

# Bioplastics and other alternatives of plastics

Helena Pokorná  
Marie Ptáčková

# Brief history of plastics

- Plastics are a wide range of synthetic or semi-synthetic materials that use polymers as a main ingredient
- Organic polymers
- Chemical modification of organic polymers
- Completely synthetic plastics

- 1839 - discovery of vulcanization process (Charles Goodyear)
- 1907 - the world's first fully synthetic plastic Bakelite (Leo Baekeland)

# Environmental effects of using plastics

- Plastics are resistant to many natural degradation processes
- Problematic of microplastics

# Solution of plastics pollution - Recycling

|  |  Chemical recycling |  Mechanical recycling |  Landfill / waste incineration |
|--|--|--|---|
| Recyclable mixed materials                             |                    |                       |                                |
| Scalable recycling solution                            |                    |                       |                                |
| Contribution to the reduction of overall CO2 emissions |                   |                      |                               |
| Huge potential for further development                 |                  |                     |                              |

# Solution of plastics pollution - Decomposition of plastics

- Photo-oxidation process
- Decomposition of plastics by various types of bacteria, fungi or larvae

# Solution of plastics pollution – Alternative materials

- Using degradable materials
- Bioplastics

# What is bioplastic?

- Biodegradable, biobased, or both

# What is bioplastic?

- Biodegradable, biobased, or both
- Bioplastics represents 1% of world plastic production

Global production capacities of bioplastics in 2020 (by market segment)

# Biobased and biodegradable bioplastics

## - two ways of production

- Polymers are extracted from biomass

- Polymers are produced by microorganisms

# Polymers extracted from biomass

## - polymers

- starch, cellulose, lignin, chitin, carrageenan, agar, ...
- casein, keratin

## - biomass resources

- land crops (corn, potato, rice), seaweed, cotton
- wood industry byproducts (wood chips, sawdust)
- food waste (corn husks, fruit peels and seeds, spent coffee grounds)

# From biomass to bioplastic

- polymer is extracted from biomass

- polymer is dissolved in water

- additional biopolymers, plasticizers, fillers are added

- melt-processing – gelatinization

- a film is made

# Currently on the market

- Starch blends (TPS - thermoplastic starch)
  - food packaging
  - poor water resistance
- Polymers from algin and carrageenan extracted from seaweeds
  - edible food packaging
- Casein protein polymers
  - adhesives, edible food packaging
  - controlled release drug delivery systems

(a) *Ulva sp.*

(b) *Kappaphycus sp.*

(c) *Gracilaria sp.*

(d) *Gelidium sp.*

(e) *Sargassum sp.*

Fig. 1. Popular seaweeds used in bioplastics production.

# Currently on the market

- Chitin based polymers
  - marine crustaceans (crab, lobster)
  - hazardous substances used for extraction
  
- Cellulose acetate
  - fibers, films
  - hazardous substances
  
- Polylactic acid

# Poly(lactic acid) PLA

- Starch cleavage by heat or acids/enzymatically to glucose
- Fermentation of glucose to lactic acid
- Polymerization of lactic acid to PLA

# Polylactic acid PLA

- Starch source: corn, cassava, ...
- Properties:
  - biodegradable?
  - degradation rate between 3-5 years
  - specific conditions (60 °C, moisture, soil or compost)
