BIOMARKERS AND TOXICITY MECHANISMS

06 – Mechanisms

Oxidative stress

Luděk Bláha, PŘF MU, RECETOX

Tento projekt je spolufinancován Evropským sociálním fondem a státním rozpočtem České republiky.

INVESTICE DO ROZVOJE VZDĚLÁVÁNÍ

Importance of redox (oxido-reduction) homeostasis

Traditional view – “too much oxidants” is bad

Prooxidants (Oxidative stress) → damage to macromolecules → death

Figure 1. Cellular redox balance control regulatory pathways determining cell viability.

Importance of redox (oxido-reduction) homeostasis

Modified view (2014) – “too much of anything is bad”

Importance of redox (oxido-reduction) homeostasis

- Redox homeostasis
 - natural homeostatic levels of prooxidants and antioxidants
 - keeping cell metabolism and signalling balanced
- Disruptions of homeostasis
 - depletion of oxygen
 - Change in metabolism, acidosis in tissues, signalling (e.g. TUMORS)
 - Less studied – new field – REDOX SIGNALLING
 - overproduction of prooxidants = oxidative stress
 - GENERAL MECHANISM OF TOXICITY AND AGEING

Pro oxidants

- **Oxygen (O₂)**
 - principal molecule in living organisms
 - terminal acceptor of electrons
 - highly reactive molecule
 - formation of reactive derivatives → ROS → toxicity
- **Other reactive molecules and ROS sources**
 - (details follow)
 - production in mitochondria (byproducts of metabolism)
 - redox-cycling (quinones of xenobiotics)
 - Fenton-reaction (metals)
 - oxidations mediated via MFOs (CYPs)
 - depletion of antioxidants (reactive molecules)

Key Reactive Oxygen Species (ROS)

SOD = Superoxide dismutase

Reduction of molecular oxygen to superoxide radical

Dismutation of superoxide radical

Transition metal catalyzed reaction
(Fenton reaction)

Haber-Weiss reaction

Me = metal (e.g. $\text{Fe}^{3+}/\text{Fe}^{2+}$)

$\text{O}_2^{\bullet -}$ = superoxide radical (superoxide anion)

OH^{\bullet} = hydroxyl radical

OH^- = hydroxyl anion

H_2O_2 = hydrogen peroxide

TERMS, NAMES, REACTIONS

Fenton reaction

(from organic chemistry classes)

$\text{Fe}^{3+}/\text{Fe}^{2+}$

But also **OTHER METALS (!)**

Reactivity of ROS (short rate \rightarrow instability = reactivity)

ROS	Antioxidant	Rate constant, $M^{-1} \cdot sec^{-1}$
Superoxide anion of oxygen	carnosine	$5.0 \cdot 10^{-5}$
	carnosine	$0.8 \cdot 10^{-5}$
	ascorbate	$2.7 \cdot 10^{-5}$
	α -tocopherol	$2.0 \cdot 10^{-5}$
Singlet oxygen	carnosine	$3 \cdot 10^{-7}$
	imidazole	$2 \cdot 10^{-7}$
	ergothioneine	$2 \cdot 10^{-7}$
	NaN_3	$44 \cdot 10^{-7}$
Hydroxyl radical	carnosine	$(5-8) \cdot 10^{-9}$
		$9 \cdot 10^{-9}$

Sources of ROS

Mitochondria

Superoxide production in oxidative respiration

Redox cycling compounds and ROS production

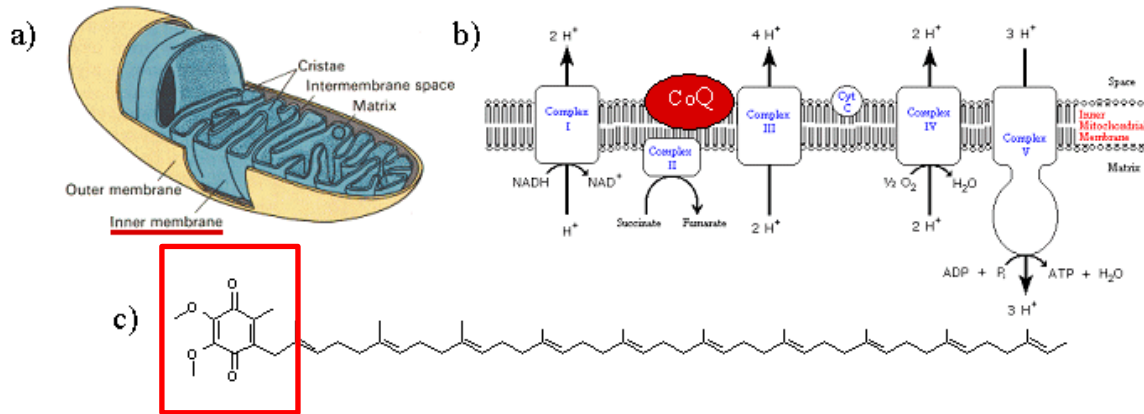

Figure 1. CoQ₁₀ is an essential component of the electron transport chain within the mitochondria.^{2,3}

Toxicity =
Interference with
“xeno” quinones
and similar compounds

Example 1 – BaP quinone

Example 2 – Paraquat pesticide

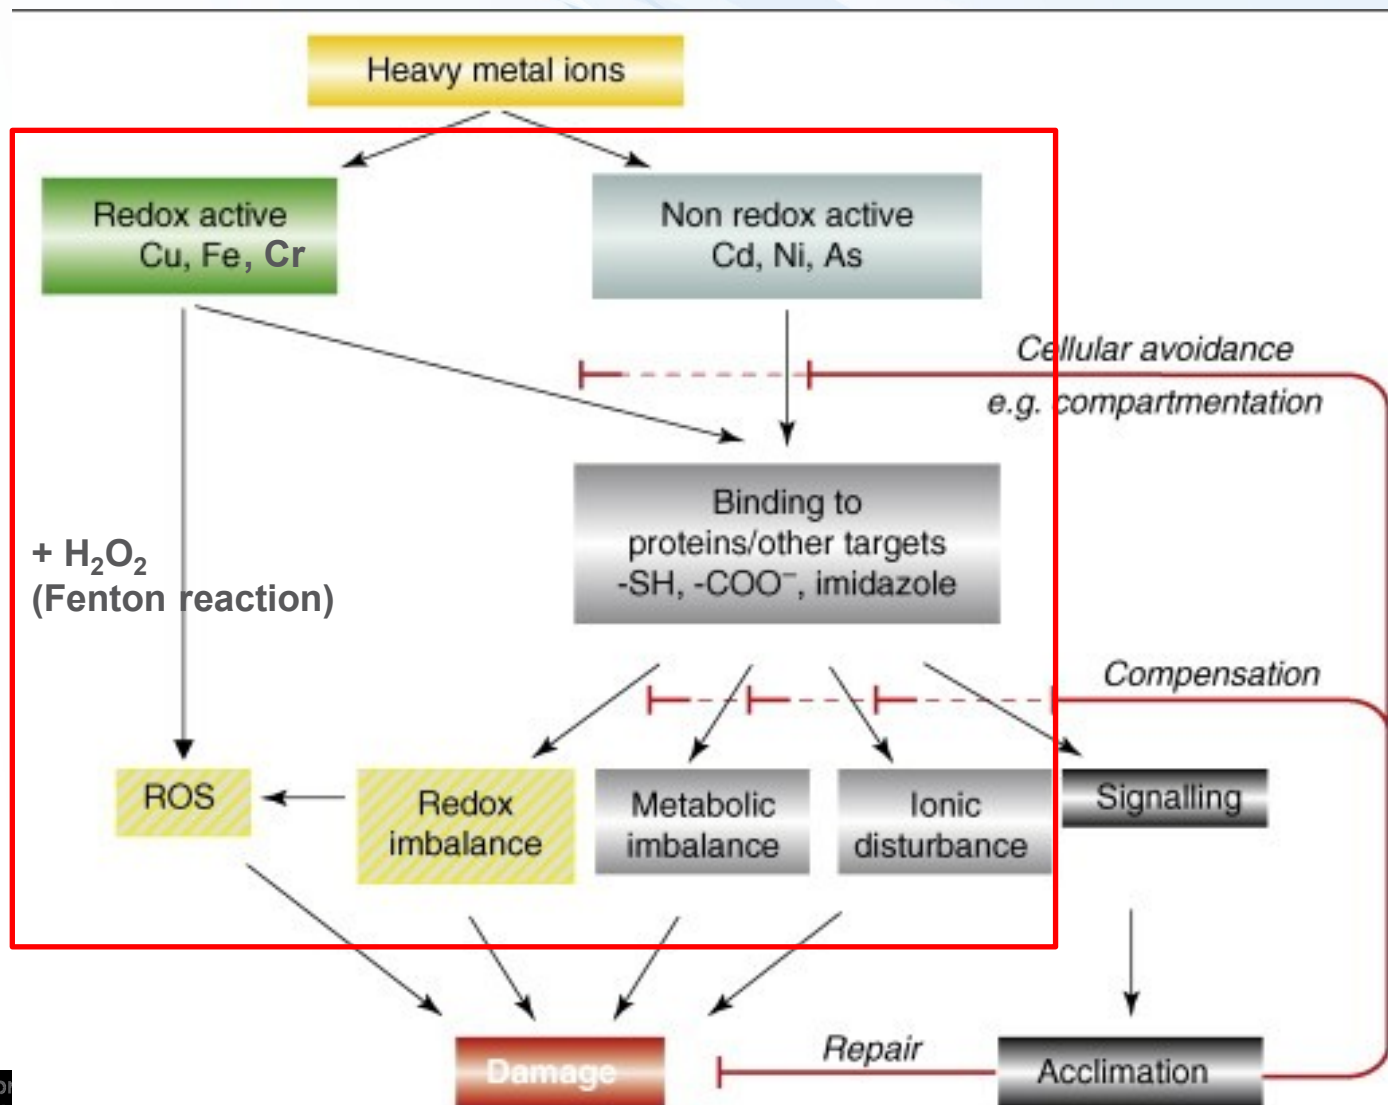

Natural cycling
quinone \leftrightarrow semiquinone

Metals and impacts on redox homeostasis

(* direct ROS production / * binding to proteins)

CYP450 as ROS source

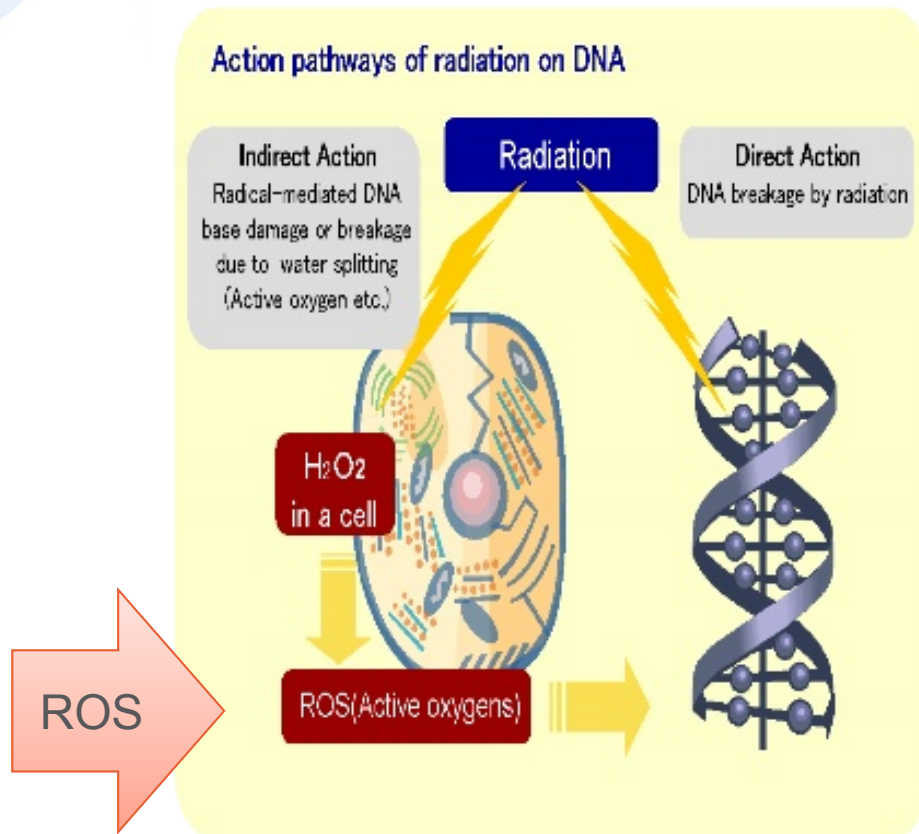

(example CYP2E1, MEOS – microsomal ethanol oxidising system)

Irradiation as a source of ROS and oxidative damage

(reminder – check lectures on toxicity towards DNA)

Mechanism of Radiation action

- ✓ The action pathway of radiation to the human body can be visualized in two ways: **one is direct action and the other one is an indirect action.**
- ✓ The direct action is **DNA breakage**. DNA has essential information to make the body. The damaged DNA would cause **apoptosis (cell death) and mutation of cells and increase a risk of diseases.**
- ✓ The indirect action is generation of radical oxygen in the human body.
- ✓ We are influenced by radiation not only through environment exposure but also through breathing air and eating food.
- ✓ **The DNA base damage mediated by radical oxygen would disturb normal cell growth and cause a functional decline of the body.**

Protection against ROS-induced damage

Antioxidant responses 1 - enzymatic

Highlighted enzymes discussed further within the „biomarker“ part

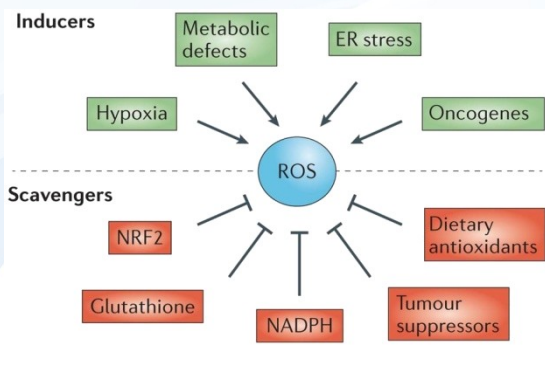

Antioxidant responses 2 – small molecules: GSH

glutathione (GSH)

Antioxidant responses 2 – small molecules: dietary antioxidants

Ascorbate

Flavonoids

Carotenoids

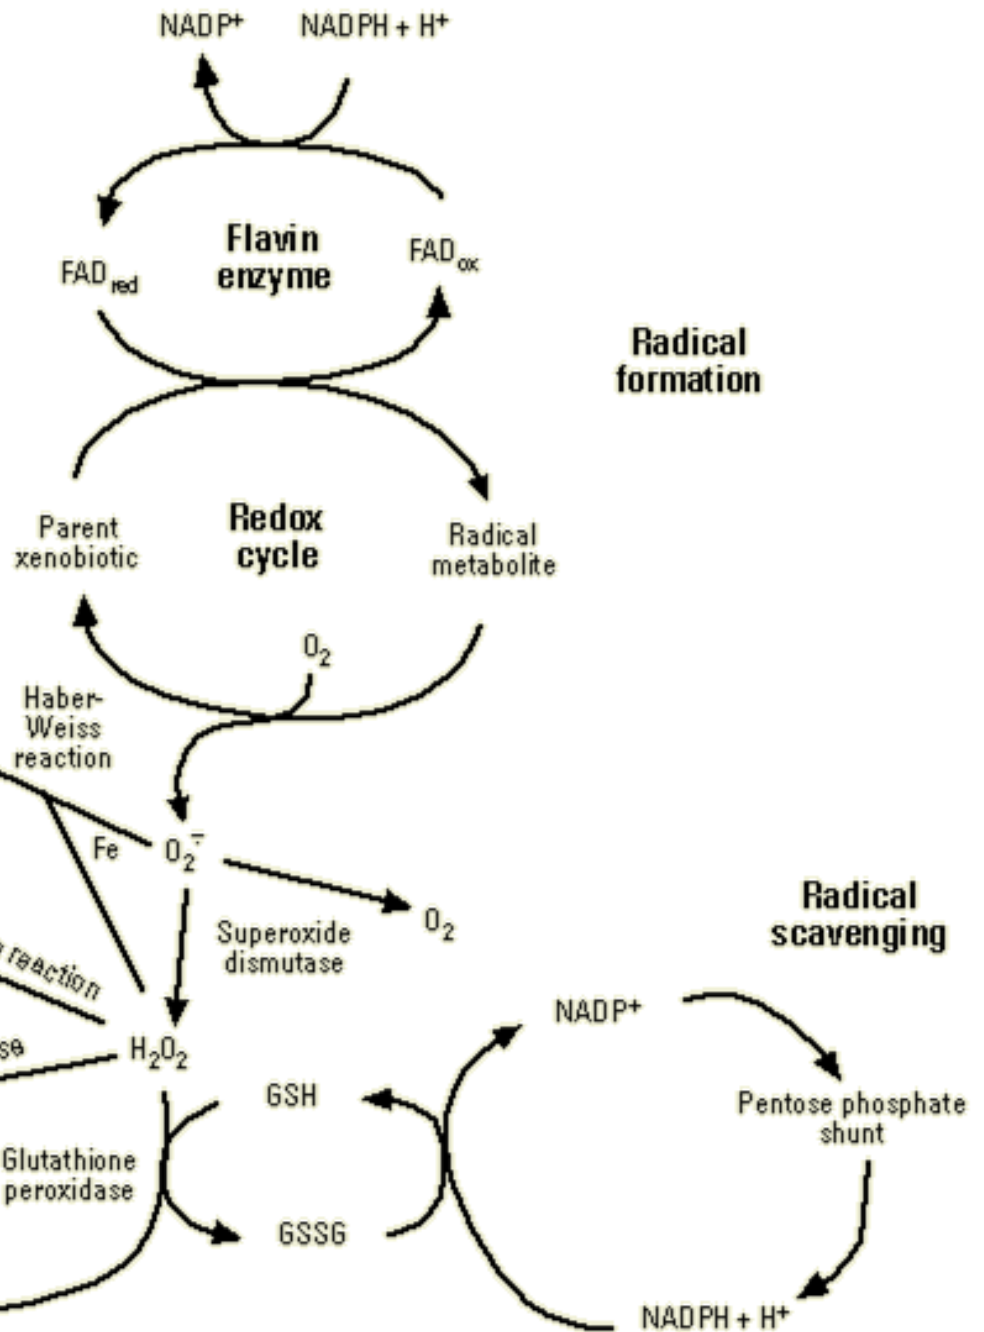

EFFECTS

Enzymes & DNA

→ Other lectures

Lipid peroxidation

→ Following slide

Lipid peroxidation = radical reaction → fast propagation

Biomarkers of oxidative damage

(will be discussed later)

BIOMARKER	AVAILABILITY	FREQUENTLY USED ASSAYS
Lipid Peroxidation		
F ₂ -isoprostanes	Plasma, urine	GC/MS, HPLC-MS/MS
Oxidized low-density lipoprotein (oxLDL)	Plasma, serum	ELISA
Malondialdehyde (MDA)	Plasma, serum, saliva, urine, exhaled breath condensate	Colorimetry, spectrophotometry, HPLC + fluorescence, GC/MS
Protein Oxidation		
Protein carbonyls	Plasma, serum	ELISA
DNA Oxidation		
8-hydroxy-2-deoxyguanosine (8-OHdG)	Plasma, serum, urine	HPLC-EC, HPLC-MS/MS*, GC/MS, Comet assay*

Health effects of oxidative stress ... multiple

e.g. acute coronary syndrome (ACS) → myocardial infarction

Diseases Related to Oxidative Stress

Figure 24-7. Pathogenesis of acute coronary syndromes. **A.** A normal coronary artery has an intact endothelium surrounded by smooth muscle cells. **B.** Endothelial cell activation or injury recruits monocytes and T lymphocytes to the site of injury, leading to development of a fatty streak. **C.** Continued oxidative stress within a fatty streak leads to development of an atherosclerotic plaque. **D.** Macrophage apoptosis and continued cholesterol deposition cause further plaque organization, and may induce the expression of additional inflammatory proteins and matrix metalloproteinases. At this stage, the cap of the fibroatheroma remains intact. **E.** Continued inflammation within an atherosclerotic plaque leads to thinning of the fibrous cap and, eventually, to plaque erosion or rupture. Exposure of plaque constituents to the bloodstream activates platelets and the coagulation cascade, with resulting coronary artery occlusion.
