# Přehled

- High throughput biology
  - Automation
  - Omics
  - Transcriptomics and high throughput transcriptomics
  - High throughput interactomics and how to read it
  - High throughput of anything
  - 1000(+1) genomes, GWAS
  - ENCODE
  - Epigenome and epitranscriptome
- Little about Systems biology
  - Omics
  - Holism and modules
  - Gene regulation in *E. coli*

### Examples of automation in human history

blacksmith

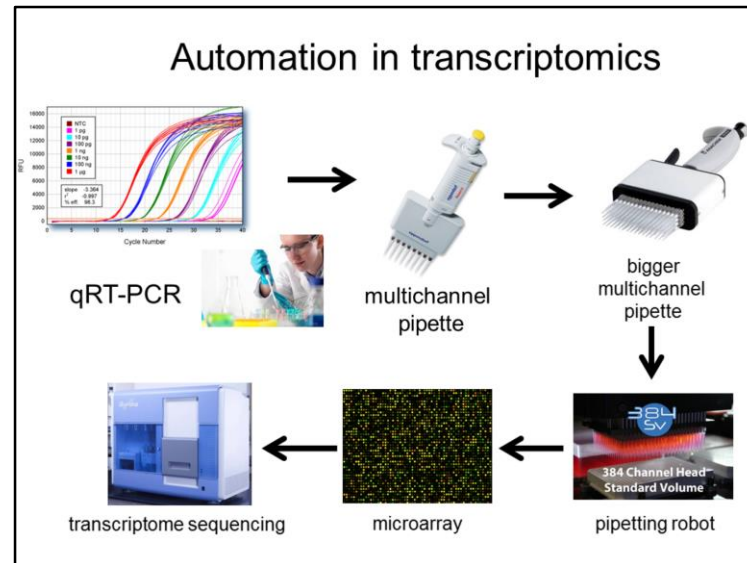

manufacture

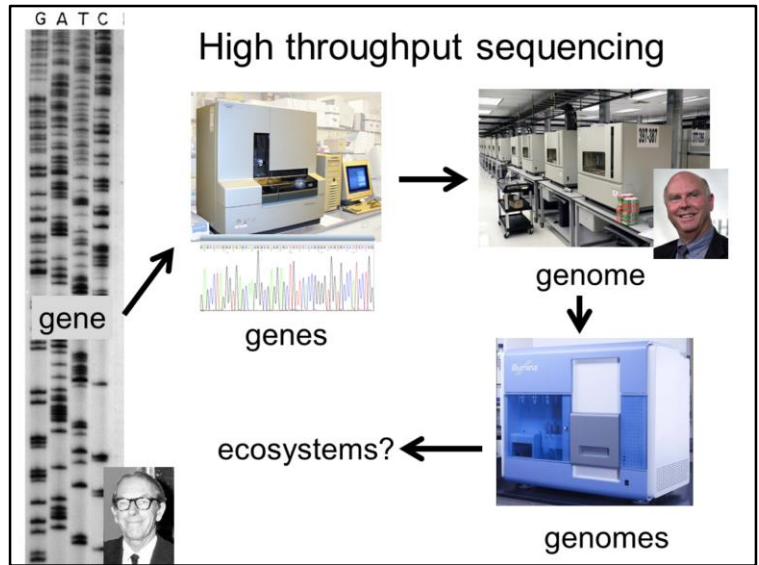

robotic automation

assembly  
line

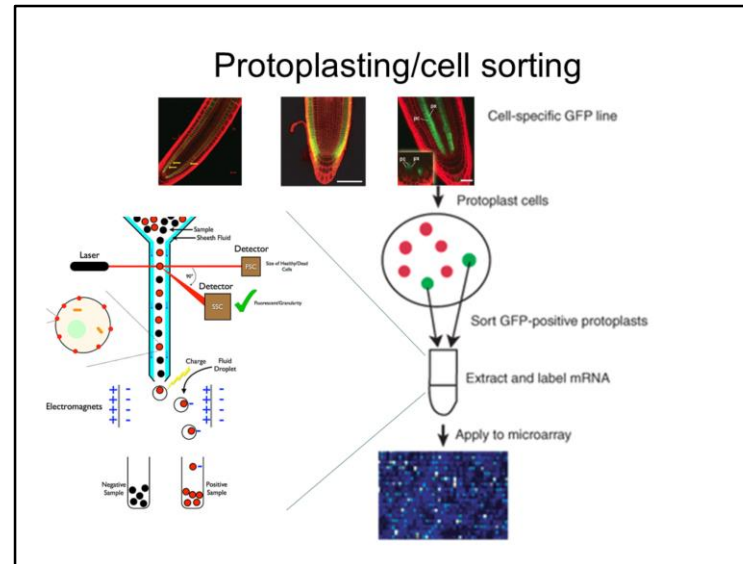

In short, the construction of single methods shown in other lecture(s) can be automatized and we can find plenty of resources online, premade. The most widely used model organism, the better.

KIAA1841 in mouse expressed in neurons

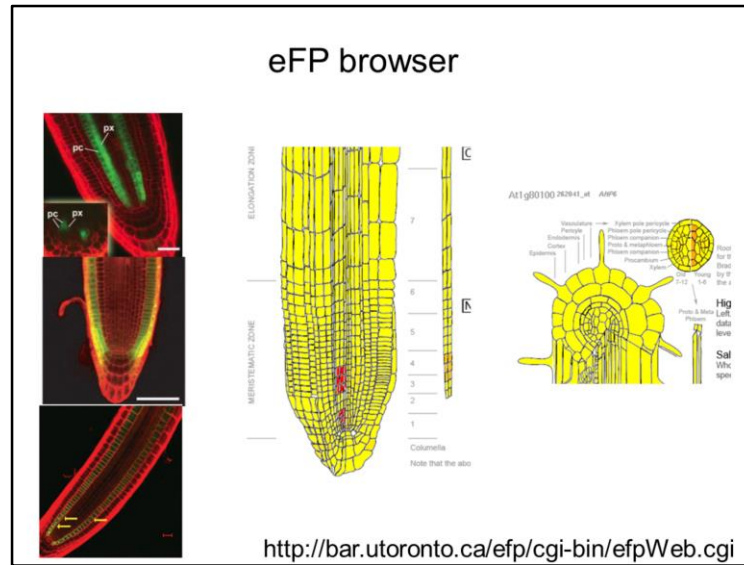

[emouseatlas.org](http://emouseatlas.org)

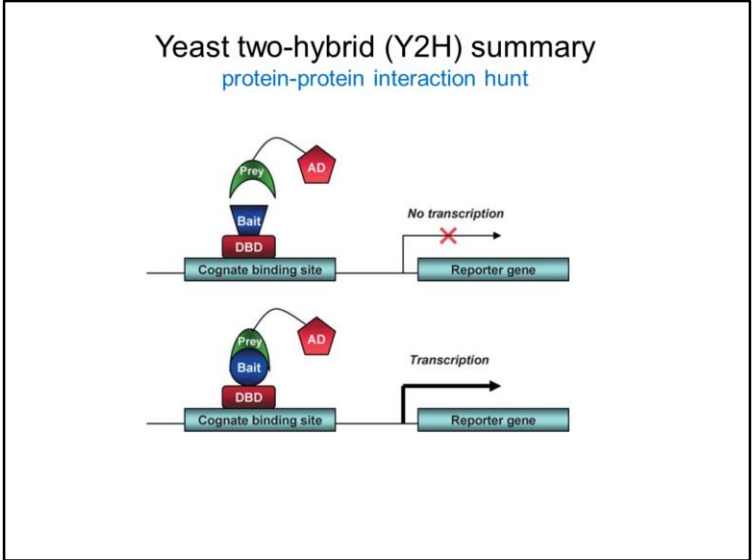

Plants have cell walls which is removed by cell wall degrading enzymes. The cell-wall free cell – protoplast – is released. If that contains fluorescently labeled signal (originating from a tissue specific marker) it can be separated by flow cytometer. From the tube of fluorescent cells collected, we can extract RNA and put to microarray or RNAseq to check the expression levels.

Some people did such experiments and one can online check the expression of one's favorite gene (unfortunately, slightly prone of artifacts).

In simple words: Y2H allows us identifying interacting partner of our favorite gene.

## T-DNA insertion at random locations in the genome

Examples of possible insertions:

You can order your mutant from  
the stock center

the same for Drosophila,  
mouse, worm etc.  
signal.salk.edu

## You can order your mutant from the stock center

What to do if you cannot find  
insertion line for your gene?

the same for Drosophila,  
mouse, worm etc.  
signal.salk.edu

- RNAi/amiRNA (can be also ordered)
- CRISPR

CRISPR – an elegant and rapidly developing technology which allows specific editing of your gene. Everybody likes CRISPR nowadays.

You can order even various constructs regarding your gene from stock centers

even basic fusions (GFP, myc, TAP etc.) often ready for you

signal.salk.edu

## You can order antibodies against your protein

several human proteins  
providers:

<http://www.scbt.com/>

[www.acris-antibodies.com/](http://www.acris-antibodies.com/)

etc.

- even get western and  
immunocytochemistry in  
advance

Plants so far lagging behind – agrisera.com perhaps little bit.  
Rather commercial service.

Light sheet microscopy – high throughput

...perhaps video will work

Tomancak lab, MPI Dresden

# Phenoscope

[PHENOSCOPE: an automated large-scale phenotyping platform](#)

Thisne et al. 2013

# Phenoscope

Automatized detection of leaf shape area and its quatification.

## Phenoscope

- leaf area (camera)
- photosynthesis (spectra)
- weight
- temperature (thermo camera)
- in a dynamic manner
- ...
- various ecotypes only, so far
- commercially promising

## Check your phenotype online

[seedgenes.org](http://seedgenes.org)

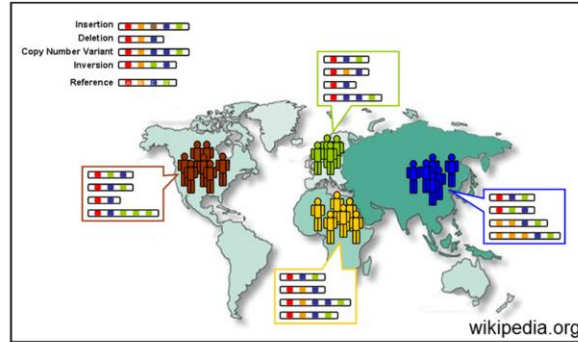

– database of plant embryonic mutants (in-dept)

<http://rarge.psc.riken.jp/phenome/>

- RIKEN Arabidopsis Phenome Information  
Database (kind of attempt on adult plant)

# 1000 genomes

1000 human genomes sequenced over the world

## 1001 genomes - Arabidopsis

<http://1001genomes.org/>

in both cases, much more lines already sequenced

## How the ecotypes are collected

Olivier Loudet web page

# 1001 genomes user interface

several single nucleotide polymorphisms (**SNP**)  
in the selected gene

What could be natural variation good for?

What could be natural variation good for?

Quantitative trait loci (QTL)

- nature makes genetic screen for you
- QTL is analogous to gene in genetic screen

## Genome wide association studies (GWAS)

Slovak et al. 2014, Busch lab, Vienna

## Genome wide association studies (GWAS)

Trait No.	Trait
1	Total length
2	Euclidean length
3	Root tortuosity
4	Root growth rate
5	Relative root growth rate
6	Root angle
7	Root direction index
8	Root horizontal index
9	Root vertical index
10	Root linearity
11	Average root width
12	Root width 20
13	Root width 40
14	Root width 60
15	Root width 80
16	Root width 100

163 accessions (ecotypes),  
several replicates (8 x 3)

searching for those different  
(say how different they might be!)

Slovak et al. 2014

## Genome wide association studies (GWAS)

Trait No.	Trait
1	Total length
2	Euclidean length
3	Root tortuosity
4	Root growth rate
5	Relative root growth rate
6	Root angle
7	Root direction index
8	Root horizontal index
9	Root vertical index
10	Root linearity
11	Average root width
12	Root width 20
13	Root width 40
14	Root width 60
15	Root width 80
16	Root width 100

163 accessions (ecotypes),  
several replicates (8 x 3)

searching for those different  
(e. g. root growth, slim root,  
resistant to exogenous treatment)

Slovak et al. 2014

## Genome wide association studies (GWAS)

high p-value => SNP specifically  
in the “resistant” line  
(*N*-way ANOVA etc.)

The phenotypic variation was 3 times associated with ecotypes having polymorphisms (“mutations”) in gene AT5G23060 above given threshold, that’s too unlikely to be an accident.

## Genome wide association studies (GWAS)

In contrast to human:  
- how to test it?

Slovak et al. 2014

You can test it by complementation (transforming with wild type DNA)..

# Genome wide association studies (GWAS) Manhattan plot by human

Status of cytosine methylations in various tissues can be explored in various tissues (human)

Epigenetic modifications

How to find methylated bases in genome?

Which bases are methylated?

# How to sequence methylation of genome?

bisulfite sequencing

What is methylation of cytosine good for?

Are there other covalent modifications?

>130 base modification detected in nucleic acids, incl. RNA  
N6-methyl adenosine most common in mRNA  
(0.5 – 5 % adenosines methylated)

### MeRIP – detecting adenine methylation on RNA

Similar technique also adapted on DNA in *C. elegans*

Greer et al. DNA Methylation on N6-Adenine in *C. elegans*, Cell 2015

The ENCODE project  
The Encyclopedia of DNA Elements

Is really only ~1 % human genome functional?  
1 % = gene coding regions

September 2012

About an ambitious high throughput initiative in human.

## ENCODE – think big

- 80 million dollars (1/2 yearly GAČR budget)
- 1,640 data sets
- 147 cell types
- Nature (6), Genome Biology (18), Genome Research (6 papers)

## The ENCODE project

Mainly cancer cells, lymphocytes etc.

RNA transcribed regions:

RNA-seq, CAGE, RNA-PET and manual annotation

Protein-coding regions:

mass spectrometry

Transcription-factor-binding sites:

ChIP-seq, DNase-seq

Chromatin structure:

DNase-seq, FAIRE-seq, histone ChIP-seq and MNase-seq

DNA methylation sites:

RRBS assay (cheaper version of bisulfite seq)

## ENCODE - summary

~80 % genome associated with biochemical function:

- enhancers, promoters
- transcribed to non-coding RNA
- 75 % genome transcribed, at least little bit
- number of recognition sequences of DNA binding proteins doubled

E. g. 75 % meaningful number?

## ModENCODE on the way

### Drosophila tissue sources:

Adult eclosion + several days  
Adult female  
Adult male  
Embryos 0-1, 0-2, 0-12, 10-12 hr etc  
Larvae in various instars  
Pupae in various stages  
Mated males or females  
etc.

<http://www.modencode.org/>

Question: where do you see the limits of high throughput biology?

## Cons

- sometimes low quality data or artifacts
- occasionally data missing
- biological material is quite complex
- what to do with so many data?
- where is the idea?

## What is systems biology

- next name for something between biology and chemistry?  
biochemistry -> proteomics  
molecular biology -> (functional) genomics
- a real new concept?

Few words about systems biology. An effort to use advanced mathematics to model – “understanding everything in organism at once”.

## “Multidimensional biology”

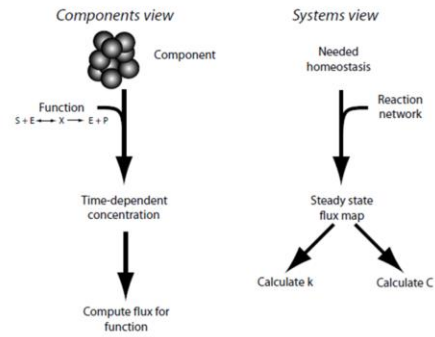

- Genomics
- Epigenomics
- Transcriptomics
- Epitranscriptomics
- Translatomics / Proteomics
- Metabolomics
- Interactomics
- Fluxomics
- NeuroElectroDynamics
- Phenomics
- Biomics

## Systems theory

Forget about **reductionism**, think **holistically**.

ὅλος [hol'-os] – greek. all, the whole, entire, complete

# Reductionism vs. holism

# Ludwig von Bertalanffy

(1901-1972)

Copyrighted material; sample page 23 of 23

**GENERAL SYSTEM THEORY**

Gathered here are Ludwig von Bertalanffy's writings on general system theory, selected and edited to show the evolution of systems theory and to present its applications to problem solving. An attempt to formulate common laws that apply to virtually every scientific field, this conceptual approach has had a profound impact on such widely diverse disciplines as biology, economics, psychology, and demography.

A German-Canadian biologist and philosopher, Ludwig von Bertalanffy (1901-1972) was the creator and chief exponent of general system theory. He is the author of ten books including *Robot, Man, and Mind* and *Modern Theories of Development*, both which have been published in several languages.

## Omic-revolution shifts paradigm to large systems

- Integrative bioinformatics
- (Network) modeling

# *E. coli* genome and proteome is small

## Reductionism within holism

Lets e.g. assume that transcription and translation is one module.

Example of module – simplifying the models.

## Conclusions – systems biology

- computing capacities allow handling large data sets
- fashionable
- modelling whole cell processes in silico?
- story frequently missing, there will be always question marks

### Great web sites for organismal models

<a href="http://www.yeastgenome.org/">http://www.yeastgenome.org/</a>	<i>S. cerevisiae</i>
<a href="http://www.pombase.org/">http://www.pombase.org/</a>	<i>S. pombe</i>
