a service interface	GetCapabilities, GetMap, GetRecords	ISO 19119
Distributed computing platform	Specify the distributed computing platform(s) the service instance is deployed to.	WebServices	ISO 19119
Resource identifier	Identifier of the resource	urn:opengis:specification:gml:schema-xsd:coordinateSystems:3.1.1  or  64075d21-fa6a-43d5-9972-c75bd978304b	free text
Spatial resolution	Use for equivalent scale denominator and for resolution distance metres	Equivalent scale: 50000  Resolution distance: 3.0	Integer  ISO/TS 19103

<sup>15</sup> The conformity will be provided by DT Data specifications (see annex F)

## 6 General Implementing Rules

### 6.1 Metadata on metadata

#### 6.1.1 Motivation of the abstract metadata on metadata set

##### 6.1.1.1 Metadata point of contact

Identifies the party or person responsible for the metadata creation and maintenance. It is important information to identify and communicate with the person(s) or organizations associated with the metadata of the resource (for example to find out if the metadata are up-to-date or to ask for an update of the information).

This metadata element is mandatory to be in conformance with ISO 19115.

##### 6.1.1.2 Metadata date stamp

Date, which specifies when the metadata record was created or updated. Gives an indication of the currency of the metadata.

This metadata element is mandatory to be in conformance with ISO 19115.

##### 6.1.1.3 Metadata language

The main language used in the metadata record. This is an important element in multi-lingual environments and catalogues for the parameterisation of multi-lingual catalogue user-interfaces.

#### 6.1.2 Abstract metadata on metadata set

To deal with the system metadata and mandatory metadata needed for metadata management, the following metadata elements have to be supported.

**Table 5 - Abstract metadata on metadata element set – discovery level 2**

Metadata element	Search	Response	Condition
Metadata point of contact		1..*	
Metadata date stamp		1	
Metadata language		0..1	If not defined by encoding

#### 6.1.3 Implementation instructions of the abstract metadata on metadata set

Because of the need to translate the abstract set to the implementation of ISO 19115/ISO 19119, Dublin Core and other standards, the abstract set needs more detail at the general level for the different implementations. These details are pointed out in Table 6.

**Table 6 - Implementation instructions for the abstract metadata on metadata set**

Metadata element	User instructions	Example	Domain
Metadata point of contact	Use the full name of the responsible organisation. The abbreviations can be in addition to the organisation name. When an organisation is not responsible but a person then the name of the person will be filled in	European Commission Directorate General Joint Research Centre (JRC)	free text
Metadata date stamp	Enter the date of creation or (if there was any) of the last update of the metadata record	2005-03-27 (YYYY-MM-DD)	ISO 8601, Date
Metadata language	Specify the main language of the metadata record. This applies mainly to the elements Title, Abstract, and Keywords	dut, nor	ISO 639-2

## 6.2 Identifiers

In the context of INSPIRE, identifiers may be of importance from various points of view:

- Identifying a metadata record itself
- Identifying parts of the metadata record (i.e. the identifier of the spatial reference system)
- Identifying a resource in a given context
- Provision of linkage between metadata record and resource
- Provision of linkage of related metadata records (parent-child relationships, service-dataset coupling)

In any case identifiers might be anonymous and/or unique. This depends strongly on the use cases in which an identifier is created and applied. Furthermore, identifiers have to be distinguished from locators. A locator provides direct access to a resource. In the case of an identifier, this is not necessarily true.

An example for a locator is a Universal Resource Locators (URL) that is a subtype of Universal Resource Identifiers (URI). An URL is expected to provide access to an external resource, while this is not a requirement for a URI. The URI syntax is defined in RFC 2396 (<http://www.ietf.org/rfc/rfc2396.txt>). This specification does not guarantee by itself the uniqueness of the URI, but the uniqueness can be ensured with a given context in a co-ordinated way.

Universally Unique Identifier (UUID) is an identifier standard established by the Open Software Foundation (OSF). The intention of UUIDs is to enable distributed systems to uniquely identify information without significant central co-ordination. Thus, anyone can create a UUID and use it to identify something with reasonable confidence that the identifier will

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataIRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 39 of 104

never be unintentionally used by anyone for anything else. Information labelled with UUIDs can therefore be later combined into a single database without need to resolve name conflicts.

An identifier, even a unique identifier does not need necessarily to be anonymous. Typically, the URI of an XML namespace allows the identification of the responsible body. For example, ISO 19139 base namespace URI is <http://www.isotc211.org/2005/gmx>. Anybody can see through this identifier that information related to ISO 19139 can be found in the ISO/TC 211 web site. Yet, UUID are typically anonymous identifiers which may be useful in some context.

UUIDs are very bad locators but very good unique identifiers, above all when the identifiers need to be anonymous. URLs are very good locators in a distributed environment, but they barely play a role in term of unique identification.

In the context of this document, only resource identifiers are addressed. This means the identifier of a resource that is described by a metadata document might be referred within this document to provide a means to associate metadata documents with related resources. There is no need to define an identifier for the metadata record itself since this is more related to metadata management which is out of scope of the Implementing Rules. The identifier for a resource is a metadata element on discovery level 2.

NOTE: It is assumed that the *DT Data Specification* will define the structure or protocol for identifier of resources. The *DT Metadata* will adopt this specification and harmonize it, if needed, with the requirements defined by this document.

### 6.3 Granularity

The metadata Implementing Rules should define what constitutes a “dataset” as part of a spatial resource.

In Article 4.2, the Directive clarifies that its provisions apply only to the reference version from which various copies are derived, in cases where multiple identical copies of the same spatial data set are held by or on behalf of various public authorities.

In a similar way, in the life cycle of data, data may be at various times collected, transferred to intermediate cache, quality controlled, verified, backed-up, stored for use and re-use, then perhaps replaced with new data, retired, overwritten or transferred to archive.

In this case a reference data set is that which the spatial data services use and which users access. Published metadata need only refer to the reference version of the data set, although if there are different uses of the data at different stages, then there may be a case for distinct metadata and distinct reference versions.

INSPIRE metadata is intended for discovery. This needs sufficient information that a user can find out what data exists, where it is held and by whom, but not so much information that the user’s query is swamped by too many, essentially duplicated, responses.

The first response should give sufficient information such that the user is likely to be able identify ways to narrow his/her search criteria. This will normally narrow the search to the repository which holds the data in question, so that the user can search for more detailed information about the target data. This more detailed information may no longer be “discovery” metadata, but will have extended into “evaluation” or “use” metadata. It is likely to be specific to the particular repository, and certainly specific to the spatial data theme, as defined in INSPIRE.

In this model of a query hierarchy, the discovery metadata should refer to coherent sets or collections of data and datasets, and not to a range of nearly identical component datasets.

In ISO19115 this is described as a dataset series - a "collection of datasets sharing the same product specification".

The discovery metadata should be created for datasets or dataset series, in a manner which would help a user to identify and home in on his or her particular requirements, in the sequence of queries.

In practical terms the data will already be aggregated into an existing database or repository in a pre-defined level of organisation. The user is likely to be required to configure the request for data in a manner which matches the capability of applications to extract data from the repository. In many cases the organisation of the repository will be well aligned with purpose of the data. Again, in many cases this will be in reasonable accord with the user's requirement.

The granularity of the discovery metadata, therefore, should reflect the logical organisation of the data repository at a sufficiently coarse grained level.

As an example, INSPIRE discovery metadata should describe the collection of bore-holes in a geological data repository, not bore-holes at individual sites. If at a geospatial repository, the data are organised in collections which reflect the resolution and coverage, and if the data retrieval mechanisms are organised in this way, then the metadata granularity should reflect this.

On the other hand, if data from distinct and non-overlapping regions, perhaps where the data were collected at different times and to different standards, are easily distinguished, then it might be sensible to make the metadata distinct too.

The choice of the metadata granularity may also be affected by the capability to gather and maintain the metadata. It will often be true that for very-fine grained data collections it may be impossible or prohibitively expensive to harvest a complete set of discovery metadata. The granularity of INSPIRE metadata should therefore be chosen to provide enough information to enable good dataset discovery, and to be able to keep the metadata up to date as required by the Directive (Art. 5-1).

## 7 Implementing Rules for Evaluation

The metadata elements for evaluation are the full responsibility of the INSPIRE Spatial Data Themes communities. The evaluation metadata is supported by ISO 19115 and ISO 19119, and possible user community extension as defined in these standards.

The IR for Metadata describes no profiles of these standards because different INSPIRE Spatial Data Themes communities can have different needs. This means that the metadata elements of ISO 19115 and ISO 19119 are, except from the elements mentioned in chapters 5 and 6, all optional. The IR for Metadata leaves it open to the specific INSPIRE Spatial Data Themes communities to define which elements should be made mandatory or mandatory by condition based on their requirements and practices.

It is acknowledged that some of the resources in the scope of the INSPIRE Directive do not contain spatial data (an environmental report, for example), but in such a case they are georeferenced through their metadata, i.e. their geographic extent. The presence of metadata related to the reference system of the resource is highly recommended for the purpose of evaluation and use, except of course for those resources.

Annex D gives an overview of the applicability of the ISO TC/211 and OGC standards for evaluation metadata.

## 8 Implementing Rules for Use

The metadata elements for use will be the outcome of the harmonization of the INSPIRE Spatial Data Themes of Annex I and II or non-harmonized data of Annex III. The metadata for use involves complementary standards such as ISO 19109, 19110, 19111, 19111 and others that are defined in the Implementing Rules for data specification.

Annex D gives a brief overview of the applicability of the ISO TC/211 and OGC standards for use metadata.

## Annex A ISO 19115 / ISO 19119 implementation

The XML encoding of ISO 19115 is based on ISO TS 19139. Within the ISO Metadata Application Profile document, a similar XML encoding based on ISO TS 19139 is defined that uses the same long name declaration. This ISO Metadata Application Profile encoding complies with the logical model of ISO 19119 including the elements defined by the ISO 19119 amendment (ISO 19119:2005 PDAM 1) and is used for the service elements of ISO 19119 because they are not specified by ISO TS 19139.

According to ISO 19115, metadata can be defined at different hierarchical levels: dataset series, dataset, feature instance and attribute instance (as stated in Annex G of ISO 19115). ISO 19119 extends these hierarchical levels to services. For these Implementing Rules the following hierarchical levels are:

- Dataset series
- Dataset
- Service

Hierarchy levels shall be described by MD\_ScopeCode codelist values (MD\_Metadata.hierarchyLevel = 'series', 'dataset' or 'service'). A metadata instance with the no hierarchy level or a different hierarchy level is out of the scope of the INSPIRE directive.

This annex is organized as follows:

- Clause A.1 presents the ISO 19139 instance template for INSPIRE Discovery Metadata Elements
- Clauses A.2 and A.3 describe in more detail each INSPIRE metadata element for discovery at levels 1 and 2

### A.1 INSPIRE Discovery Metadata ISO 19139 Encoding Template

#### A.1.1 Introduction

This clause presents the overall structure a metadata set both compliant with ISO 19115 and the INSPIRE abstract discovery metadata elements defined in Chapter 5. This structure is presented as a set of tables describing the properties that must be documented for Level 1 and Level 2 discovery.

The description of each property is composed of:

- The property stereotype expressing one of the following codes:
  - + implies a property instance implemented as an XML Element
  - implies a property instance implemented as an XML Attribute.
- The property label;
- A presence requirement expressed with a cardinality statement between square brackets;
- A colon;
- The property type name. The property type is implemented as a sub element of the property. This sub element can be an instance of the property type or an instance of one of its derived types. In the latter case, the derived type is either an ISO type or an extension type defined in a profile.
- A property instance statement which describes how the property type is implemented.

Additional information is provided in a Note section, at the bottom of each table. Properties for Discovery Level 1 are in blue, properties for Discovery Level 2 are in red.

This hierarchical set of labels acts as an instance Template. This template only shows the properties in the scope of the INSPIRE discovery metadata elements, which encompass the

mandatory properties of ISO 19115 and ISO 19115-2. The other optional properties of ISO 19115 are not described, but can be present in a real instance. Additional properties defined in a profile of ISO 19115 or ISO 19115-2 compliant with the INSPIRE abstract discovery metadata element set can be expressed but are not documented here.

## A.1.2 Resource MetadataSet

An INSPIRE Discovery Metadata Set that complies to ISO 19139 and the INSPIRE Metadata Profile defined in this document is an instance of the class MD\_Metadata (from ISO 19115), the class MI\_Metadata (from ISO 19115-2) or an instance of any community specialisation of one of these two classes. The sub-elements of this root element are described hereafter.

### A.1.2.1 Instance template of the Metadata Entity Set Section

The following instance template handles:

- the metadata fields of the Metadata Entity Set section
- the metadata fields of the Distribution Information section
- the metadata fields of the Data Quality Information section
- the entry point to the Identification Section

```
+language [0..1] : CharacterString ..... E.g. dut
+hierarchyLevel [0..*] : MD_ScopeCode ..... Values in the scope of INSPIRE: dataset, series or service
+contact [1..*] : CI_ResponsibleParty
+ individualName [0..1] : CharacterString ..... Mandatory if the responsible body is not an organisation
+ organisationName [0..1] : CharacterString ..... E.g. European Commission Directorate General Joint Research
Centre (JRC). See 1
+ role [1] : CI_RoleCode ..... One of the value of the CodeList CI_RoleCode. E.g. custodian
+dateStamp [1] : Date ..... Format YYYY-MM-DD. E.g. 2005-03-27
+identificationInfo [1] : MD_DataIdentification ..... See A.1.2.2
+distributionInfo [0..*] : MD_Distribution ..... See 2
+ transferOptions [0..*] : MD_Format
+ online [0..*] : CI_Onlineresource
+ linkage [1] : URL ..... E.g. http://www.geonorge.no/
+dataQualityInfo [0..*] : DQ_DataQuality ..... See 3
+ lineage [0..1] : LI_Lineage
+ statement [0..1] : CharacterString ..... Ex : Data have been digitised from the standard 1:5.000 map. See 4
```

#### Notes :

1. The abbreviation can be used in addition to the organization name.
2. Mandatory when a linkage to a resource or a contact point for more information about the resource is available.
3. Mandatory when a quality report or other lineage statements are required
4. In addition to general explanation of the data producer's knowledge about the lineage of a dataset, it is possible to give here data quality statements

### A.1.2.2 Identification Section

Depending on the value of the element hierarchyLevel (dataset, series or service), the Identification Section is either instantiated through:

- an element named MD\_DataIdentification or derived from MD\_Identification (e.g., MI\_DataIdentification from ISO 19115-2) in the case of a dataset or a series; or
- an Element named MD\_ServiceIdentification or derived from SV\_ServiceIdentification

These two cases are described hereafter.

## Sub-elements for dataset and series resources

+ citation [1] : CI_Citation	
+title [1] : CharacterString	Name by which the cited resource is known. E.g. Mastermap
+date [1] : CI_Date	See 5
+date [1] : Date	Format: YYYY-MM-DD. E.g. 2006-01-20
+dateType [1] : CI_DateTypeCode	Either creation, revision or publication. E.g. publication
+identifier [0..1] : MD_Identifier	Mandatory if an identifier is available
+code [1] : CharacterString	E.g. urn:ogc:specification:gml:schema-xsd:coordinateSystems:3.1.1
+authority [0..1] : CI_Citation	Person or party responsible for maintenance of the namespace
+ abstract [1] : CharacterString	E.g. Dataset contains large scale (1:1.000) topography
+ pointOfContact [1..*]: CI_ResponsibleParty	Organisation name or individual name is mandatory
+individualName [1..*]: CharacterString	See 6. E.g. Smith, John
+organisationName [1..*]: CharacterString	See 7. E.g. European Commission Directorate General Joint Research Centre (JRC)
+role [1] : CI_RoleCode	E.g. owner
+ spatialResolution [0..1]: MD_Resolution	See 8
+ language [0..*]: CharacterString	Language(s) used within the datasets. See 9. E.g. fin
+ topicCategory [1..*]: MD_TopicCategoryCode	Main theme(s) of the dataset. See 10. E.g. boundaries
+ resourceConstraints [0..*] : MD_LegalConstraints	Mandatory when there are constraints regarding access or usage
+useLimitation [0..*]: CharacterString	E.g. Not to be used for navigation
+accessConstraints [1] : MD_RestrictionCode	E.g. copyright
+ extent [0..*] : EX_Extent	
+geographicElement [1..*]: EX_GeographicBoundingBox	See 11
+westBoundLongitude [1] : Decimal	E.g. 2.50
+eastBoundLongitude [1] : Decimal	E.g. 5.80
+southBoundLatitude [1] : Decimal	E.g. 51.80
+northBoundLatitude [1] : Decimal	E.g. 54.60
+geographicElement [0..*]: EX_GeographicDescription	See 12
+geographicIdentifier [1]: MD_Identifier	
+ code [1] : CharacterString	E.g. Hannover
+ authority [0..1] : CI_Citation	Person or party responsible for maintenance of the namespace.
+temporalElement [0..*]: EX_TemporalExtent	See 13
+extent [1] : TM_TimePeriod	Interval expressed as two dates and times.
+ descriptiveKeywords [1..*]: MD_Keywords	
+keyword [1..*]: CharacterString	E.g. climatological data
Notes :	
5.	One date of type publication, last revision or creation of the resource is mandatory
6.	Name of the responsible person - surname, given name, title separated by a delimiter. Use the full name of the responsible person.
7.	Use the full name of the responsible organisation. The abbreviations can be in addition to the organisation name
8.	Mandatory for datasets and dataset series if a unique equivalent scale or resolution distance can be specified.
9.	In INSPIRE environment, use only three-letter codes defined in ISO639-2/B (bibliographic codes), defined at <a href="http://www.loc.gov/standards/iso639-2/">http://www.loc.gov/standards/iso639-2/</a> .
10.	Annex E defines the mapping from the INSPIRE spatial data themes to the ISO dataset topic category.
11.	Mandatory for datasets and dataset series. The bounding box shall be as small as possible. ISO TS 19139 requires 2 decimals.
12.	Mandatory for datasets and dataset series where the element EX_GeographicBoundingBox is not defined
13.	Mandatory when it is meaningful for discovering and selecting the resource

## Sub-elements for service resources

+ citation [1] : CI_Citation	
+title [1] : CharacterString .....	E.g. GeoOgcWms
+date [1] : CI_Date .....	See 14
+date [1] : Date .....	Format: YYYY-MM-DD. E.g. 2006-01-20
+dateType [1] : CI_DateTypeCode .....	Either creation, revision or publication. E.g. publication
+identifier [0..1] : MD_Identifier .....	Mandatory if an identifier is available
+code [1] : CharacterString .....	E.g. urn:ogc:serviceType:WMS:1.0
+authority [0..1] : CI_Citation .....	Person or party responsible for maintenance of the namespace
+ abstract [1] : CharacterString .....	E.g. Tightly-coupled WMS serving large scale (1:1.000) topography
+ pointOfContact [1..*]: CI_ResponsibleParty .....	Organisation name or individual name is mandatory
+individualName [1..*]: CharacterString .....	See 15. E.g. Smith, John
+organisationName [1..*]: CharacterString .....	See 16. E.g. European Commission Directorate General Joint Research Centre (JRC)
+role [1] : CI_RoleCode .....	E.g. owner
+ serviceType [1]: CharacterString .....	See 17. E.g. WMS
+ serviceTypeVersion [0..*]: CharacterString .....	See 18. E.g. 1.3.0
+ extent [0..*]: EX_Extent	
+geographicElement [0..*]: EX_GeographicBoundingBox .....	See 19
+westBoundLongitude [1] : Decimal .....	E.g. 2.50
+eastBoundLongitude [1] : Decimal .....	E.g. 5.80
+southBoundLatitude [1] : Decimal .....	E.g. 51.80
+northBoundLatitude [1] : Decimal .....	E.g. 54.60
+geographicElement [0..*]: EX_GeographicDescription .....	See 20
+geographicIdentifier [1]: MD_Identifier .....	
+ code [1] : CharacterString .....	E.g. Hannover
+ authority [0..1] : CI_Citation .....	Person or party responsible for maintenance of the namespace.
+temporalElement [0..*]: EX_TemporalExtent .....	See 21
+extent [1] : TM_Period .....	Interval expressed as two dates and times.
+ couplingType [1]: SV_CouplingType .....	Either loose, mixed or tight. E.g. tight
+ resourceConstraints [0..*]: MD_LegalConstraints .....	Mandatory when there are constraints regarding access or usage
+useLimitation [0..*]: CharacterString .....	E.g. Serves images only
+accessConstraints [1] : MD_RestrictionCode .....	E.g. copyright
+ descriptiveKeywords [1..*]: MD_Keywords	
+ keyword [1..*]: CharacterString .....	E.g. OGC Web Map Service
+ containsOperations [1..*]: SV_OperationMetadata .....	Description of the operations offered by the service
+ operationName [1]: CharacterString .....	E.g. GetMap
+ DCP [1..*]: DCPList .....	E.g. WebServices
+ connectPoint [1..*]: CI_OnlineResource .....	Handle for accessing the service interface.
+ linkage [1]: URL .....	E.g. http://www.geoserver.nrw.de/GeoOgcWms1.3/servlet/GEPNRW
Notes :	
14.	One date of type publication, last revision or creation of the resource is mandatory
15.	Name of the responsible person – surname, given name, title separated by a delimiter. Use the full name of the responsible person.
16.	Use the full name of the responsible organization. The abbreviations can be in addition to the organization name.
17.	Mandatory when the resource is a service. It is recommended to make use of a code list instead of a character string. This code list describes all the possible service types
18.	Mandatory if the resource is a well-known service type
19.	Mandatory for services in case the coupling type of the service instance equals "mixed" or "tight". The bounding box shall be as small as possible. ISO TS 19139 requires 2 decimals.
20.	Mandatory for "mixed" or "tightly" coupled services where the element EX_GeographicBoundingBox is not defined
21.	Mandatory when it is meaningful for discovering and selecting the resource

## A.2 Abstract discovery metadata element set – Discovery level - 1

### A.2.1 Resource title

Metadata element name	Resource title
ISO definition	Name by which the cited resource is known
ISO 19115 number and name	360 title
XPath	./identificationInfo/citation/*/title/text()
INSPIRE obligation / condition	Mandatory
INSPIRE multiplicity	[1]
Data type	CharacterString
Domain	Free text
Implementing instructions	
Example	Mastermap
Comment	

### A.2.2 Temporal Reference

#### A.2.2.1 temporal extent

Metadata element name	Date – temporal extent
ISO definition	Date and time for the content of the dataset
ISO 19115 number and name	351 extent
XPath	identificationInfo/extent/temporalElement
INSPIRE obligation / condition	C (mandatory when it is meaningful for discovering and selecting the resource)
INSPIRE multiplicity	[0..*] (because this is a set of intervals; each interval consists of 2 DateTimes [0..2])
Data type	Time Period or TimeInstant <sup>16</sup>
Domain	Described in ISO 19108 and ISO 8601
Implementing instructions	
Example	1977-03-10T11:45:30 (YYYY-MM-DDThh:mm:ss) 2005-01-15T09:10:00 (YYYY-MM-DDThh:mm:ss)
Comment	A set of intervals (expressed as two dates and times) will be presented.  Interval sub-types are supported, as follows: instant, set of instants, composite intervals, period, set of periods.

#### A.2.2.2 date

Metadata element name	Date - date
ISO definition	Reference data for the cited resource
ISO 19115 number and name	394 date
XPath	identificationInfo/*/citation/*/date*/date
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1]

<sup>16</sup> ISO19108 describes other domains which might support the INSPIRE requirements for temporal metadata. There are no implementations currently known. ISO19108 allows ordinal temporal extents (TM\_Position values of TM\_OrdinalEras defined within a TM\_OrdinalReferenceSystem) and an indeterminate value of "now" is valid under TM\_Position. ISO 19108 TM\_PeriodDuration also defines the distance in the temporal dimension

Data type	Date (CI_Date)
Domain	Described in ISO 19108 and ISO 8601
Implementing instructions	
Example	1993-01-24 (YYYY-MM-DD)
Comment	This date has to be followed by a data type

### A.2.2.3 Date - publication

Metadata element name	Date - publication
ISO definition	event used for reference data
ISO 19115 number and name	395 dateType
XPath	identificationInfo/*/citation/*/date[identificationInfo/*/dateType/*/text()='publication']*/date
INSPIRE obligation / condition	C (Mandatory if a date- creation or date - revision not used)
INSPIRE multiplicity	[0..1]
Data type	code list
Domain	code list B 5.2 > CI_DateTypeCode=publication
Implementing instructions	
Example	The data when a dataset was published
Comment	The data type has to be followed by a date

### A.2.2.4 Date - revision

Metadata element name	Date - revision
ISO definition	event used for reference data
ISO 19115 number and name	395 dateType
XPath	identificationInfo/*/citation/*/date[identificationInfo/*/dateType/*/text()='revision']*/date
INSPIRE obligation / condition	C (Mandatory if a date- creation or date - publication not used)
INSPIRE multiplicity	[0..1]
Data type	code list
Domain	code list B 5.2 > CI_DateTypeCode=revision
Implementing instructions	
Example	The data when a dataset was revised
Comment	The data type has to be followed by a date

### A.2.2.5 Date - creation

Metadata element name	Date - creation
ISO definition	event used for reference data
ISO 19115 number and name	395 dateType
XPath	identificationInfo/*/citation/*/date[identificationInfo/*/dateType/*/text()='revision']*/date
INSPIRE obligation / condition	C (Mandatory if a date- publication or date - revision not used)
INSPIRE multiplicity	[0..1]
Data type	code list
Domain	code list B 5.2 > CI_DateTypeCode=revision
Implementing instructions	

Example	The data when a dataset was revised
Comment	The data type has to be followed by a date

### A.2.3 Geographic extent of the resource

The geographic extent of the resource describes the geographic location for which the resource applies. This metadata element is only mandatory for datasets and datasets series.

#### A.2.3.1 EX\_GeographicBoundingBox

Metadata element name	Geographic extent of the resource – EX_GeographicBoundingBox
ISO definition	Western-most coordinate of the limit of the dataset extent, expressed in longitude in decimal degrees (positive east)  Eastern-most coordinate of the limit of the dataset extent, expressed in longitude in decimal degrees (positive east)  Southern-most coordinate of the limit of the dataset extent, expressed in latitude in decimal degrees (positive north)  Northern-most coordinate of the limit of the dataset extent, expressed in latitude in decimal degrees (positive north)
ISO 19115 number and name	344 westBoundLongitude 345 eastBoundLongitude 346 southBoundLatitude 347 northBoundLatitude
XPath	identificationInfo//extent//geographicElement/*/westBoundLongitude/text()  identificationInfo//extent//geographicElement/*/eastBoundLongitude/text()  identificationInfo//extent//geographicElement/*/southBoundLongitude/text()  identificationInfo//extent//geographicElement/*/northBoundLongitude/text()
INSPIRE obligation / condition	C (EX_GeographicBoundingBox is mandatory for datasets, dataset series and for services in case that the coupling type of the service instance equals to "mixed" or "tight")
INSPIRE multiplicity	[0..*]
Data type	Decimal

Domain	<p>-180,00 &lt;= West Bounding Longitude Value &lt;= 180,00</p> <p>-180,00 &lt;= East Bounding Longitude Value &lt;= 180,00</p> <p>-90,00 &lt;= South Bounding Latitude Value &lt;= 90,00; South Bounding Latitude Value &lt;= North bounding Latitude Value</p> <p>-90,00 &lt;= North Bounding Latitude Value &lt;= 90,00; North Bounding Latitude Value &gt;= South Bounding Latitude Value</p>
Implementing instructions	The bounding box shall be as small as possible. ISO TS 19139 requires 2 decimals.
Example	2.50 5.80 51.80 54.60
Comment	Two decimals should be used while describing the bounding box.

#### A.2.3.2 EX\_GeographicDescription

Metadata element name	Geographic extent of the resource - EX_GeographicDescription
ISO definition	spatial reference in the form of a label or code that identifies a location (ISO19112)
ISO 19115 number and name	349 geographicIdentifier
ISO TS 19139 path	identificationInfo//extent//geographicElement/*/geographicIdentifier/*/code//text()
INSPIRE obligation / condition	C (EX_GeographicDescription is mandatory for datasets, dataset series and "mixed" or "tightly" coupled services where neither the element EX_GeographicBoundingBox nor EX_BoundingPolygon is defined).
INSPIRE multiplicity	[0..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	A geographic identifier shall be assigned on basis of a documented and generally accessible gazetteer service, code system, or other indirect spatial reference system.
Example	Hannover (City in Germany) D-30169 (Postal Code of Hannover)
Comment	A reference to a gazetteer or gazetteers or other encoding scheme used for the geographic identifier should be given. The gazetteer or encoding schema has to be identifiable.

#### A.2.4 Resource language

Metadata element name	Resource language
ISO definition	Language(s) used within the datasets
ISO 19115 number and name	39 language
ISO TS 19139 path	identificationInfo/*/language/*/text()

INSPIRE obligation / condition	C (mandatory when there is textual information in the resource)
INSPIRE multiplicity	[0..*]
Data type	Code list
Domain	Free text (preferable use of ISO 639-2 but other parts may be used)
Implementing instructions	In INSPIRE environment, use only three-letter codes defined in ISO639-2/B (bibliographic codes), defined at <a href="http://www.loc.gov/standards/iso639-2/">http://www.loc.gov/standards/iso639-2/</a> .
Example	The list of codes for the 20 official EU languages specified at <a href="http://europa.eu/abc/european_countries/languages/">http://europa.eu/abc/european_countries/languages/</a> is: Czech – <b>cze</b> Danish – <b>dan</b> Dutch – <b>dut</b> English – <b>eng</b> Estonian – <b>est</b> Finnish – <b>fin</b> French – <b>fre</b> German – <b>ger</b> Greek – <b>gre</b> Hungarian – <b>hun</b> Italian – <b>ita</b> Latvian – <b>lav</b> Lithuanian – <b>lit</b> Maltese – <b>mlt</b> Polish – <b>pol</b> Portuguese – <b>por</b> Slovak – <b>slo</b> Slovenian – <b>slv</b> Spanish – <b>spa</b> Swedish – <b>swe</b> The following addition is announced for 1 January 2007: Irish – <b>gle</b>
Comment	In the case INSPIRE the concepts datasets can in this case be extended to also cover services i.e. the definition of the element is: Language(s) used within the resource

### A.2.5 Resource topic category

Metadata element name	Resource topic category
ISO definition	Main theme(s) of the dataset
ISO 19115 number and name	41 topicCategory
ISO TS 19139 path	identificationInfo/*/topicCategory/*/text()
INSPIRE obligation / condition	C (mandatory for datasets and dataset series)
INSPIRE multiplicity	[0..*]
Data type	Code list
Domain	Code list B.5.27 in Annex B of ISO 19115:2003
Implementing instructions	Annex E defines the mapping from the INSPIRE spatial data themes to the ISO dataset topic category.
Example	boundaries
Comment	

### A.2.6 Keyword

Metadata element name	Keywords
ISO definition	Commonly used word(s) or formalised word(s) or phrase(s) used to describe the subject
ISO 19115 number and name	53 keyword
ISO TS 19139 path	MD_Metadata.identificationInfo>MD_Identification.descriptiveKeywords>MD_Keywords.keywords identificationInfo/*/descriptiveKeywords/*/keyword//text()
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	
Example	Sweden, climatological data
Comment	A thesaurus will be recommended

### A.2.7 Service type

Metadata element name	Geographic service
ISO definition	A service type name from a registry of services.
ISO 19119 name	serviceType
CSW2 AP ISO path	MD_Metadata.identification.SV_ServiceIdentification.serviceType identificationInfo/*/serviceType//text()
INSPIRE obligation / condition	C (mandatory if a service is available)
INSPIRE multiplicity	[0..*]
Data type	Free text
Domain	CharacterString
Implementing instructions	Specify a service type in a standardized format (ISO code list)
Example	WMS WFS WCS
Comment	It is recommended to make use of a code list instead of a character string. This code list describes all the possible service types. When everyone uses this code list the user find all the services with "WMS" (instead of "Web Mapping Service", "OGC_WMS" or "web mapping service"). Such a code list has to implemented and maintained as an electronic service by an authoritative organisation.  NOTE: Possible values of this code list will be defined by DT Network services and referred by this IR.

## A.2.8 Resource responsible party

### A.2.8.1 Resource responsible party – individual name

Metadata element name	Resource responsible party – individual name
ISO definition	Name of the responsible person - surname, given name, title separated by a delimiter
ISO 19115 number and name	375 individualName
ISO TS 19139 path	identificationInfo// pointOfContact// individualName/*/text()
INSPIRE obligation / condition	M (organisation name or individual name is mandatory)
INSPIRE multiplicity	[1..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	Use the full name of the responsible person.
Example	Smith, John
Comment	

### A.2.8.2 Resource responsible party – organisation name

Metadata element name	Resource responsible party – organisation name
ISO definition	name of the responsible organisation
ISO 19115 number and name	376 organisationName
ISO TS 19139 path	identificationInfo// pointOfContact// organisationName/*/text()
INSPIRE obligation / condition	M (organisation name or individual name is mandatory)
INSPIRE multiplicity	[1..*]
Data type	Character string
Domain	Free text
Implementing instructions	Use the full name of the responsible organisation. The abbreviations can be in addition to the organisation name.
Example	European Commission Directorate General Joint Research Centre (JRC)
Comment	

### A.2.8.3 Resource responsible party – role

Metadata element name	Resource responsible party – role
ISO definition	function performed by the responsible party
ISO 19115 number and name	379 role
ISO TS 19139 path	identificationInfo// pointOfContact// role/*/text()
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1]
Data type	code list
Domain	code list B.5.5
Implementing instructions	
Example	Owner
Comment	

## A.2.9 Abstract

Metadata element name	Abstract
ISO definition	Brief narrative summary of the content of the resource(s)
ISO 19115 number and name	25 abstract
ISO TS 19139 path	identificationInfo// abstract/*/text()
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1]
Data type	CharacterString
Domain	Free text
Implementing instructions	
Example	Dataset contains large scale (1:1.000) topography, which covers the whole country
Comment	

## A.2.10 Resource locator

### A.2.10.1 Resource locator – linkage

Metadata element name	Resource locator – linkage
ISO definition	Location (address) for on-line access using a Uniform Resource Locator address or similar addressing scheme
ISO 19115 number and name	397 linkage
ISO TS 19139 path	distributionInfo// transferOptions// onLine// linkage/*/text()
INSPIRE obligation / condition	C (When a linkage to the resource or a contact point for more information about the resource is available)
INSPIRE multiplicity	[0..*]
Data type	URL
Domain	URL (IETF RFC1738 IETF RFC 2056)
Implementing instructions	Specify a valid URL to a dataset/dataset series or a service. If no direct link to a resource is available, provide link to a point of contact where more information about the resource is available.
Example	<a href="http://www.geonorge.no">http://www.geonorge.no</a>
Comment	

### A.2.10.2 Resource locator – connect point

Metadata element name	Resource locator - connect point
ISO definition	Handle for accessing the service interface.
ISO 19119 name	connectPoint
CSW2 AP ISO path	identificationInfo// containsOperations// connectPoint// linkage/*/text()
INSPIRE obligation / condition	C (mandatory if the resource is a service)
INSPIRE multiplicity	[0..*]
Data type	CharacterString
Domain	URL
Implementing instructions	
Example	<a href="http://www.geoserver.nrw.de/GeoOgcWms1.3/servlet/GEPNRW">http://www.geoserver.nrw.de/GeoOgcWms1.3/servlet/GEPNRW</a>
Comment	

## A.3 Abstract discovery metadata element set – Discovery level - 2

### A.3.1 Constraints

#### A.3.1.1 Constraints – Access

Metadata element name	Constraints - Access
ISO definition	Access constraints applied to assure the protection of privacy or intellectual property, and any special restrictions or limitations on obtaining the resource or metadata
ISO 19115 number and name	70 accessConstraints
ISO TS 19139 path	//identificationInfo//resourceConstraints//accessConstraints/*/text()
INSPIRE obligation / condition	C (mandatory when there are constraints regarding access or usage)
INSPIRE multiplicity	[0..*]
Data type	Code list
Domain	Code list B.5.24 in Annex B of ISO 19115:2005
Implementing instructions	
Example	copyright
Comment	An empty element means that there are no access constraints.

#### A.3.1.2 Constraints – use limitations

Metadata element name	Constraints – use limitations
ISO definition	Limitation affecting the fitness for use of the resource or metadata.
ISO 19115 number and name	68 useLimitations
ISO TS 19139 path	//identificationInfo//resourceConstraints//useLimitation/*/text()
INSPIRE obligation / condition	C (mandatory when there are constraints regarding access or usage)
INSPIRE multiplicity	[0..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	
Example	Not to be used for navigation
Comment	

### A.3.2 Lineage

Metadata element name	Lineage
ISO definition	General explanation of the data producer's knowledge about the lineage of a dataset
ISO 19115 number and name	83 statement
ISO TS 19139 path	//dataQualityInfo//lineage//statement
INSPIRE obligation / condition	C (when a quality report or other lineage statements are required)
INSPIRE multiplicity	[0..1]
Data type	CharacterString
Domain	Free text
Implementing instructions	In addition to general explanation of the data producer's knowledge about the lineage of a dataset it's possible to give here data quality statements.

Example	In this dataset, the boundaries between the North Sea and the provinces are the borders between land and water, not the administrative boundaries
Comment	

### A.3.3 Conformity

Metadata element name	Conformity
ISO definition	value (or set of values) obtained from applying a data quality measure or the outcome of evaluating the obtained value (or set of values) against a specified acceptable conformance quality level
ISO 19115 number and name	107 result
ISO TS 19139 path	//dataQualityInfo//DQ_DomainConsistency//result
INSPIRE obligation / condition	C (mandatory for datasets and dataset series)
INSPIRE multiplicity	[0..*]
Data type	Code list
Domain	Code list implemented as an URI for INSPIRE
Implementing instructions	
Example	<a href="http://www.inspire.eu/conformance">http://www.inspire.eu/conformance</a>
Comment	

### A.3.4 Service type version

Metadata element name	serviceTypeVersion
ISO definition	Specify the version number of a well known service type
ISO 19119 name	serviceTypeVersion
CSW2 AP ISO path	//identificationInfo//serviceTypeVersion
INSPIRE obligation / condition	C (mandatory if the resource is a well-known service type)
INSPIRE multiplicity	[0..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	Versions separated by . No . at the end
Example	1.1.0
Comment	Provides for evaluation based on the version of serviceType. For example, a user may only be interested in OGC Catalogue services with version 2.0.1.

### A.3.5 Operation name

Metadata element name	operationName
ISO definition	A unique identifier for this interface.
ISO 19119 name	operationName
CSW2 AP ISO path	// identificationInfo// containsOperations// operationName/*/text()
INSPIRE obligation / condition	C (mandatory if the resource is a service)
INSPIRE multiplicity	[0..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	Can be related with serviceType and serviceTypeVersion. Defaults can be loaded automatically by application. There

	should be a possibility to add additional operations.
Example	GetCapabilities, GetMap, GetRecords
Comment	

### A.3.6 Distributed computing platform

Metadata element name	Distributed computing platform
ISO definition	Distributed Computing Platforms on which the operation has been implemented.
ISO 19119 name	DCP
CSW2 AP ISO path	// identificationInfo//containsOperations//DCP/*/text()
INSPIRE obligation / condition	C (mandatory if the resource is a service)
INSPIRE multiplicity	[0..*]
Data type	CharacterString
Domain	Code list
Implementing instructions	
Example	WebServices
Comment	

### A.3.7 Resource Identifier

Metadata element name	Resource identifier
ISO definition	value uniquely identifying an object within a namespace
ISO 19115 number and name	207 code
ISO TS 19139 path	//identificationInfo// citation//identifier//code
INSPIRE obligation / condition	C (mandatory if an identifier is available)
INSPIRE multiplicity	[0..1]
Data type	CharacterString
Domain	Free text
Implementing instructions	
Example	527c4cac-070c-4bca-9aaf-92bece7be902
Comment	

### A.3.8 Spatial resolution

#### A.3.8.1 Equivalent scale

Metadata element name	Equivalent scale
ISO definition	level of detail expressed as the scale of a comparable hardcopy map or chart
ISO 19115 number and name	60 equivalentScale
ISO TS 19139 path	//identificationInfo//spatialResolution//equivalentScale//denominator
INSPIRE obligation / condition	C (mandatory for datasets and dataset series for which a unique equivalent scale or resolution distance can be specified )
INSPIRE multiplicity	[0..1]
Data type	Integer
Domain	> 0
Implementing instructions	
Example	50000
Comment	

### A.3.8.2 Resolution distance

Metadata element name	Resolution distance
ISO definition	ground sample distance
ISO 19115 number and name	61 distance
ISO TS 19139 path	//identificationInfo//spatialResolution//distance
INSPIRE obligation / condition	C (equivalent scale or resolution distance has to be mandatory for dataset and dataset series)
INSPIRE multiplicity	[0..1]
Data type	Integer
Domain	Metres
Implementing instructions	
Example	3.0
Comment	

## A.4 Metadata on metadata

### A.4.1 Metadata point of contact

#### A.4.1.1 Metadata point of contact – individual name

Metadata element name	Metadata point of contact – individual name
ISO definition	Name of the responsible person - surname, given name, title separated by a delimiter
ISO 19115 number and name	375 individualName
ISO TS 19139 path	./contact//individualName
INSPIRE obligation / condition	M (organisation name or individual name is mandatory)
INSPIRE multiplicity	[1..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	Use the full name of the responsible person.
Example	Smith, John
Comment	

#### A.4.1.2 Metadata point of contact – organisation name

Metadata element name	Metadata point of contact – organisation name
ISO definition	Name of the responsible organisation
ISO 19115 number and name	376 organisationName
ISO TS 19139 path	./contact//organisationName
INSPIRE obligation / condition	M (organisation name or individual name is mandatory)
INSPIRE multiplicity	[1..*]
Data type	CharacterString
Domain	Free text
Implementing instructions	Use the full name of the responsible organisation. The abbreviations can be in addition to the organisation name.
Example	European Commission Directorate General Joint Research Centre (JRC)
Comment	

#### A.4.1.3 Metadata point of contact – role

Metadata element name	Metadata point of contact – role
ISO definition	Function performed by the responsible party
ISO 19115 number and name	379 role
ISO TS 19139 path	./contact//role
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1]
Data type	CharacterString
Domain	Code list B.5.5 in Annex B of ISO 19115:2005
Implementing instructions	
Example	owner, distributor or pointOfContact
Comment	

#### A.4.2 Metadata date stamp

Metadata element name	Metadata date stamp
ISO definition	Date that the metadata was created
ISO 19115 number and name	9 dateStamp
ISO TS 19139 path	./dateStamp
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1]
Data type	Date
Domain	ISO 8601
Implementing instructions	
Example	2005-03-27 (YYYY-MM-DD)
Comment	

#### A.4.3 Metadata language

Metadata element name	Resource language
ISO definition	Language used for documenting metadata
ISO 19115 number and name	3 language
ISO TS 19139 path	./language
INSPIRE obligation / condition	C (mandatory if not defined by the encoding)
INSPIRE multiplicity	[0..1]
Data type	Code list
Domain	Free text (preferable use of ISO 639-2 but other parts may be used)
Implementing instructions	Member states should check if their language is represented on this list.
Example	dut, nor
Comment	

## Annex B Dublin Core implementation of discovery level-1

### B.1 Resource title

Metadata element name	Resource title
DC definition	A name given to the resource.
DC label	Title
DC path	dc:title
INSPIRE obligation / condition	Mandatory
INSPIRE multiplicity	[1]
Data type	SimpleLiteral
Domain	-
Implementing instructions	
Example	Mastermap
DC comment	Typically, a Title will be a name by which the resource is formally known.

### B.2 Reference date

#### B.2.1 Extent - temporal extent

Metadata element name	Extent – temporal extent
DC definition	Temporal characteristics of the intellectual content of the resource.
DC label	Temporal
DC path	dcterms:temporal
INSPIRE obligation / condition	C (mandatory when it is meaningful for discovering and selecting the resource)
INSPIRE multiplicity	[0..1]
Data type	datetime (ISO 8601)
Domain	<a href="http://www.w3.org/TR/NOTE-datetime">http://www.w3.org/TR/NOTE-datetime</a>
Implementing instructions	DCMI Period (dcterms:period), W3CDTF (dcterms:W3CDTF) DCMI Period and W3CDTF are syntax encoding schemes, not elements or refinements.
Example	1977-03-10 (YYYY-MM-DD) 2005-01-15 (YYYY-MM-DD)
DC comment	-

#### B.2.2 Date

Metadata element name	Date - date
DC definition	A date associated with an event in the life cycle of the resource.
DC label	Date
DC path	dc:date
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1]
Data type	datetime (ISO 8601)
Domain	<a href="http://www.w3.org/TR/NOTE-datetime">http://www.w3.org/TR/NOTE-datetime</a>
Implementing instructions	W3CDTF (dcterms:W3CDTF)

Example	1993-01-24 (YYYY-MM-DD)
DC comment	Typically, Date will be associated with the creation or availability of the resource. Recommended best practice for encoding the date value is defined in a profile of ISO 8601 [W3CDTF] and follows the YYYY-MM-DD format.

### B.2.3 Date – publication

Metadata element name	Date – publication
DC definition	Date of formal issuance (e.g., publication) of the resource.
DC label	Issued
DC path	dcterms:issued
INSPIRE obligation / condition	C (Mandatory if a date- creation or date - revision not used)
INSPIRE multiplicity	[0..1]
Data type	datetime (ISO 8601)
Domain	<a href="http://www.w3.org/TR/NOTE-datetime">http://www.w3.org/TR/NOTE-datetime</a>
Implementing instructions	W3CDTF (dcterms:W3CDTF)
Example	1977-03-10 (YYYY-MM-DD)
DC comment	-

### B.2.4 Date – revision

Metadata element name	Date – revision
DC definition	Date on which the resource was changed.
DC label	Modified
DC path	dcterms:modified
INSPIRE obligation / condition	C (Mandatory if a date- creation or date - publication not used)
INSPIRE multiplicity	[0..1]
Data type	datetime (ISO 8601)
Domain	<a href="http://www.w3.org/TR/NOTE-datetime">http://www.w3.org/TR/NOTE-datetime</a>
Implementing instructions	W3CDTF (dcterms:W3CDTF)
Example	1977-03-10 (YYYY-MM-DD)
DC comment	-

### B.2.5 Date – creation

Metadata element name	Date – creation
DC definition	Date of creation of the resource.
DC label	Created
DC path	dcterms:created
INSPIRE obligation / condition	C (Mandatory if a date- publication or date - revision not used)
INSPIRE multiplicity	[0..1]
Data type	datetime (ISO 8601)
Domain	<a href="http://www.w3.org/TR/NOTE-datetime">http://www.w3.org/TR/NOTE-datetime</a>
Implementing instructions	W3CDTF (dcterms:W3CDTF)
Example	1977-03-10 (YYYY-MM-DD)
DC comment	-

### B.3 Geographic extent of the resource

In Dublin Core, the geographic extent of the resource can be defined using either a bounding box or a geographic identifier.<sup>17</sup>

Metadata element name	Geographic extent of the resource
DC definition	Spatial characteristics of the intellectual content of the resource.
DC label	Spatial
DC path	dcterms:spatial
INSPIRE obligation / condition	C
INSPIRE multiplicity	[0..1] (1 bounding box)
Data type	CharacterString
Domain	<p>-180.0 &lt;= West Bounding Longitude Value &lt;= 180.0</p> <p>-180.0 &lt;= East Bounding Longitude Value &lt;= 180.0</p> <p>-90.0 &lt;= South Bounding Latitude Value &lt;= 90.0; South Bounding Latitude Value &lt;= North bounding Latitude Value</p> <p>-90.0 &lt;= North Bounding Latitude Value &lt;= 90.0; North Bounding Latitude Value &gt;= South Bounding Latitude Value</p>
Implementing instructions	See <a href="http://dublincore.org/documents/dcmi-box/">http://dublincore.org/documents/dcmi-box/</a> for instructions
Examples	<p>Western Australia: name=Western Australia; northlimit=-13.5; southlimit=-35.5; westlimit=112.5; eastlimit=129</p> <p>The Western Hemisphere: westlimit=180; eastlimit=0</p> <p>The Tropics: northlimit=23.5; southlimit=-23.5</p>

Metadata element name	Geographic extent of the resource
DC definition	Spatial characteristics of the intellectual content of the resource.
DC label	Spatial
DC path	dcterms:spatial
INSPIRE obligation / condition	C
INSPIRE multiplicity	[0..1]
Data type	CharacterString
Domain	Free Text
Implementing instructions	A geographic identifier shall be assigned on basis of a documented and generally accessible gazetteer service, code system, or other indirect spatial reference system.
Example	<a href="#">City of London</a> ..... (borough) (World, Europe, United Kingdom, England, Greater London, London) [7018906]

NB. In Dublin Core the datatype of both variants above is CharacterString. The fact that DCMI Box is specified as the encoding scheme allows the receiver to interpret the string as a structured value according to the DCMI Box syntax.

<sup>17</sup> It is not possible to define the geographic extent by using a bounding polygon. This is only possible in ISO 19115

## B.4 Resource language

Metadata element name	Resource language
DC definition	A language of the intellectual content of the resource.
DC label	Language
DC path	dc:language
INSPIRE obligation / condition	C (mandatory when there is textual information in the resource)
INSPIRE multiplicity	[0..*]
Data type	SimpleLiteral
Domain	-
Implementing instructions	In INSPIRE environment, use only three-letter codes defined in ISO639-2/B (bibliographic codes), defined at <a href="http://www.loc.gov/standards/iso639-2/">http://www.loc.gov/standards/iso639-2/</a> .
Example	The list of codes for the 20 official EU languages specified at <a href="http://europa.eu/abc/european_countries/languages/">http://europa.eu/abc/european_countries/languages/</a> is: Czech – <b>cze</b> Danish – <b>dan</b> Dutch – <b>dut</b> English – <b>eng</b> Estonian – <b>est</b> Finnish – <b>fin</b> French – <b>fre</b> German – <b>ger</b> Greek – <b>gre</b> Hungarian – <b>hun</b> Italian – <b>ita</b> Latvian – <b>lav</b> Lithuanian – <b>lit</b> Maltese – <b>mlt</b> Polish – <b>pol</b> Portuguese – <b>por</b> Slovak – <b>slo</b> Slovenian – <b>slv</b> Spanish – <b>spa</b> Swedish – <b>swe</b> The following addition is announced for 1 January 2007: Irish – <b>gle</b>
DC comment	Recommended best practice is to use RFC 3066 [RFC3066], which, in conjunction with ISO 639 [ISO639], defines two- and three-letter primary language tags with optional subtags. Examples include "en" or "eng" for English, "akk" for Akkadian, and "en-GB" for English used in the United Kingdom.

## B.5 Resource topic category

Metadata element name	Resource topic category
DC definition	The topic of the content of the resource.
DC label	Subject and Keywords
DC path	dc:subject
INSPIRE obligation / condition	C (mandatory for datasets and dataset series)
INSPIRE multiplicity	[0..*]
Data type	SimpleLiteral
Domain	-
Implementing instructions	Take values from the enumeration class MD_TopicCategory defined by ISO 19115
Example	boundaries

DC comment	Typically, a Subject will be expressed as keywords, key phrases or classification codes that describe a topic of the resource. Recommended best practice is to select a value from a controlled vocabulary or formal classification scheme.
------------	---

## B.6 Keyword

Metadata element name	Keyword
DC definition	The topic of the content of the resource.
DC label	Subject and Keywords
DC path	dc:subject
INSPIRE obligation / condition	C (mandatory for datasets and dataset series)
INSPIRE multiplicity	[0..*]
Data type	SimpleLiteral
Domain	-
Implementing instructions	-
Example	Sweden, climatological data
DC comment	Typically, a Subject will be expressed as keywords, key phrases or classification codes that describe a topic of the resource. Recommended best practice is to select a value from a controlled vocabulary or formal classification scheme.

## B.7 Service type

Metadata element name	Geographic service
DC definition	The nature or genre of the content of the resource.
DC label	Type
DC path	dc:type
INSPIRE obligation / condition	C (mandatory if a service is available)
INSPIRE multiplicity	[0..*]
Data type	SimpleLiteral
Domain	-
Implementing instructions	Always use an instance of dc:type with an appropriate value taken from the DCMI Type Vocabulary (e.g. Service, Dataset etc.). See: <a href="http://dublincore.org/documents/dcmi-terms/#H5">http://dublincore.org/documents/dcmi-terms/#H5</a> . If the type is Service, repeat dc:type with a service type in a standardized format (ISO code list)
Example	WMS, WFS, WCS
DC comment	Type includes terms describing general categories, functions, genres, or aggregation levels for content. Recommended best practice is to select a value from a controlled vocabulary (for example, the DCMI Type Vocabulary). To describe the physical or digital manifestation of the resource, use the Format element.

## B.8 Resource responsible party

To express the role of people and organizations related to the resources, Dublin Core has three elements: dc:creator, dc:contributor and dc:publisher. The elements dc:contributor and dc:publisher can be further refined using relator terms that are maintained by the Library of Congress (See: <http://memory.loc.gov/cocoon/loc.terms/relators/dc-relators.html>).

The following mapping can be used between ISO 19115 role codes and relators:

ISO 19115 Code	Relator term	Refined Dublin Core Element
resourceProvider	<a href="http://www.loc.gov/loc.terms/relators/APP">http://www.loc.gov/loc.terms/relators/APP</a> (Applicant)	

<b>custodian</b>	<a href="http://www.loc.gov/loc.terms/relators/RPY">http://www.loc.gov/loc.terms/relators/RPY</a> (Responsible party)	dc:contributor
<b>owner</b>	<a href="http://www.loc.gov/loc.terms/relators/OWN">http://www.loc.gov/loc.terms/relators/OWN</a> (Owner)	<i>dc.contributor (see note)</i>
<b>user</b> <sup>18</sup>	<a href="http://www.loc.gov/loc.terms/relators/CMM">http://www.loc.gov/loc.terms/relators/CMM</a> (Commentator)	dc:contributor
<b>distributor</b>	<a href="http://www.loc.gov/loc.terms/relators/DST">http://www.loc.gov/loc.terms/relators/DST</a> (Distributor)	dc:publisher
<b>originator</b>	<a href="http://www.loc.gov/loc.terms/relators/ORG">http://www.loc.gov/loc.terms/relators/ORG</a> (Originator)	dc:contributor
<b>pointOfContact</b>	<a href="http://www.loc.gov/loc.terms/relators/EXP">http://www.loc.gov/loc.terms/relators/EXP</a> (Expert)	<i>dc.contributor (see note)</i>
<b>principalInvestigator</b>	<a href="http://www.loc.gov/loc.terms/relators/ORG">http://www.loc.gov/loc.terms/relators/ORG</a> (Originator)	dc:contributor
<b>processor</b>	<a href="http://www.loc.gov/loc.terms/relators/CTB">http://www.loc.gov/loc.terms/relators/CTB</a> (Contributor)	dc:contributor
<b>publisher</b>	<a href="http://www.loc.gov/loc.terms/relators/PBL">http://www.loc.gov/loc.terms/relators/PBL</a> (Publisher)	dc:publisher
<b>author</b>	<a href="http://www.loc.gov/loc.terms/relators/AUT">http://www.loc.gov/loc.terms/relators/AUT</a> (Author)	dc:contributor

Note: The relators 'Owner' and 'Expert' (corresponding to the ISO 19115 role codes **owner** and **pointOfContact**) have no pre-defined refinement relationship with Dublin Core elements. In the case of INSPIRE, these should both be defined as refinements of dc:contributor.

## B.9 Abstract

Metadata element name	Abstract
DC definition	A summary of the content of the resource.
DC label	Abstract
DC path	dcterms:abstract
INSPIRE obligation / condition	M
INSPIRE multiplicity	[1]
Data type	SimpleLiteral
Domain	-
Implementing instructions	
Example	Dataset contains large scale (1:1.000) topography, which covers the whole country
DC comment	

## B.10 Resource locator

Metadata element name	Resource locator
DC definition	An unambiguous reference to the resource within a given context.
DC label	Identifier
DC path	dc:identifier
INSPIRE obligation / condition	C (mandatory when the resource or more information about the resource is available)
INSPIRE multiplicity	[0..*]
Data type	SimpleLiteral
Domain	URI

<sup>18</sup> This role is mostly dedicated to the documentation of user feedback (e.g., through the MD\_Usage class of ISO 19115). In this context, the inputs of the user are comments about the use of the resource. So, the user can be considered as a Dublin Core commentator.

Implementing instructions	-
Example	<a href="http://www.geonorge.no">http://www.geonorge.no</a>
DC comment	Recommended best practice is to identify the resource by means of a string or number conforming to a formal identification system. Example formal identification systems include the Uniform Resource Identifier (URI) (including the Uniform Resource Locator (URL)), the Digital Object Identifier (DOI) and the International Standard Book Number (ISBN).

## Annex C Comparison of INSPIRE directive requirements and corresponding abstract discovery metadata set

In articles 5, 8 and 11, the INSPIRE directive specifies which information about a spatial resource (spatial data set, spatial data set series, service) should be provided by a set of metadata. This Annex gives a comparison of INSPIRE directive requirements and corresponding abstract metadata set.

**Table C.1 - Comparison of INSPIRE directive requirements and corresponding abstract metadata set**

Requirement of INSPIRE Directive	Corresponding abstract metadata element	Discovery metadata category
The conformity of spatial data sets with the implementing rules referred to in Article 7(1); (Art. 5-2 (a) and Art. 11-2 (d))	See Annex F	Discovery level 2
Conditions applying to access to, and use of, spatial data sets and services (Art. 11-2(f)), and where applicable, corresponding fees; (Art. 5-2 (b))	Constraints (access and use limitations)	Discovery level 2
Quality and validity of spatial data; (Art. 5-2 (c) and 11-2c))	See Annex G	
Public authorities responsible for the establishment, management, maintenance and distribution of spatial data sets and services; (Art. 5-2(d) and 11-2(g))	Resource responsible party	Discovery level 1
Limitations on public access and the reasons for such limitations in accordance with Article 13 (Art. 5-2(e))	Constraints (access)	Discovery level 2
Keywords describing a resource (Art. 11- 2 (a))	Keyword	Discovery level 1
Classification of spatial data and services (Art. 11-2 (b))	Resource topic category Service type	Discovery level 1
Geographical location; (Art. 11-2 (e))	Geographic extent of the resource	Discovery level 1
Temporal domain; (Art 8-2 (d)) <sup>19</sup>	Temporal extent of the resource	Discovery level 1

<sup>19</sup> The Directive mentions "information on the temporal domain of the data" in Chapter III Article 8.2 (d), on the Interoperability of Spatial Data sets and Services, though not in Chapter II on Metadata. It also includes themes which are completely time dependent in Annex III (13, Atmospheric conditions; 14, Meteorological geographic features and 15, Oceanographic geographic features) and in Annex II (theme 4, Geology). These themes have primary requirements for metadata on temporal extent for discovery purposes. Other themes may have less or no need of temporal extent for discovery.

## Annex D Applicability of the available standards

### D.1 Introduction

ISO/TC 211 and OGC have both initiated an important standardisation activity related to geographic information and more generally spatial information. If OGC and ISO/TC 211 have their own autonomy and have undertaken overlapping work by the past, a close co-ordination ensures today the consistency between the respective standards. More and more OGC Implementation Specifications are revised by joint ISO/TC 211 and OGC project teams guaranteeing the equivalence of the OGC and ISO publications. OGC Implementation specifications will be referenced hereafter only when they have not been published as ISO standards yet.

The geographic information standards applicable to these Implementing Rules can be seen as presented in Figure D.1.

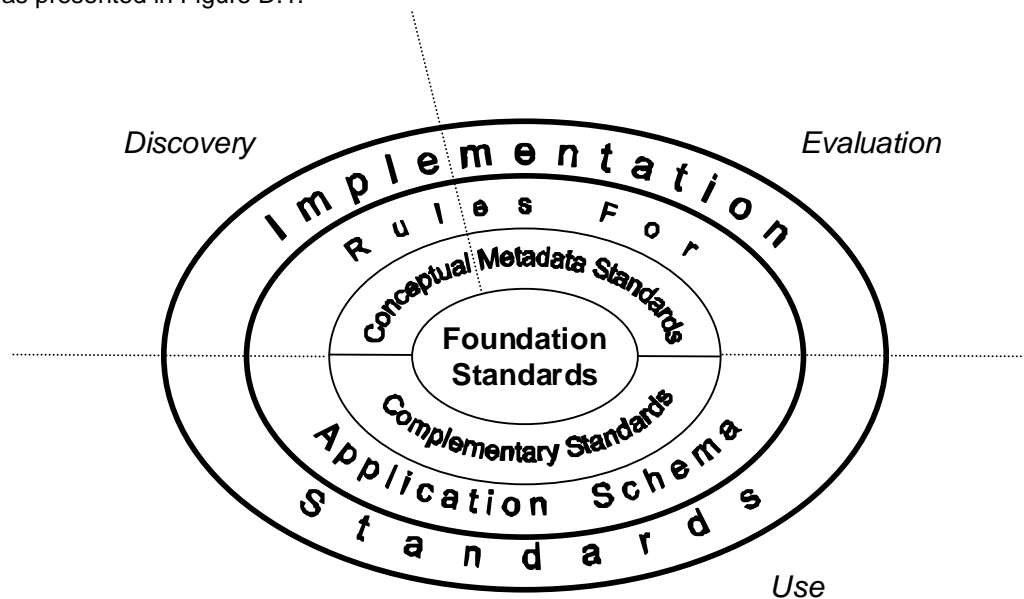

Figure D.1 – Overview of the geographic information standards

Different implementation standards presented in D.4 serve the different discovery, evaluation and use requirements. They act on a set of conceptual standards through rules for application schema documented in **ISO 19109** and summarised in D.3. In the context of these Implementation Rules, the conceptual standards comprise:

- Foundation standards providing base data types (see D.2.2);
- Metadata standards satisfying fully the discovery and evaluation requirements, but partially the use requirements (see D.2.1);
- Complementary standards involved in the use scenario (see D.2.3).

### D.2 Conceptual Spatial Standards

#### D.2.1 Conceptual metadata standards for spatial resources

**ISO 19115** specifies a conceptual schema for geospatial information metadata covering the different metadata sections defined in section 4.1. It is the keystone of these Implementing Rules and is consequently applicable with the following restriction. A set of minor

inconsistencies related directly to **ISO 19115** have been reported in **ISO 19115/Cor.1** which also defines how to interpret them. **ISO 19115/Cor.1** supersedes **ISO 19115**.

**ISO 19115/Cor.1** is particularly important when dealing with spatial services. The class MD\_ServiceIdentification has been renamed SV\_ServiceIdentification for consistency with **ISO 19119** which defines a full conceptual schema for spatial service metadata. The root of this conceptual schema is SV\_ServiceIdentification which creates a strong link between **ISO 19115** and **ISO 19119**. **ISO 19119** is applicable to these Implementing Rules when dealing with spatial services.

The quality principles documented in ISO 19113 have driven the establishment of ISO 19115 conceptual schema, particularly but not only its quality section. These quality principles have to be followed when quality information is included in the metadata.

ISO 19114 standard specifies a methodology for evaluating the quality of geographic information and expresses requirements in term of reporting of the evaluation results. It is acknowledged for the goodness of geographic information users that the quality evaluation proceeded by the managers of the spatial information is generally not provided in details within the metadata. As a result, several quality measures can be aggregated into a single quality measure which is reported in the metadata while the other quality measures have to be expressed in a quality report.

**ISO/CD 19115-2 [9]** is not applicable in this version of the Implementing Rules because the draft specification is not mature enough. This does not impact the discovery activity, but the minimum cataloguing requirements expressed in this version of the Implementing Rules excludes the imagery specificity.

## D.2.2 Conceptual Spatial foundation standards

The conceptual schema for metadata resources defined through **ISO 19115** and **ISO 19119** are based on the following foundation standards:

- **ISO/TS 19103** defines the conceptual schema language of the ISO 19100 series of standards including **ISO 19115** and **ISO 19119**. It specifies a set of basic types widely used in conceptual schemas of the ISO 19100 series of standards.
- **ISO 19107** defines particularly a set of geometric primitives used in **ISO 19115**, for example for describing the spatial extent of a metadata resource.
- **ISO 19108** defines particularly a set of temporal primitives used in **ISO 19115**, for example for describing the temporal extent of a metadata resource.

The part of those standards involved in the implementation of **ISO 19115** and **ISO 19119** are applicable to these Implementing Rules.

## D.2.3 Complementary Conceptual Spatial standards

The conceptual schema defined by **ISO 19115**, **ISO 19119** and the foundation standards (see D.2.2) fully addresses the discovery and evaluation requirements. As soon as the use of the data is envisioned, it is necessary to consider complementary conceptual Spatial standards.

Typically:

- **ISO 19115** in its content information section allows the citation of feature catalogues, but the conceptual schema of feature catalogues is defined in **ISO 19110**.
- **ISO 19115** provides in its reference system information section a means for identification of the reference systems applicable to a resource, but the conceptual schema for spatial reference using coordinates is defined in **ISO 19111** and the conceptual schema for spatial reference by identifiers is defined in **ISO 19112**;
- **ISO 19115** in its portrayal catalogue information section allows the citation of portrayal catalogues, but the conceptual schema of a portrayal catalogues is defined in **ISO 19117**.

The applicability of those complementary conceptual standards is limited to the use activity of the INSPIRE Metadata Use Case.

- **ISO/CD2 19130** extends ISO 19115-2 [9] with a conceptual schema for sensor and data modelling which would be necessary for computation of the location of the cells of non georectified imagery.
- **ISO/TS 19139** define conceptual extensions of **ISO 19115** which are particularly relevant in a use scenario. It is consequently seen as a complementary conceptual standards even if it is primary an implementation standards and if it addresses also discovery and evaluation requirements

## D.3 Metadata applications

### D.3.1 Interchange models

ISO 19109 defines two **interchange models**:

- In the traditional **data transfer model**, the data supplier creates a dataset that is transferred to the user. The structure and the content of data are described in the application schema for the dataset. The dataset is sent in a transfer format.
- In the **interoperability model**, the user application communicates with the supplier application through a common communication protocol. In this scenario, the user invokes services that result in data being passed from the service provider to the user application. The application schema describes not only the structure and content of the exchanged data but also the structure of the interfaces involved in the transaction.

The key issue in the traditional data transfer models is the organisation of the datasets. It is generally as complex as the potential uses that the provider envisioned (while the users generally do not find in the dataset all the expected information). A well defined structure of the dataset is necessary to help the interpretation of the dataset by the user applications. The aspects of organisation of the datasets are generally twofold:

- the structure of the dataset is its organisation in spatial datasets and aggregation of spatial datasets, as well as their interrelation with their metadata entity sets and related information (feature catalogues, portrayal catalogues, ...);
- the content of the dataset is defined by the conceptual schemas defined by the standards described in D.2 and the definition of its feature types which is potentially documented in the feature catalogues.

These two organisational aspects are detailed respectively in D.3.2 and D.3.3.

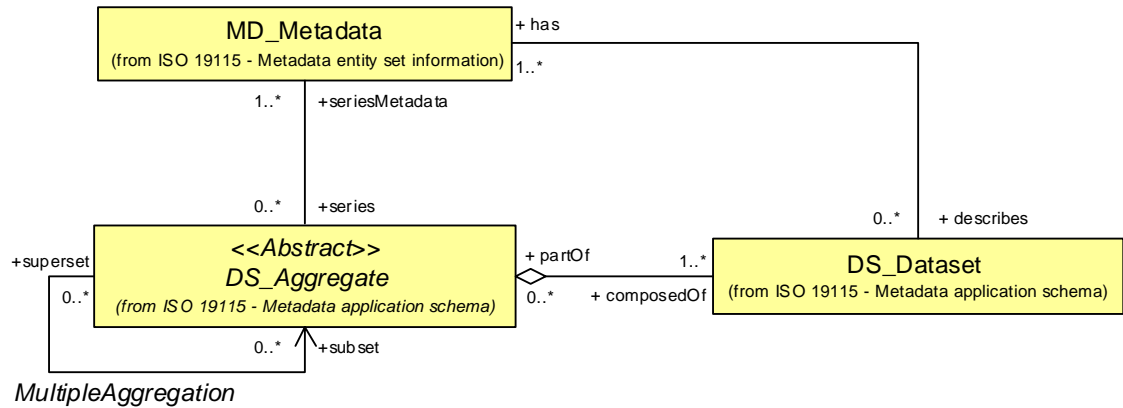

In the interoperability model the structure of the exchanged data is generally deeply reduced to a minimum hiding the underlying structure of the spatial data managed in the repository to which the services provide access. So the focus is, on one hand on the exchanged data content with a lot of similarity with the transfer model (see D.3.3), and on the other hand on the structure of the interfaces.

### D.3.2 Data Structure Application schema

Figure 3 of **ISO 19115** is a UML class diagram defining the classes of geographic information to which metadata applies. More particularly, it specifies that:

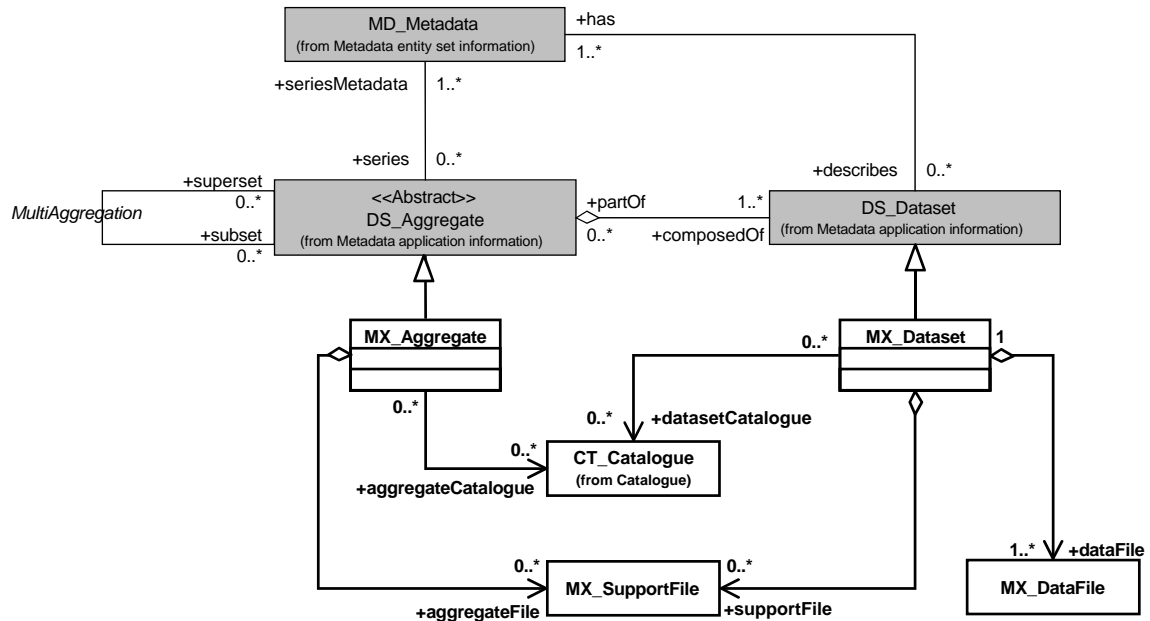

- a spatial dataset (DS\_DataSet) must have one or more related metadata entity sets (MD\_Metadata).
- a spatial dataset aggregates (DS\_Aggregate) is composed of one or more datasets and can be a superset or a subset of other spatial dataset aggregates. A dataset aggregate must have one or more related Metadata entity sets.

This base data structure application schema is illustrated in Figure D.2.

**Figure D.2 – Base application schema for spatial datasets and aggregates**

ISO/TS 19139 goes a bit further by defining a Standard Transfer Interchange Structure presented in Figure D.3.

**Figure D.3 – Standard Transfer Interchange Structure**

The transfer dataset (MX\_Dataset) data is organised in data files (MX\_DataFile). Both transfer datasets and aggregates may be accompanied by support files (MX\_SupportFile) which may contain resources needed to exploit them or complementary information. The data files and the support files are described in section 7.4.3 of ISO/TS 19139.

In practice, the information needed to exploit a spatial dataset or an aggregate is not limited to their metadata. Particularly:

- the metadata cites the feature and portrayal catalogues but does not embed them;
- the metadata instances reference information such as codelists, unit of measures and coordinate reference systems that all need to be accessed.

All of those resources may be managed externally in on-line registries, but it is usually necessary, in the context of interchange by transfer, to be able to provide that information within the transfer datasets and transfer aggregates. The abstract concept of catalogue (CT\_Catalogue) corresponds exactly to those resources needed to exploit the datasets, aggregates and their metadata. This concept is more deeply detailed in D.3.3.

### D.3.3 Data Content Application schema

ISO 19109 defines a **General Feature Model** that defines how metadata and quality elements relate to geographic features. This interrelation is considered more widely in the overall context of the specification Implementing Rules and is not discussed hereafter.

The concept of catalogue introduced in D.3.2 is detailed in section 7.4.4 of **ISO/TS 19139** which also proposes three concrete subtypes:

- CRS catalogue (CT\_CrsCatalogue) contains the description of the Coordinate Reference Systems used in the transfer dataset or transfer aggregate as well as the description of their components (datum, coordinate system, etc.);
- An UoM catalogue (CT\_UomCatalogue) contains the description of the Units of Measure used in the transfer dataset or transfer aggregate.
- A codelist catalogue (CT\_CodelistCatalogue) contains the description of the codelists used in the transfer dataset or transfer aggregate, including their name, definition as well as the description of their values;

The abstract concept of catalogue has also been defined as the basis for harmonisation of the different ISO 19100 series catalogue concepts, such as PF\_PortrayalCatalogue (ISO 19117) and FC\_FeatureCatalogue (ISO 19110). It is potentially the root concept of any set of information related to spatial resources (e.g., quality measures, ...).

The abstract concept of catalogue has been defined in the specific context of data interchange by transfer, but it is also applicable more widely to interchange by transaction either through a general access services to catalogues or through access services dedicated to each of the individual types of catalogues (portrayal, feature, ...).

## D.4 The Implementation Standards

### D.4.1 Overview

The INSPIRE Metadata Use Case implies the existence of a range of repositories which have to be managed by the managers and accessed by the users. A repository can be implemented within a registry as a set of registers. This should conform to **ISO 19135** in order to ease the management of the repository content, but the main concern of these Implementing Rules is the way the content of the repository can be accessed.

First, concepts described in D.2 and more generally the concepts expressed in the application schema have to be formatted, preferably using a standard encoding (see D.4.2). The encoded data can then be stored on local or remote locations or be accessed via services. Standard service specifications are described in D.4.3.

### D.4.2 Standard encoding

**ISO/TS 19139** defines a set of encoding rules which can generally be applied to any of the spatial conceptual standards. It proposes an XML Schema Implementation of **ISO 19115** and the parts of the conceptual foundation standards involved when implementing **ISO 19115**. CSW2 AP ISO proposes an XML Schema Implementation of **ISO 19119** based on **ISO/TS 19139** encoding rules. **ISO/TS 19139** also propose a standard encoding of CRS catalogues, Catalogues of Unit of Measures and code list catalogues.

These **ISO/TS 19139** based XML Schema implementations are applicable to interchanges of metadata and related information by transfer. They are also applicable more generally for a local or remote storage of the information when they are not accessed via a standard service. It is also recommended that XML Schemas implementation based on **ISO/TS 19139** encoding rules should be adopted when no standard XML Schema Implementation are available. A standard XML Schema implementation is expected through an amendment of **ISO 19110**, but there are already some valid XML Schema Implementations of **ISO 19110** available.

For interchanges by transmission, the implementation of the service interface is generally part of the service specification.

### D.4.3 Standard service specifications

**CSW 2.0** is the reference service specification for discovery, evaluation and use. It proposes an XML encoding based on a profile of Dublin Core which is suitable for discovery. More generally, a service compliant to the base **CSW 2.0** will address discovery requirements. It is necessary to use **CSW 2.0** application profiles to go further:

- CSW2 AP ISO is an ISO 19115/ISO 19139 application profile of **CSW 2.0**. It is based on an **ISO/TS 19139** compliant encoding of ISO 19115 and ISO 19119. It addresses evaluation requirements and it is applicable in this context.
- OGC is working on an application profile of **CSW 2.0** for accessing the content of on-line registers.
- OGC is also working on an application profile of **CSW 2.0** based on the ebRIM Standard of the OASIS Consortium.

These two last application profiles are not mature enough to be recommended. There are also some on-going work within OGC to define a way to access any kind of data through WFS.

## D.5 Other applicable standards

### D.5.1 Dublin Core

Dublin Core is an international initiative focusing on discovery aspect of metadata for information. The initiative has gained a broad cross-sectoral support and Dublin Core Metadata Element Set have been published in 2003 as the ISO 15836 standard.

The wide use of Dublin Core does not limit the importance of sector-specific metadata standards such as ISO 19115. Metadata repositories of spatial resources are generally not set up to address discovery only requirements and Dublin Core metadata elements will not satisfy the wide range of requirements covered by the INSPIRE Metadata Use Case.

Yet, the interface between the INSPIRE community and the overall European Community has to be considered. The PSI Directive applies to spatial information and it is important not to duplicate the existing effort for documenting public resources. These Implementing Rules define in Annex B specific rules for expressing an INSPIRE Profile of Dublin Core called the INSPIRE Core. The INSPIRE Core ensures a common Dublin Core expression of metadata for spatial resources.

This INSPIRE Core is compatible with the OGC Core defined in **CSW 2.0** and these Implementing Rules adopt the XML encoding of the OGC Core has defined in **CSW 2.0**. The availability of a **CSW 2.0** service delivering the content of a repository of metadata for spatial resources in OGC Core is not required, but it may be implied by the PSI Directive.

### D.5.2 Other ISO standards

Different ISO standards are applicable in the conditions defined by ISO 19115, typically:

- **ISO 639-2** three letter codes for the expression of languages;

**ISO/IEC 2382-1:1993, Information technology – Vocabulary – Part 1: Fundamental terms**

- **ISO 8601** for the expression of date and times.

## Annex E Mapping of the INSPIRE spatial data themes to code list B.5.27 of ISO 19115

In principle, all INSPIRE spatial data themes can be mapped to code list B.5.27 of ISO 19115. Table E.1 suggests a mapping between the ISO 19115 topic categories and the INSPIRE spatial data themes.

It should be noted that the INSPIRE spatial data themes may change in title and definition over time.

This mapping is based on the proposal for the INSPIRE directive 10553/05 of 29 June 2005, Brussels.

The annexes mentioned in Table E.1 refer to those in the proposal for the INSPIRE directive.

**Table E.1 - Mapping of the INSPIRE spatial data themes**

	Name (ISO 19115)	INSPIRE spatial data themes	Domain code	Definition
1.	MD_TopicCategoryCode	From Annex I, II and III	TopicCatCd	high-level geographic data thematic classification to assist in the grouping and search of available geographic data sets. Can be used to group keywords as well. Listed examples are not exhaustive. NOTE It is understood there are overlaps between general categories and the user is encouraged to select the one most appropriate.
2.	Farming	- Agricultural and aquaculture facilities (III.9)	001	rearing of animals and/or cultivation of plants  Examples: agriculture, irrigation, aquaculture, plantations, herding, pests and diseases affecting crops and livestock
3.	Biota	- Bio-geographical regions (III.17) - Habitats and biotopes (III.18) - Species distribution (III.19)	002	flora and/or fauna in natural environment  Examples: wildlife, vegetation, biological sciences, ecology, wilderness, sea life, wetlands, habitat
4.	boundaries	- Administrative units (I.4) - Statistical units (III.1)	003	legal land descriptions  Examples: political and administrative boundaries
5.	ClimatologyMeteorologyAtmosphere	- Atmospheric conditions (III.13) - Meteorological geographical features (III.14)	004	processes and phenomena of the atmosphere  Examples: cloud cover, weather, climate, atmospheric conditions, climate change, precipitation
6.	Economy	- Energy resources (III.20) - Mineral resources (III.21)	005	economic activities, conditions and employment  Examples: production, labour, revenue, commerce, industry, tourism and ecotourism, forestry, fisheries, commercial or subsistence hunting, exploration and exploitation of resources such as minerals, oil and gas
7.	Elevation	- Elevation (II.1)	006	height above or below sea level  Examples: altitude, bathymetry, digital elevation models, slope, derived products
8.	Environment	- Protected sites (I.9)	007	environmental resources, protection and conservation  Examples: environmental pollution, waste storage and treatment, environmental impact assessment, monitoring environmental risk, nature reserves, landscape
9.	GeoscientificInformation	- Soil (III.3) - Geology (II.4) - Natural risk zones (III.12)	008	information pertaining to earth sciences  Examples: geophysical features and processes, geology, minerals, sciences dealing with the composition, structure and origin of the earth's rocks, risks of earthquakes, volcanic activity, landslides, gravity information, soils, permafrost, hydrogeology, erosion

	Name (ISO 19115)	INSPIRE spatial data themes	Domain code	Definition
10.	Health	- Human health and safety (III.5)	009	health, health services, human ecology, and safety  Examples: disease and illness, factors affecting health, hygiene, substance abuse, mental and physical health, health services
11.	ImageryBaseMapsEarthCover	- Orthoimagery (II.3) - Land cover (II.2)	010	base maps  Examples: land cover, topographic maps, imagery, unclassified images, annotations
12.	intelligenceMilitary		011	military bases, structures, activities  Examples: barracks, training grounds, military transportation, information collection
13.	inlandWaters	- Hydrography (I.8)	012	inland water features, drainage systems and their characteristics  Examples: rivers and glaciers, salt lakes, water utilization plans, dams, currents, floods, water quality, hydrographic charts
14.	location	- Geographical names (I.3) - Addresses (I.5)	013	positional information and services  Examples: addresses, geodetic networks, control points, postal zones and services, place names
15.	oceans	- Sea regions (III.16) - Oceanographic geographical features (III.15)	014	features and characteristics of salt water bodies (excluding inland waters)  Examples: tides, tidal waves, coastal information, reefs
16.	planningCadastre	- Cadastral parcels (I.6) - Land use (III.4) - Area management/ restriction/regulation zones & reporting units (III.11)	015	information used for appropriate actions for future use of the land  Examples: land use maps, zoning maps, cadastral surveys, land ownership
17.	society	- Population distribution – demography (III.10)	016	characteristics of society and cultures  Examples: settlements, anthropology, archaeology, education, traditional beliefs, manners and customs, demographic data, recreational areas and activities, social impact assessments, crime and justice, census information
18.	structure	- Buildings (III.2) - Production and industrial facilities (III.8) - Environmental monitoring facilities (III.7)	017	man-made construction  Examples: buildings, museums, churches, factories, housing, monuments, shops, towers
19.	transportation	- Transport networks (I.7)	018	means and aids for conveying persons and/or goods  Examples: roads, airports/airstrips, shipping routes, tunnels, nautical charts, vehicle or vessel location, aeronautical charts, railways
20.	utilitiesCommunication	- Utility and governmental services (III.6)	019	energy, water and waste systems and communications infrastructure and services  Examples: hydroelectricity, geothermal, solar and nuclear sources of energy, water purification and distribution, sewage collection and disposal, electricity and gas distribution, data communication, telecommunication, radio, communication networks

NOTE The INSPIRE spatial themes “Coordinate reference systems (I.1)” and “Geographical grid systems (I.2)” are not mapped with the ISO dataset topic category. From the topic category viewpoint these INSPIRE spatial themes are not themes because there is no thematic classification, and both can be considered as reference systems.

## **Annex F      The conformity of spatial resources with the implementing rules referred to in Article 7(1); (Art. 5-2 (a) and Art. 11-2 (d))**

The way in which conformity is expressed in the INSPIRE IR will be defined in a subsequent draft based on discussions being held with the Drafting Team on Data specifications and harmonization.

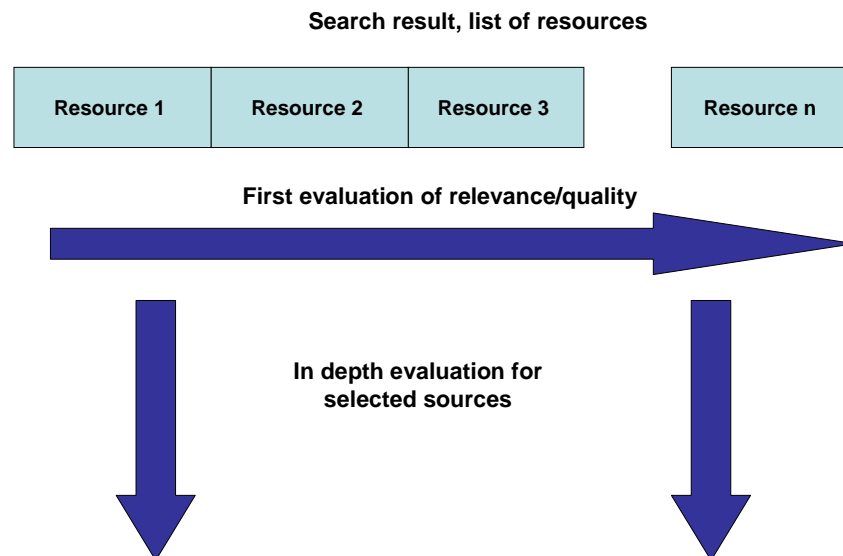

## Annex G Quality and validity of spatial resources; (Art. 5-2 (c))

In the INSPIRE Directive Art. 5-2 (c) and 11-2(c) there is a requirement for information about the quality and validity of a resource. This annex describes how this requirement is interpreted and the confrontation of this interpretation with the discovery set.

The following description will illustrate the relation and connection between the discovery set of metadata elements and the process of a rough data quality evaluation of environmental data resources from the user perspective.

The term quality is used from a user perspective and is described as a first estimate of whether or not a resource is relevant or usable for a specific problem. That means that quality and validity of a resource are not used in the context of ISO 19113 Geographic information – Quality principles and ISO 19114 Geographic information – Quality evaluation procedures.

From user perspective the first estimation of quality of an environmental resource is the usefulness for a specific purpose and includes aspects of validity. The validity of a resource depends on the actual problem or question. The quality in terms of validity is defined by the actual situation and can not be given by a detailed description in advance. The usefulness of a resource for a specific purpose is based on 'quality indicators' which give the user the ability to assess the resource according to the user's actual situation defined by time, budget, available resources etc Therefore in general a user will evaluate the relevance and usability of a resource on metadata elements delivered by discovery service as a search result. Metadata information is used as 'quality indication'. This is a specific user action and the focus and weighting of metadata will vary between the resources and will depend on the problem.

**Figure G.1 The two main user actions to evaluate resources**

Figure G.1 illustrates the two main processes of quality evaluation. It illustrates, that the first evaluation is based on the list of results from a search and an in depth analysis will be done in a second step for specific resources.

In table G.1 an impression is given of the connection between user actions, the first quality assessment and the relevant metadata elements. The general use case describes the situation that for actual question or problem the availability of additional environmental, georeferenced information has to be checked. The initial and most important issue is to find any available resource through one metadata search. The expectation from a user perspective is to get a list of resources. Search criteria will be chosen in most cases as wide as possible to cover all possible resources. In case of too many hits the criteria will be more specific in a second step. The availability of metadata is set as given for the use case and is core for the following steps.

From a user perspective the display of relevant information for each resource in a clear structured way where the user can recognise immediately the relevant information is the most important aspect.

**Table G.1: schematic procedure of resource evaluation**

User action	Expected System response	Evaluation of relevance/quality by user	Requirements for metadata content	Metadata elements
Searching for resources in a specific thematic and geographical context	List of resources with rough categorisation; list includes a ranking		Support discovery service for semantic and spatial context	Resource title Resource topic category Keywords
Going over the list of results	Short summary of each resource is listed	Listed sources have a connection to the thematic area and to the geographic extent of search		
Looking for availability	Text item with description of access and use restrictions	Is the resource accessible to me and (if any) what cost are connected to use the source (licence)?	The information is up to date and valid; contact information is available <i>Clear categories of access and use restrictions</i>	Constraints – Access Constraints – use limitations
Looking for thematic relevance	Text description for the thematic content	Is the resource thematic relevant? Can I as user (in most cases not an expert in the specific field) understand the description? Is the description detailed enough? Alternatively, can I reject this resource as unsuitable on the basis of the description?	Text document (ideally structured and easy to read) with understandable description for non experts and links to more detailed information for interested or experts <i>content definition clear; target group clear; ideally examples for administration</i>	Resource topic category Keywords Abstract

User action	Expected System response	Evaluation of relevance/quality by user	Requirements for metadata content	Metadata elements
Looking for timeliness	Information about the currency of the information	Is the resource useable in terms of its currency? Is this the most recent version of the information available. Is there a more relevant past version of the data (for example different publication dates)? Can I restrict the temporal extent of the data?	Text description of currency is given or the temporal period covered by the data, information is according to content	Date – temporal reference
Looking for relevance on spatial context	Visualisation of the graphical extent of the resource (ideally in combination with my search criteria)	Is the spatial relation between resource and area of interest sufficient (full coverage, most relevant part, only a small part...)?	Definition of the geographic extent of the resource	Geographic extent of the resource - EX_GeographicBoundingBox Geographic extent of the resource - EX_GeographicDescription
Looking for equivalent scale, spatial resolution	Information of spatial resolution, equivalent scale	Is the resource usable in terms of equivalent scale or resolution distance 1X1km grid, 1:25000)?	Rough categorisation of either equivalent scale or resolution distance	Equivalent scale Resolution distance
Lineage	Description of the 'history' of a resource in a text document	Are there any methods or sources used, which restrict the use for my specific requirements?	Description of use methods and used sources (like elevation models, ...) <i>content definition clear; target group clear; ideally examples for administration (when to use a link)</i>	Lineage
evaluating a specific source in detail	Contact information and other links to additional information is listed	Is there an address, phone number mail address to ask for more detailed information and clarification?	Actual contact information	Resource responsible party Resource locator

The columns 'user action' and 'expected system response' should give a rough indication of the process. The column 'Evaluation of relevance/quality' describes the interpretation/estimation from user side of metadata content. 'Requirements for metadata' contains a rough description of what is important in metadata description. And the column 'metadata element' gives the link to the used element of description.

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 81 of 104

The steps following the initial search are schematically described. The importance of single aspects can vary in a concrete case and will also depend on the number of possible available resources. In most cases there will be for the time being not too many results if the search is either thematically or geographical very specific. But assuming that implementing INSPIRE a much higher number of resources will be described and available for search the more important will this kind of 'pre-selection' be for any user in the field of environmental data and information.

For the evaluation process of available resources the schematic procedure shows, that the most important aspect is the availability and completeness of metadata description. As more detailed the question is as higher is the probability that no information is available. For all cost free spatial information the key question is "Can I combine the different resources with my tools?". For all use restricted resources especially if they are connected to costs the cost benefit evaluation is the most important aspect.

To have consistent results and a full usability of metadata the common understanding of metadata description and a minimum of mandatory core elements are crucial. The use case provides a view from a user perspective why these elements are so important and what is the risk if there is no common understanding or different definition and structuring is used for metadata.

## Annex H Guidelines for ISO/TS 19139 Metadata - Implementation specification

### *H.1 From the conceptual schema to XML File instances*

Due to the use envisioned for the geographic metadata XML Schema, it is fundamental to keep the organisation of the data, its associated metadata and the related information in very flexible files. It is very important to understand that the MD\_Metadata XML element will rarely be the root element of an XML File, but depending on the context it may appear one or many times in a single XML File describing one or many different types of resources.

### *H.2 Polymorphism*

It is even possible to have an XML file containing a metadata set without containing a single MD\_Metadata XML element. This is a consequence of the polymorphism, which may imply that an XML element representing a subclass of MD\_Metadata, potentially defined in a user community profile, occurs instead of the MD\_Metadata XML element. This is true for MD\_Metadata as well as for any of the concepts defined in the ISO 19100 series of International Standards.

### *H.3 Management of polymorphism*

#### **H.3.1 Management of community extensions**

In order to ensure the understanding of user profiled metadata sets, a specific requirement has been expressed in A.3 of ISO 19139. The XML element of any new metadata element has to support a mandatory XML attribute called isoType that is expected to contain the name of the ISO class it derives from directly or indirectly.

```
<MY_Metadata gco:isotype="MD_Metadata">
  <!-- Standard properties not detailed here -->
  <myProperty>
    <gco:CharacterString>Whatever text</gco:CharacterString>
  </myProperty>
</MY_Metadata>
```

#### **H.3.2 Parsing of metadata files**

To accommodate the polymorphism of the data types, parsing of the metadata files has to be driven by the XML elements corresponding to the properties of the UML models (rather look for the metadata elements named identificationInfo, than the metadata elements named MD\_DataIdentification or SV\_ServiceIdentification). The elements corresponding to the data type can generally be skipped.

When it is necessary to evaluate the XML element representing data types (e.g., because the application needs to consider the data identification info, but not the service identification info), it is important to look for the XML element corresponding to the expected ISO data type (e.g., gco:MD\_DataIdentification) or the XML element for which the value of gco:isotype is the expected data type (e.g. MD\_DataIdentification). There is no namespace indication in the value of the isoType attribute.

## H.4 Management of by reference containment

Any instance of a UML property can be implemented:

- by value, i.e. the instance of its datatype is a subelement of the property instance;
 

```
<gmx:MX_Aggregate>
  <gmd:composedOf>
    <gmx:MX_Dataset>
      ...
    </gmx:MX_Dataset>
  </gmd:composedOf>
  <gmd:seriesMetadata> ... </gmd:seriesMetadata>
</gmx:MX_Aggregate>
```
- by reference, i.e. the property instance handles a xlink:href attribute which value is a reference (typically URL) to the instance of its datatype. In this case, the instance of the datatype handles an id XML attribute serving as an identifier.

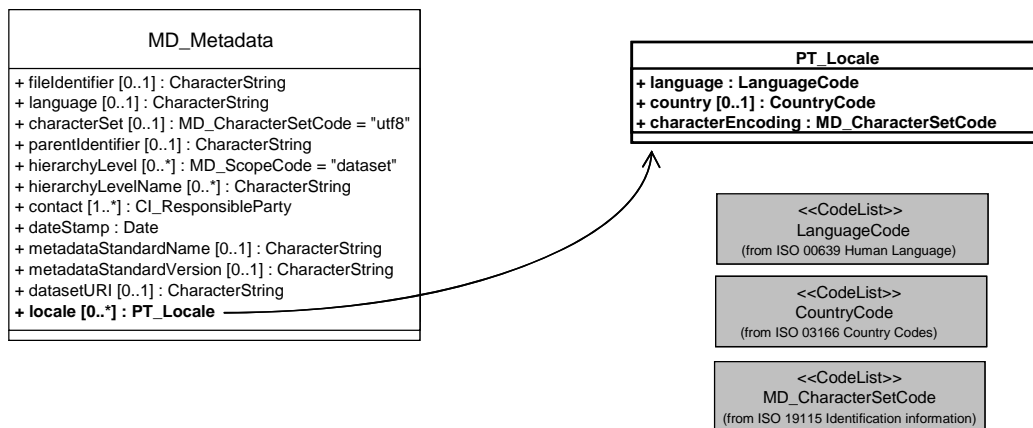

```
<gmx: MX_Aggregate>
  <gmd:composedOf xlink:href="product1.xml">
    <gmd:seriesMetadata> ... </gmd:seriesMetadata>
</gmx:MX_Aggregate>
```

The use of by reference containment is of course a very good way to ensure the consistency of the XML data and to reduce the maintenance cost. However it complicates the parsing of the XML file. It is recommended that the parser use a generic mechanism to manage the by-reference containment.

## H.5 ISO 19139 and multilingual metadata

Per corrigendum, an optional but repeatable attribute locale has been added to the class MD\_Metadata. Two cases of to be considered:

- When this attributes is not implemented, the metadata set is expected to be monolingual: the language of the metadata is defined by the language attribute of MD\_Metadata.
- When this attribute is implemented, each instance represents a locale (language, country and character encoding) in which the metadata elements may be translated. The language attribute still defines the default language of the metadata, i.e. the language in which all the metadata elements are expressed. Then each metadata element can be translated in some of the locales define for the metadata set.

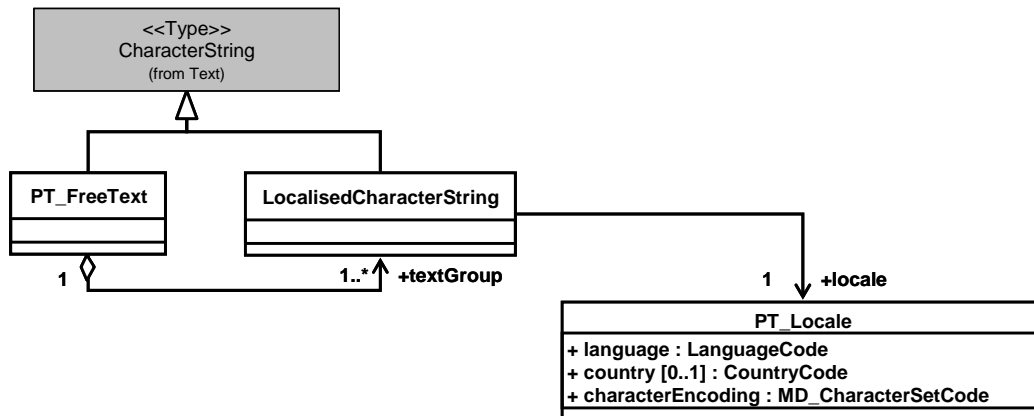

The metadata elements which may require translations are those of type CharacterString having a free text domain.

Name / Role name	Short Name	Definition	Obligation / Condition	Maximum occurrences	Data type	Domain	
1	MD_Metadata	Metadata	root entity which defines metadata about a resource or resources	M	1	Class	Lines 2-22
2	fileIdentifier	mdFileID	unique identifier for this metadata file	O	1	CharacterString	Free text

Data type	Domain
Class	Lines 2-22
CharacterString	Free text

Support of free text is enabled via a subtype of CharacterString called PT\_FreeText which aggregates a set of localised character strings through its textGroup property. Each localised character string provides a translation of the character string in the related locale.

The following clauses define the way multilingual metadata are implemented.

### H.5.1 The default language

The default language of a metadata set is defined by the language property of MD\_Metadata while the characterSet property defines the corresponding character encoding. Here is a sample instance of the class MD\_Metadata illustrating the use of both properties.

```

<MD_Metadata>
  <!-- portions of metadata not shown -->
  <language>
    <LanguageCode
      codeList="resources/Codelist/gmxcodelists.xml#LanguageCode"
      codeListValue="eng"> English </LanguageCode>
    </language>
  <characterSet>
    <MD_CharacterSetCode
      codeList="resources/Codelist/gmxcodelists.xml#MD_CharacterSetCode"
      codeListValue="utf8"> UTF-8 </MD_CharacterSetCode>
    </characterSet>
  <!-- portions of metadata not shown -->
</MD_Metadata>
  
```

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 85 of 104

## H.5.2 Alternate languages

Each metadata alternate language of the metadata is defined through the locale property of MD\_Metadata. In the following example, some of these metadata are translated into French:

```
<MD_Metadata>
  <!-- portions of metadata not shown, particularly the language and
        characterSet properties which are not detailed -->
  <locale>
    <PT_Locale id="locale-fr">
      <languageCode>
        <LanguageCode
          codeList="resources/Codelist/gmxcodelists.xml#LanguageCode"
          codeListValue="fra"> French </LanguageCode>
        </languageCode>
      <characterEncoding>
        <MD_CharacterSetCode
          codeList="resources/Codelist/gmxcodelists.xml#MD_CharacterSetCode"
          codeListValue="utf8">UTF 8</MD_CharacterSetCode>
        </characterEncoding>
      </PT_Locale>
    </locale>
  <!-- portions of metadata not shown -->
</MD_Metadata>
```

## H.5.3 Embedded translations

Any metadata element having a free text domain (e.g. the abstract property of MD\_DataIdentification) can then be instantiated like this:

```
<abstract xsi:type="PT_FreeText_PropertyType">
  <gco:CharacterString>Brief narrative summary of the content of the
resource</gco:CharacterString>
  <!--== Alternative value ==-->
  <PT_FreeText>
    <textGroup>
      <LocalisedCharacterString locale="#locale-fr">Résumé succinct du
contenu de la ressource</LocalisedCharacterString>
    </textGroup>
  </PT_FreeText>
</abstract>
```

The xsi:type attribute indicates that this instance of the abstract property is not instantiated through a simple CharacterString, but rather as a free text. As a consequence, the element contains a complementary PT\_FreeText subelement containing one or more textGroup elements (one per translation).

## H.5.4 Use of translation files

In the preceding example, the definition of the locale property is provided by value which implies that the translations are embedded with default language metadata. It is also possible to store the translations corresponding to a given language into a translation file using the **PT\_LocaleContainer** class. In such case, it is easier to define the locale within the translation file (e.g. fr-fr.xml) and to express the instance of the MD\_Metadata locale property by reference.

```
<gmd:locale xlink:href="./fr-fr.xml#locale-fr"/>
```

The content of the fr-fr.xml file would look like this:

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 86 of 104

```

<PT_LocaleContainer>
  <!-- portions of metadata not shown -->
  <locale>
    <PT_Locale id="locale-fr">
      <languageCode>
        <LanguageCode
          codeList="resources/Codelist/gmxcodelists.xml#LanguageCode "
          codeListValue="fra"> French </LanguageCode>
        </languageCode>
      <characterEncoding>
        <MD_CharacterSetCode
          codeList="./Codelist/ML_gmxCodelists.xml#MD_CharacterSetCode"
          codeListValue="utf8">UTF 8</MD_CharacterSetCode>
        </characterEncoding>
      </PT_Locale>
    </locale>
    <!-- portions of metadata not shown -->
    <localisedString>
      <LocalisedCharacterString locale="#locale-fr" id="#abstract-fr">
Résumé succinct du contenu de la ressource</LocalisedCharacterString>
    </localisedString>
    <!-- portions of metadata not shown -->
  </PT_LocaleContainer>

```

The multilingual instance of the abstract property now implements the translation by reference to the translation file:

```

<abstract xsi:type="PT_FreeText_PropertyType">
  <gco:CharacterString>Brief narrative summary of the content of the
  resource</gco:CharacterString>
  <!--== Alternative value ==-->
  <PT_FreeText>
    <textGroup xlink:href="fr-fr.xml#abstract-fr"/>
  </PT_FreeText>
</abstract>

```

## H.6 Contexts of use

### H.6.1 Use of ISO 19139 in the context of a Catalogue Service

When the data being passed through a cataloguing service is XML encoded, the catalogue service interface defines the different XML Schemas to be used as a response to the user queries. When the geographic metadata XML Schema is used, there should be one or many MD\_Metadata instances in the returned XML File.

### H.6.2 Use of ISO 19139 in the context of the standard interchange by transfer

The transfer aggregate and transfer dataset concepts are the two major components of an interchange by transfer. There may be one or many XML Files composing the interchange, but the root element of at least one of the files is an XML instance of MX\_Dataset, MX\_Aggregate or one of their extensions. From such an element, the parsing of the interchange is model driven and it follows the principles described in 7.4 of ISO 19139. See ISO 19139 for details about MX\_Dataset and MX\_Aggregate.

## H.7 Character encoding

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 87 of 104

As defined in MD\_Metadata.characterEncoding and MD\_Metadata.locale. Preferably UTF-8 if the XML files contains multilingual metadata.

## H.8 Temporal extent encoding

In ISO 19115, temporal extents are of type TM\_Primitive (abstract type from ISO 19108). In ISO 19139, this type (and its sub-types) are mapped to ISO 19136 temporal types and W3C built-in types. In the INSPIRE Discovery Metadata Element Set, the concrete TM\_Period subtype of TM\_Primitive is used as type for the XML element temporalExtent. It is implemented as type TimePeriod from ISO 19136.

TimePeriod offers three options to express a time interval:

- Use two TimePosition elements for beginPosition and endPosition. Date and time information is contained inline and cannot be referenced from another XML Element. Only the TimePeriod element can, through its gml:id.

```
<?xml version="1 0" encoding="UTF-8"?>
<gmd:MD_Metadata>
<!-- Portions of metadata not shown -->
<gmd:extent>
  <gmd:EX_Extent>
    <gmd:temporalElement>
      <gmd:EX_TemporalExtent>
        <gmd:extent>
          <gml:TimePeriod gml:id="extent">
            <gml:beginPosition>1977-03-10T11:45:30</gml:beginPosition>
            <gml:endPosition>2005-01-15T09:10:00</gml:endPosition>
          </gml:TimePeriod>
        </gmd:extent>
      </gmd:EX_TemporalExtent>
    </gmd:temporalElement>
  </gmd:EX_Extent>
</gmd:extent>
<!-- Portions of metadata not shown -->
</gmd:MD_Metadata>
```

- Use two TimeInstant elements: Date and time information is here contained by reference and the TimeInstant elements can be re-used through a reference from another XML element in the XML file. The TimePeriod element can also be re-used.

```
<?xml version="1.0" encoding="UTF-8"?>
<gmd:MD_Metadata>
<!-- Portions of metadata not shown -->
<gmd:extent>
  <gmd:EX_Extent>
    <gmd:temporalElement>
      .....<gmd:EX_TemporalExtent>
      .....<gmd:extent>
      .....<gml:TimePeriod gml:id="extent">
      .....<gml:begin>
      .....<gml:TimeInstant gml:id="t11">
      .....<gml:timePosition>1977-03-
10T11:45:30</gml:timePosition>
      .....</gml:TimeInstant>
      .....</gml:begin>
      .....<gml:end>
```

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 88 of 104

```

.....<gml:TimeInstant gml:id="t12">
.....<gml:timePosition>2005-01-
15T09:10:00</gml:timePosition>
.....</gml:TimeInstant>
.....</gml:end>
.....</gml:TimePeriod>
.....</gmd:extent>
.....</gmd:EX_TemporalExtent>
.....</gmd:temporalElement>
...</gmd:EX_Extent>
</gmd:extent>
<!-- Portions of metadata not shown -->
</gmd:MD_Metadata>

```

- The two previous methods can be used in combination: one TimePeriod limit can be expressed as a TimePosition and the other as a TimeInstant:

```

<?xml version="1 0" encoding="UTF-8"?>
<gmd:MD_Metadata>
<!-- Portions of metadata not shown -->
<gmd:extent>
  <gmd:EX_Extent>
    <gmd:temporalElement>
      <gmd:EX_TemporalExtent>
        <gmd:extent>
          <gml:TimePeriod gml:id="extent">
            <gml:begin>
              <gml:TimeInstant gml:id="t11">
                <gml:timePosition>1977-03-
10T11:45:30</gml:timePosition>
              </gml:TimeInstant>
            </gml:begin>
              <gml:endPosition>2005-01-15T09:10:00</gml:endPosition>
            </gml:TimePeriod>
          </gmd:extent>
        </gmd:EX_TemporalExtent>
      </gmd:temporalElement>
    </gmd:EX_Extent>
  </gmd:extent>
  <!-- Portions of metadata not shown -->
</gmd:MD_Metadata>

```

## H.9 Spatial resolution encoding

A dataset or dataset series' spatial resolution can be expressed as an equivalent scale or as a resolution distance:

- Expression as an equivalent scale:

```

<?xml version="1.0" encoding="UTF-8"?>
<gmd:MD_Metadata>
<!-- Portions of metadata not shown -->
<gmd:identificationInfo>
<!-- Portions of metadata not shown -->
<gmd:spatialResolution>
  <gmd:MD_Resolution>
    <gmd:equivalentScale>
      <gmd:MD_RepresentativeFraction>
        <gmd:denominator>

```

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 89 of 104

```

        <gco:Integer>25000</gco:Integer>
      </gmd:denominator>
    </gmd:MD_RepresentativeFraction>
  </gmd:equivalentScale>
</gmd:MD_Resolution>
</gmd:spatialResolution>
<!-- Portions of metadata not shown -->
</gmd:identificationInfo>
<!-- Portions of metadata not shown -->
</gmd:MD_Metadata>

```

In this case, the spatial resolution is expressed as the denominator of the scale of a comparable hardcopy map or chart.

- Expression as a resolution distance:

```

<?xml version="1.0" encoding="UTF-8"?>
<gmd:MD_Metadata>
<!-- Portions of metadata not shown -->
<gmd:identificationInfo>
<!-- Portions of metadata not shown -->
<gmd:spatialResolution>
  <gmd:MD_Resolution>
    <gmd:distance>
      .....<gco:Distance uom="#cm">25</gco:Distance>
    </gmd:distance>
  </gmd:MD_Resolution>
</gmd:spatialResolution>
<!-- Portions of metadata not shown -->
</gmd:identificationInfo>
<!-- Portions of metadata not shown -->
</gmd:MD_Metadata>

```

In this case, the spatial resolution is expressed as the ground sample distance, implemented through the gco:Distance type. The unit of measure is either a conventional unit of measure symbol or a link to a definition. The latter case is illustrated above.

- If needed, the two options can be used in conjunction:

```

<?xml version="1 0" encoding="UTF-8"?>
<gmd:MD_Metadata>
<!-- Portions of metadata not shown -->
<gmd:identificationInfo>
<!-- Portions of metadata not shown -->
<gmd:spatialResolution>
  <gmd:MD_Resolution>
    <gmd:distance>
      <gco:Distance uom="#cm">25</gco:Distance>
    </gmd:distance>
  </gmd:MD_Resolution>
</gmd:spatialResolution>
<gmd:spatialResolution>
  <gmd:MD_Resolution>
    <gmd:equivalentScale>
      <gmd:MD_RepresentativeFraction>
        <gmd:denominator>
          <gco:Integer>25000</gco:Integer>
        </gmd:denominator>
      </gmd:MD_RepresentativeFraction>
    </gmd:equivalentScale>
  </gmd:MD_Resolution>
</gmd:spatialResolution>
<!-- Portions of metadata not shown -->
</gmd:identificationInfo>
<!-- Portions of metadata not shown -->
</gmd:MD_Metadata>

```

Infrastructure for Spatial Information in Europe		Reference: draftINSPIREMetadataRv2_20070202.doc	
DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 90 of 104

```

</gmd:equivalentScale>
</gmd:MD_Resolution>
</gmd:spatialResolution>
<!-- Portions of metadata not shown -->
</gmd:identificationInfo>
<!-- Portions of metadata not shown -->
</gmd:MD_Metadata>

```

NB: The property spatialResolution needs to be instantiated twice.

## H.10 Example of ISO 19139 XML Metadata Sets

The following XML instances include the mandatory INSPIRE Level 2 Discovery Metadata elements. They also include other ISO 19115 optional elements, as examples of what can be implemented in real cases.

### H.10.1 Service metadata instance

This clause is an XML Metadata instance describing a service resource.

```

<?xml version="1.0" encoding="UTF-8"?>
<gmd:MD_Metadata xmlns="http://www.isotc211.org/2005/srv"
  xmlns:gco="http://www.isotc211.org/2005/gco" xmlns:gmd="http://www.isotc211.org/2005/gmd"
  xmlns:srv="http://www.isotc211.org/2005/srv" xmlns:xlink="http://www.w3.org/1999/xlink"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.isotc211.org/2005/srv
  http://www.isotc211.org/2005/srv/srv.xsd">
  <gmd:language>
    <gmd:LanguageCode codeList="LanguageCode" codeListValue="eng">eng</gmd:LanguageCode>
  </gmd:language>

## Annex I Guidelines for Catalogue implementation

### I.1 Full text search

Full text search is a capability of a discovery service to query the repository for any character data types. In a full text search, the discovery service examines all of the words in every stored document as it tries to match search words supplied by the user. This is very useful, if the user does not want to match a specific queryable and rather wants to determine if a specific word is stored anywhere in a repository.

Almost all common search engines on the Web provide such capabilities (Google, Yahoo, etc), either by employing full text search techniques, or by just indexing a portion of the documents (Web Pages) examined by the indexing system.

Full text search capabilities are part of the implementation of the specific discovery service as this technique depends heavily on the underlying storage system (e.g. each database provides its own techniques and algorithms).

In case of OGC Catalogue services, the full text search is part of the query filter in that the specification defines an appropriate queryable to enable full text search by the user. This queryable is called 'AnyText'. The semantics of this queryable is defined as follows: "A target for full-text search of character data types in a catalogue".

In the context of this IR 'AnyText' could be understood as a virtual metadata element that is dedicated to full text searches. It is used only to express the search criteria to be applied to any metadata element for full text searches of character data types in a catalogue.

## Annex J Conformance with IR on Metadata

Metadata packages, classes, attributes and relationships will hereafter be called metadata elements.

### J.1 Conformance requirements

In order to be in conformance with the Implementing Rules for metadata, metadata shall be provided as specified in Chapter 5, 6, 7, 8 and Annexes A, B and E.

Any metadata claiming conformance with these Implementing Rules shall pass the requirements described in the abstract test suite presented in J.3.

### J.2 Obligation and condition

For the purposes of conformance testing using the abstract test suite in J.3, metadata elements shall be considered to be mandatory, conditional or optional as specified in section J.3.1.

### J.3 Test suite

The completion of this test ensures that the rules specified in these Implementing Rules have been applied. The test suite comprises of several different tests, and these tests shall be described in the following clauses.

#### J.3.1 Completeness test

a) Test Purpose: to determine conformance by the inclusion of all metadata elements that are specified with an obligation of “mandatory” or mandatory under the conditions specified.

NOTE: Many elements designated as mandatory are contained within optional elements. These elements become mandatory only when their containing element is used.

b) Test Method: a comparison between these Implementing Rules and a subject metadata set or service to be tested shall be performed to determine if all metadata defined as mandatory in chapters 6, 7 and 8 are present. A comparison test shall also be performed to determine if all metadata elements defined as conditional in chapters 6, 7 and 8 are present if the conditions set out in these Implementing Rules apply.

c) Reference: chapters 6, 7 and 8.

d) Test Type: Basic.

The following test cases apply at all levels of obligation – mandatory, conditional, and optional.

#### J.3.2 Maximum occurrence test

a) Test Purpose: to ensure each metadata element occur no more than the number of times specified in these Implementation Rules.

b) Test Method: examine a subject metadata set for the number of occurrences of each metadata element provided. The number of occurrences for each shall be compared with its “Maximum Occurrences” attribute specified in chapters 6, 7 or 8.

c) Reference: Chapters 6, 7 and 8.

d) Test Type: Basic.

#### J.3.3 Data type test

a) Test Purpose: to determine if each metadata element within a subject metadata set uses the specified data type.

b) Test Method: the value of each provided metadata element is tested to ensure its data type adheres to the data type specified.

DT Metadata	Draft Implementing Rules Metadata	2007-02-02	Page 103 of 104

c) Reference: Chapter 6, 7 and 8.

d) Test Type: Basic.

#### **J.3.4 Domain test**

a) Test Purpose: to determine if each provided metadata element within a subject metadata set falls within the specified domain.

b) Test Method: the values of each metadata element are tested to ensure they fall within the specified domain.

c) Reference: Chapters 6, 7 and 8.

d) Test Type: Basic.

#### **J.3.5 Schema test**

a) Test Purpose: to determine if a subject metadata set follows the schema specified in these Implementation Rules.

b) Test Method: test each metadata element and ensure it is contained within the specified metadata element.

c) Reference: Chapters 6, 7 and 8.

d) Test Type: Basic.

#### **J.3.5 Definitional test**

a) Test purpose: to determine if a metadata element is used rightfully according to the definition

b) Test Method: Compare the way a metadata element is used with the definition given in chapters 6, 7 and 8, in order to decide whether a metadata element is used correctly.

c) Reference: Chapters 6, 7 and 8.

d) Test Type: Basic
