

## Quick Reference Guide

---

### SCPI Command Summary

The following conventions are used for SCPI command syntax for remote interface programming:

- Square brackets ( [ ] ) indicate optional keywords or parameters.
- Braces ( { } ) enclose parameter choices within a command string.
- Triangle brackets ( < > ) enclose parameters for which you must substitute a value.
- A vertical bar ( | ) separates multiple parameter choices.

### *Rules for Using a Channel List*

Many of the SCPI commands for the 34970A include a *scan\_list* or *ch\_list* parameter which allow you to specify one or more channels. The channel number has the form (@*scc*), where *s* is the slot number (100, 200, or 300) and *cc* is the channel number. You can specify a single channel, multiple channels, or a range of channels as shown below.

- The following command configures a scan list to include only channel 10 on the module in slot 300.

```
ROUT:SCAN (@310)
```

- The following command configures a scan list to include multiple channels on the module in slot 200. The scan list now contains only channels 10, 12, and 15 (*the scan list is redefined each time you send a new ROUTe:SCAN command*).

```
ROUT:SCAN (@210,212,215)
```

- The following command configures a scan list to include a range of channels. When you specify a range of channels, the range *may* contain invalid channels (they are ignored), but the first and last channel in the range must be valid. The scan list now contains channels 5 through 10 (slot 100) and channel 15 (slot 200).

```
ROUT:SCAN (@105:110,215)
```
